# ENCYCLOPÆDIA BRITANNICA

## VOLUME XXXII

### THE THIRD OF THE NEW VOLUMES

**PACIFIC OCEAN, ISLANDS OF.**—For the oceanic islands of the Pacific *see* generally 20.436\*, and also the separate articles on the principal groups and islands there referred to. Supplementary information is given below, and also under GUAM, HAWAII, etc.

The so-called Four-Power Treaty was signed Dec. 13 1921, with prospects of early ratification, by France, Great Britain, Japan and the United States, the contracting parties agreeing "as between themselves to respect their rights in relation to their insular possessions and insular dominions in the region of the Pacific Ocean." A map, showing the mandate claims and sovereignties proposed, and zones of restricted fortification, will be found in the article WASHINGTON CONFERENCE.

**America Islands.**—Christmas I. was leased by a company from the British Government and planted with coco-nuts in 1904-5, but the working lapsed during the World War, and in Oct. 1919 Lord Jellicoe on H.M.S. "New Zealand" found three men who had been confined there for 18 months, ignorant of the cessation of war. The Pacific "all red" cable station on Fanning I. was wrecked by a German landing party from the "Nürnberg" Sept. 7 1914, but communication was restored by the operator. Fanning and Washington Is. belong to a coco-nut company and had in 1920 populations of a few whites and about 120 and 100 native labourers respectively. These islands are administered under the Gilbert and Ellice Is. Colony, of which Ocean I. is the administrative centre.

**Auckland Islands.**—A depot of provisions and clothes has been established here by New Zealand for shipwrecked sailors.

**Caroline and Pelew Islands.**—Japan is mandatory for these formerly German islands,<sup>1</sup> having occupied them in Sept.-Oct. 1914. The administration of Yap, which has a pop. of about 8,000 and a cable and wireless station, was at first in dispute between Japan and the United States; but in Dec. 1921 these countries reached an agreement (a formal convention to be drawn up later for signature) whereby the United States secured the same opportunities as Japan or any other nation in all that relates to cable and wireless service on the island. The pop. of the group was in 1919 about 40,000.

**Cook Islands.**—These islands, which belong to New Zealand, had a pop. of 8,764 in 1916, including 197 whites and half-castes. Eight Government schools were maintained in 1919. Revenue (year 1918-9) £13,847; expenditure £12,344, but this latter figure excludes certain salaries, etc., and about £7,500 has been contributed annually by New Zealand toward the expenditure. In 1919 exports were valued at £142,925 and imports at £127,729. Copra (to United States) and other fruit (to New Zealand) were chief exports.

**Easter Island.**—Pop. (1915) about 250, all native except an English manager. The island was visited by Mr. and Mrs. Scoresby Routledge in 1914-5 for the investigation of the ancient remains. These and other recent investigators have shown that the islanders, formerly considered to be of Polynesian race, possess an admixture of Melanesian (negroid) characteristics, and their culture reveals the same influence, notably in the bird-cult with its carved figures, partly human and partly of bird form, and in the practice of distending the ear-lobes. A close association with the bird-cult of Easter I. is found in the Solomon Is., far distant in the western Pacific. It is

suggested that the Melanesian immigrants who carried this cult to Easter I. were followed by Polynesians, who fought but did not exterminate them, and there remain indications of a division of the island between the two stocks. While it is impossible to assign any date for the Melanesian immigration, it has been suggested that the Polynesian took place about the beginning of the 15th century A.D., but the further evidence collected on Easter I. in 1910-20 has not determined to which group of immigrants the megalithic remains are to be attributed, or cleared up the origin of the ideographic script found on tablets in the island.

**Fiji.**—The pop. of the Fiji Is. was estimated on Dec. 31 1918 at 163,416, including 87,761 Fijians, 2,100 natives of Rotumah, 2,709 natives of various Polynesian islands, 61,745 Indians, 4,748 Europeans, 2,803 half-castes and 913 Chinese. The revenue in 1918 was £371,189, and the expenditure £342,140. Exports in 1919 amounted in value to £1,871,062, of which £882,574 went to New Zealand and £584,067 to the United States of America. About half the exports (by value) consisted of sugar, most of which went to New Zealand. There has been shortage of labour, the importation of Indian contract labour having been stopped in 1916; but arrangements are made to admit free Indian labour. Prices have ruled low in comparison with expenditure and planters have expressed dissatisfaction with the fixation of the price for one year only, by the controlling exporting company. Copra, bananas, molasses and rubber are the other chief exports. Imports were valued in 1919 at £1,060,314, of which £513,547 came from Australia, but the goods thus indicated were in great part reexports and largely of British origin.

Down to 1916 the education of the natives was wholly under missionary control, save for the Government high school at Nasinu, Suva, and the native high school at Laieba. But in that year an Education Act rendered all schools complying with certain conditions eligible for Government aid. Suva has a high-power wireless station, and there are four inter-insular stations.

**Gilbert and Ellice Islands.**—These became a British colony in 1915-6, having been previously a protectorate. Estimated pop. Gilbert I., 30,000; Ellice I., 3,000. Revenue (year 1918-9) £24,450; expenditure £30,734. In the year 1917-8 copra of the value of £63,465 was exported from the colony, and 82,845 tons of phosphates, valued at £83,000, from Ocean I.; but this latter export was expected to reach 200,000 tons in 1920-1. Ocean I. is the headquarters of the Government, and a wireless station was opened there in 1916. The administration includes the America Is. and the Tokelau (Union) Is. between 8° 30' and 11° S. lat. and 171° and 172° W. long. The Tokelau Is., total area 7 sq. m., had a pop. of 912 natives and 2 Europeans in 1911. The Gilbert islanders have lost their warlike reputation, and are all, at least nominally, Christian.

**Lord Howe Island,** belonging to New South Wales, was placed under a board of control with office at Sydney, as the result of the report of a Royal Commission on the trade of the island in Kentia palm-seeds in 1912. A local advisory council assists the board.

The **Lord Howe Group**, also known as Ongtong Java, has a Polynesian pop. estimated at 1,200 (5,000 in 1905), and produces copra.

**Loyalty Islands** (dependency of New Caledonia), pop. (est., 1919), 11,000.

**Macquarie Island** is annexed to Tasmania. In connexion with the Mawson Antarctic expedition (*see* 21.968) a meteorological and wireless station was established there.

**Manihiki Archipelago.**—Of the scattered islands mentioned under this heading, Caroline, Vostok, and Flint are leased from the British Government by a coco-nut company; the rest are dependencies of New Zealand. Suvarov has a fine harbour, though with a shallow

<sup>1</sup> Statistics of the separate ex-German possessions in the Pacific are not available. Exports for them all, excepting Samoa but including New Guinea, were valued in 1913 at £595,000; imports at £450,000.

\* These figures indicate the volume and page number of the previous article.

entrance, and a part of Anchorage Islet on the reef is held by the Lords Commissioners of the Admiralty. The island is leased to a coco-nut company, but producing little owing to destruction by hurricane, and the pearl fishery has deteriorated. At Manihiki I. (pop. in 1916, 775) the pearl beds were closed when almost worked out, and at Penrhyn I. (pop. in 1916, 312) production fell off.

**Marianas.**—The former German islands (excepting Guam [see GUAM], which belongs to the U.S.A.) were occupied by the Japanese in 1914, and were given to them under mandate in 1918.

**Marquesas Islands.**—The Polynesian pop. has continued to diminish, and was estimated in 1920 to be less than 3,500. The French administration (established at Hivaoa) was stated to neglect the commercial development of the islands, though in 1913 a German trading company was established there.

**Marshall Islands.**—These islands, formerly German, were acquired by Japan under mandate in 1918. From 1888 to 1906 they were administered by the Jaluit Trading Co., of Hamburg, under agreement with and subsidized by the German Government. The Government itself subsequently administered them down to 1914. A recent estimate indicates a decreasing pop. numbering 9,200.

**Nauru.**—This island, in 0° 33' S. lat., 166° 55' E. long., was administered along with the Marshall Is. by the Germans, but the phosphate deposits for which it is important were worked by a British company under agreement with the Jaluit company. The island surrendered to a vessel of the Australian navy in Sept. 1914 and came under British mandate in 1918. Pop. (1916), 1,284 natives, 449 Caroline islanders, 278 Chinese, 90 whites. The white settlement is at Yangor, where the phosphate company had its stores and drying plant. The deposits on the high ground (78 to 88% phosphates) are transported by light railways worked by steam, gravity, or electricity, and are shipped by surf-boats from two wharves. Under the Nauru I. agreement, 1919, between the British, Australian and New Zealand Governments, it was enacted that the Australian Government should appoint an administrator for a term of five years, that each of the three Governments should appoint a member of a board of commissioners, that the phosphate company should be bought out by the three Governments and the deposits and their workings should be vested in the board, and that the expenses of the administration, so far as not otherwise met, should be paid out of the sale of the phosphates. The island also yields copra. A wireless station was established by the Germans in 1913.

**New Caledonia.**—Pop. (census of 1911), 50,608, including 28,075 natives, 19,319 whites, and 3,214 Asiatic immigrants. Nouméa contained 8,961 inhabitants, including 5,207 free whites, 1,245 convicts, 1,999 natives and other coloured people, and 396 troops. Among other centres of population, Thio on the E. coast is the chief nickel-mining centre, and Paagoumene on the W. coast the chief chrome-mining centre. Exports from New Caledonia and dependencies were valued in 1913 at £633,536 (copra, £67,932); imports at £708,316. The guano workings of Walpole I., 150 m. E. by S. of Nouméa, have been recently developed by a company.

**New Hebrides.**—The pop. has been recently estimated at 65,000 natives and 800 Europeans. Exports in 1919 were valued at £364,000 (copra, £134,300; cocoa, £79,000); imports at £166,847. The Anglo-French condominium is not generally regarded as successful. According to a report of 1918, the confusion between the operations of this tribunal, the French and British courts, and the joint naval commission for native litigation, gave rise to complaints.

French settlers are said to hold the best land as a rule, though in the Banks and Torr Is. British interests are the stronger; trade has been fostered mainly by French interests. The volcano of Ambrym Is. was in eruption on and after Dec. 6 1913, and caused damage.

**Niue.**—Pop. (1919), 3,664, including 20 whites and 160 half-castes. Exports (about six-sevenths copra) were valued in 1919 at £35,977, and imports at £21,783. The New Zealand Government contributes about £3,000 a year to the administration. A hurricane in 1915 severely damaged the coco-nut plantations, but 15,000 nuts were planted in the course of peace celebrations.

**Norfolk Island.**—Pop. (Dec. 1918), 815. The executive council now consists of six elected members and six members appointed by the administrator. It was reported in 1919 that the Melanesian Mission established here in 1867 was contemplating the removal of its headquarters. Exports were valued in 1919 at £5,238 (lemons, passion-fruit pulp, fish and whale products); imports at £13,398.

**Palmyra or Tuamotu Archipelago** (the latter is the proper form, and is used throughout this part of the Pacific).—Pop. (1911), 4,581. Makatea (pop. 866) has become the most important island, owing to the working of phosphates, and is administered separately. It is an elevated coral island, unlike the other coral islands, which are atolls. From these, copra and pearl-shell are the chief exports. The dependent Gambier Is. yield the same commodities, but poorly, and their inhabitants are decreasing in numbers and physique.

**Phoenix Islands.**—The majority have been leased to the Samoan Shipping and Trading Co. for coco-nut planting.

**Rotumah (to Fiji).**—Pop. (1918), 2,263.

**Samoa.**—The former German islands of western Samoa were occupied by a New Zealand expeditionary force on Aug. 30 1914. Although it was stated that there was some feeling in the islands against permanent administration by New Zealand, a mandate for

them was given to that Dominion in 1919. The native pop. in 1918 was 30,636 after the epidemic of influenza in that year, which caused over 8,000 deaths. There were also 1,660 white men and half-castes, and 1,166 labourers imported under indenture. The shortage of labour is particularly acute. The Deutsche Handels- und Plantagen-Gesellschaft (German trading and plantation company), which held 8,820 ac. under the German Government, went into liquidation in 1916, and its holdings and other German plantations were taken over by the Government of New Zealand. Exports in 1919 were valued at £532,500, over four-fifths of the total value being in copra, which went chiefly to the United States. In 1918 exports were valued at £306,640; imports (mainly from the United States and New Zealand) at £319,521. Revenue for one year 1919-20 was estimated at £80,215, and expenditure was expected to balance this. Apia has a wireless station. The pop. of the American Samoan islands was estimated in 1920 at 7,550. Copra is practically the only export. There is a high-powered wireless station at Tutuila.

**Society Islands.**—The pop. of the whole of the French establishments in Oceania in 1911 (including the Society, Tubuai, Tuamotu and Marquesas groups) was 31,477, including 2,656 French, 484 British, 237 Americans and 975 Chinese: there appears to have been a large influx of the last since that date. A later estimate ascribes 11,000 inhabitants to Tahiti alone, but 4,000 lives were lost in this and adjacent islands in the influenza epidemic of 1918. Papeete, the capital (pop. in 1911, 4,099), was bombarded by German cruisers on Sept. 22 1914. Exports were valued in 1917 at 11,997,461 francs (chiefly copra, pearl-shell, and vanilla), and imports at 7,806,294 francs. Papeete has a wireless station.

**Solomon Islands.**—The native pop. has been recently estimated at 150,000, the whites at 800, and there are a few Chinese. For the year 1918-9 revenue amounted to £29,476; expenditure to £30,205; exports were valued at £170,125; imports at £188,408. The natives are for the most part wild and backward, and the labour question is serious. For the (formerly) German Solomon Is. see NEW GUINEA.

**Tonga.**—Pop. (1919), 22,689 natives, 350 Europeans. The influenza epidemic of 1918 is said to have caused 1,000 deaths. The native government, under the king, consists of 32 nobles and the same number of elected members. The land is vested in the sovereign, but all his subjects hold some of it, and there is no pauperism or public debt. British officials assist the administration. The revenue in 1918 amounted to £58,340, and expenditure to £35,865. The value of exports in 1918 was £169,758, nearly the whole consisting of copra. Imports in 1918 were valued at £177,152. The copra is chiefly exported to America; imports are received mainly from Australia and New Zealand.

**Tubuai Islands.**—Pop. (1911): Ravaivai, 432; Tubuai, 543; Rurutu, 911; Kimitara, 415; Rapa, 183. Rapa, possessing a fine natural harbour in Ahurei Bay, has been spoken of as a possible trans-oceanic port of call for which purpose it was used in 1867-9. The island is volcanic, and the bay represents the old crater. The natives are noted sailors and are in demand for the crews of vessels.

**Wallis and Horne Islands.**—These, formerly a French protectorate, have been declared a colony. When this annexation was proclaimed in 1913, opposition to the proclamation was fomented by Roman Catholic missionaries in Fotuna (Horne Is.), and even in Uvea (Wallis), where the native chiefs had asked for the annexation, a retention of native law was stipulated, and native law could be only gradually replaced by French law. (O. J. R. H.)

**PADEREWSKI, IGNACE JAN** (1860- ), Polish pianist and diplomat (see 20.443), after the outbreak of the World War in 1914 gave numerous benefit concerts in America for Polish sufferers and delivered addresses in their behalf. He was appointed plenipotentiary in America for the National Polish Committee, which early had won official recognition by the Allies.

Among the Poles in America—some millions—there was great dissension as to the means of gaining independence for Poland. With rare skill he induced the stubborn factions to accept the authority of the National Polish Committee, of which he was the most influential member in Paris. In the words of Mr. Robert Lansing, who, as a peace delegate, came into constant contact with him there, he was "an able and tactful leader of his countrymen and a sagacious diplomat." He was among the statesmen, who, in Paris, Dec. 1918, formulated the terms of the Peace Treaty. Meanwhile discord had arisen between the Polish Government and the National Committee. At the close of the year Paderewski returned to Poland and was received in triumph. In Jan. 1919 an agreement was reached with Gen. Pilsudski, whereby Paderewski headed a new coalition cabinet as premier and minister for foreign affairs. In this capacity he signed, Dec. 28 1919, the Treaty of Versailles. He resigned as premier in Dec. 1919. It was generally felt that he had been more successful as a diplomat than as an administrator. In an interview given to newspaper reporters after his return to America in Feb. 1921, he asserted that he would never again appear in piano recitals. His last professional appearance as a pianist had been at the Metropolitan Opera House in New York, May 9 1917.

**PAGE, THOMAS NELSON** (1853- ), American author and diplomatist (see 20.450), was appointed ambassador to Italy by

President Wilson in April 1913. In 1914 he announced his discovery of the house, 66 Piazza di Spragna, in which Byron had lived at Rome in 1817. In 1915 he induced the Italian Government to raise the ban on the reexportation of cotton goods routed by American shippers via Italy to other countries. He earned the gratitude of the Italians by his relief work during the Avezzano earthquake in 1917. After America entered the World War he defended Italy against the charge of backwardness in conducting her campaign by pointing out the obstacles confronting her soldiers in the Alps.

He resigned as ambassador in April 1918 and returned to America. His writings after 1910 included *Robert E. Lee, Man and Soldier* (1912); *The Land of the Spirit* (1913); *Tommaso Jefferson, Apostolo della Libertà* (1918, prepared for an Italian series); *Italy's Relation to the War* (1920) and *Italy and the World War* (1921).

**PAGE, WALTER HINES** (1855-1918), American editor and diplomatist, was born at Cary, N.C., Aug. 15 1855. After graduating from Randolph-Macon College, Va., in 1876, he was appointed one of the first 20 fellows of the newly established Johns Hopkins University. He taught for a time in Louisville, Ky., and then accepted the editorship of the St. Joseph, Mo., *Daily Gazette*. After two years (1881) he resigned to travel through the South, having arranged to contribute letters on southern sociological conditions to the *New York World*, the *Springfield Republican* and the *Boston Post*. These letters were helpful in educating the North and the South to a fuller understanding of their mutual dependence. In 1882 he joined the editorial staff of the *New York World* and wrote a series of articles on Mormonism, the result of personal investigation in Utah. Later in the same year he went to Raleigh, N.C., where he founded the *State Chronicle*, but returned to New York in 1883 and for four years was on the staff of the *Evening Post*. From 1887 to 1895 he was, first, manager and, after 1890, editor of *The Forum*, a monthly magazine; and from 1895 to 1900 was literary adviser to Houghton, Mifflin & Co., and for most of the same period editor of the *Atlantic Monthly* (1896-99). When the house of Doubleday, Page & Co. was organized in 1899, his duties were divided between editorial and publishing work, for he was not only a partner in the publishing house but also editor of its magazine, the *World's Work*. In March 1913 President Wilson appointed him to succeed White-Law Reid as ambassador to England.

Mr. Page was hardly known in England when he was appointed, but during his tenure of office he gradually established himself as one of the great line of American ambassadors. None had ever worked more assiduously than he did for Anglo-American solidarity, and his speeches—though he was no orator—were always marked by absolute sincerity and by well-informed appeals to history. His position was a delicate one after the outbreak of the World War, when German and Austrian interests in England were placed in his hands. He was thoroughly loyal to his country in his conduct, although sympathetic with the Allies. Among the problems with which he had to deal were the British claim of the right to stop and search American ships, including examination of mail pouches; the commercial blockade (1915) and the "blacklist," containing the names of American firms with whom all financial and commercial dealings on the part of the British were forbidden (1916). He had the satisfaction of seeing the United States through its period of neutrality without friction, and then representing it as a partner in the war. In Aug. 1918, finding his strength exhausted, he resigned as ambassador and returned to America in September. He was critically ill on arrival, and after a short rally died at Pinehurst, S.C., Dec. 21 1918. No man ever served his country, or the cause of Anglo-American friendship, more strenuously. While in Great Britain he was honoured with degrees by the universities of Aberdeen, Edinburgh, Sheffield, Cambridge, and Oxford. He was the author of *The Rebuilding of Old Commonwealths* (1902) and *The Southerner, a Novel: Being the Autobiography of Nicholas Worth* (1909).

**PAGET, FRANCIS** (1851-1911), English divine, was born March 20 1851, the second son of the surgeon Sir James Paget (see 20.451). His brothers, Sir John R. Paget, 2nd Bart., the

lawyer (b. 1848), the Rt. Rev. Luke Paget (b. 1853), who was Bishop of Stepney, from 1909 to 1919, and was then translated to the see of Chester, and Stephen Paget, the surgeon and author (b. 1855), all became well-known men. Francis Paget was educated at Shrewsbury and Christ Church, Oxford, where he had a distinguished career, taking first classes in classics, winning the Hertford scholarship (1871) and the chancellor's Latin verse prize (1871); he was elected senior student of Christ Church (1873) and tutor (1876), taking holy orders in 1875. In 1885 he was appointed regius professor of pastoral theology, and in 1892 dean of Christ Church. He contributed the essay on the sacraments to *Lux Mundi*. He became Bishop of Oxford in 1901, and was a member of the Royal Commission on Ecclesiastical Discipline 1904-6. He died in London Aug. 2 1911.

**PAGET, LOUISA MARGARET LEILA WEMYSS, LADY** (1881- ), was born in London Oct. 9 1881, the daughter of Sir Arthur Henry Fitzroy Paget (b. 1851), a descendant of the 1st Marquess of Anglesey. She married in 1907 a connexion of her own, Sir Ralph Spencer Paget, who had a distinguished career in the diplomatic service, and was from 1916 to 1918 minister to Denmark and from 1918 to 1920 first ambassador to Brazil. In 1915 Lady Paget organized a Red Cross hospital for service in Serbia, and was stationed at Uskub, having to remain there when the town was occupied by the Bulgarians, Oct. 1915. She was allowed to use her stores for the relief of refugees, and relieved a great deal of suffering. In Feb. 1916 she was transferred to Sofia, and in April returned to England. In 1915 she was invested with the order of St. Sava by the Serbian Government and in 1917 received the G.B.E.

**PAINTING** (see 20.459).—The end of the 19th century saw in painting the triumph of "impressionism" in its widest sense and the reproduction of visual appearance as a whole accepted as the main business of a painter.<sup>1</sup> But with the heterodoxy of the 19th century become the orthodoxy of the 20th, another movement has arisen in revolt against impressionism, giving to painting between 1900 and 1921 its distinctive character: and just as the victory of impressionism was a French victory, so this new movement is mainly French in origin, though its manifestations elsewhere have taken colour from national characteristics. The change in the centre of gravity of art has, however, been greater in appearance than reality. The older academic traditions still survive; and advances by official bodies and the public have been met by concessions to orthodoxy among some followers of 19th-century heretics.

Across these main movements has cut the influence of the World War. At first it threatened to limit artistic output severely, but the check was only temporary. A huge demand arose in the belligerent countries from individuals and public bodies for illustrative, propagandist or commemorative work, which bore fruit in posters and cartoons; in the formation of official collections such as the Canadian War Memorials and a section of the Imperial War Museum; and in decorative paintings for memorial purposes, such as have been commissioned in France by the State and municipalities. The chief interest of this work is that of a document, showing what men did, felt and thought during the war, and of giving a summary of the condition of art at the time in various countries. The aim of the British and Canadian official collection was definitely to preserve a pictorial record of the war in all its aspects, and, consequently, much of the work is only the skilful application of a technique to a set task, and not the expression of a new vision. The same applies to most of the memorial decorations produced in France; only some etchings and lithographs produced independently of official action show any really personal emotion. Similarly, though in all countries the posters were the work of prominent artists, little

<sup>1</sup> Unfortunately for clarity of exposition, the term "impressionism," originally applied to the group of artists round Claude Monet, painters in a high key using a palette limited to white and the spectral colours, has been given a wider meaning, especially in England. To avoid mistake, the term is here used throughout to describe that group and their followers, and does not cover painters such as Monet in his early period, or Whistler, whom the wider significance might include.

really notable work from an aesthetic point of view appeared. Designed as they were to excite hatred, cupidity, pity and self-sacrifice, their appeal could only in part be aesthetic, and, like the paintings, they showed little more than the application of familiar and matured methods to a special end. Yet by putting the production of the poster into the hands of artists, and by helping to revive and stimulate wood engraving and lithography, the war has had real influence on the graphic arts. Otherwise, its immediate effects have been small. It has quickened a movement towards expression of a national spirit in art, by throwing countries back upon their own resources, and by increasing a desire to assert national superiority. It may also have given a new impulse to the modern search for structure and design, by reducing life so much into terms of machinery and organization; and because of the depth and variety of the emotions it aroused, may have stimulated the tendency to use form and colour for the expression of personal feeling rather than for the reproduction of nature. Probably, too, by making a definite breach with 19th-century ideas, the war has cleared the way for the development of new aesthetic standards. But the most important modern movements in art were in being before the war.

*Impressionism.*—Of movements which attained full development in the 19th century, impressionism in its purest form was still represented in France in later years by Claude Monet, in Belgium by Emil Claus, and in England by Lucien Pissaro. Of its many developments and adaptations, neo-impressionism—based on the analysis of colour in nature into its constituent elements, which are then placed by means of juxtaposed spots of paint upon the canvas, to be recombined by the eye—survived in 1921 only in modified form. Paul Signac, one of its original exponents, had substituted for spots brick-like rectangles in his oil paintings, and increased use of line in his water-colours; while its conversion into pointillism (simply a method of applying in spots colour already mixed on the palette) was represented by Henri Martin and Henri le Sidaner. Paul Albert Besnard showed impressionism adapted to deal with such complicated problems as a mixture of twilight and artificial light; but with Wilson Steer the expression of subtle tone relations with a limited palette including black had superseded an impressionist technique. In England, indeed, the spectral palette and high key has been only a passing phase with most painters, and it is the impressionism of Whistler and the earlier Manet, with its study of tone and decorative arrangement of silhouette, which has obtained most adherents. This was seen in its purest form in France in the work of Jacques Émile Blanche; but it provided a common basis for the members of the Glasgow school, such as Sir James Guthrie, E. A. Walton, Sir John Lavery and D. Y. Cameron; and brought into relation with them Sir William Orpen, whose use of colour and study of light otherwise connect him with the impressionists. Similarly J. S. Sargent's portraits carried on one side of the Manet tradition, though elsewhere he showed impressionist influence. Of the group of painters who, under the influence of Millet and Bastien-Lepage, carried the realism of Courbet and Manet into the field and workshop, the chief survivors in 1921 were Lucien Simon and Charles Cottet in France, Max Liebermann in Germany, Joaquín Sorolla in Spain and Ettore Tito in Italy. In England the once prominent Newlyn group had fallen by 1921 into obscurity; in Sweden Anders Zorn, best known by his portraits and etchings, was dead; and the Hague School of Holland had no important living representatives.

*Transition Painters.*—Between these representatives of the 19th-century outlook and those of the modern movement stand many painters combining in varying degrees characteristics of both groups, such as Sir C. J. Holmes (Director of the National Gallery from 1916), whose landscapes are marked by simplification and emphasis on structure. Transition to the modern point of view is also represented by the decorative painters, who have necessarily never fully accepted impressionism and realism. As early as 1892 the *Rose Croix* group had urged that painting should be idealist and monumental in character, with myth and allegory as its subject. These ideas survive, despite impressionist influences, in the balanced and harmonious compositions of

René Menard, whose descent is from Puvis de Chavannes, in the mural decorations of Henri Martin, and in the work of Aman-Jean, whose flowing arabesque relates him to the 18th-century decorators. Akin to these painters, but closer to the modern movement and more purely decorative in intent, is the broadly handled work of Jules Flandrin (b.1871). Another group of decorative painters take realism as a starting-point. Among these is Frank Brangwyn (b.1867), one of the few English painters with considerable European influence and reputation. His later work—such as the eight mural paintings, symbolizing the dynamic forms of nature, for the 1915 Panama Pacific Exposition—shows how his dexterous and schematized art combines romantic and allegorical treatment of material drawn from the daily life of commerce and industry with a sensuous materialism. A comparable figure is Ignacio Zuloaga (b.1870), the leader of a group of Basque and Castilian painters, including Ramon and Valentine de Zubiaurre, Gustavo de Maeztu and Federico Beltran-Masses, representing the regionalist and consciously national character of modern Spanish art. Here a romantic conception of subjects drawn from contemporary Spanish life is given decorative form by emphasis on silhouette, simplification of form and broad masses of colour, often combined with a low horizon and a panoramic background; though sometimes the realism degenerates into caricature and the decorative treatment into the production of cardboard figures against a stage drop-scene. Augustus John (b.1879) in England is not romantic, but combines with the realism which finds most complete expression in his portraits a strongly decorative aim in the use of contour to enclose definite areas of colour, and distortions of the human figure in the interests of design. Similarly, the Munich decorative school, still represented in 1921 by its most important product, Franz Stuck (b.1863), inherits from Böcklin the realistic treatment of mythological and allegorical materials. Its once important and widespread influence has waned; but it forms part of the bridge between the archaeological and historical painting which formerly dominated Germany, and more modern movements. Allied thereto is the Swiss, Ferdinand Hodler (1853–1918), by the emphasized contours and calculated distortions of his later work. But in his symbolic mystical outlook he resembles another important forerunner of the modern movement, Hans von Marées (1837–1887), neglected in his lifetime but now the object of much adulation, who turned from Courbet and Manet to Rubens and Delacroix in developing a monumental decorative art based on three-dimensional form.

Another important divergence from the main trend of later 19th-century art is represented in France by H. G. E. Degas (1849–1917) and Pierre Auguste Renoir (1841–1919). Their close association with the impressionists was reflected in the choice of subjects from contemporary daily life and at times in their use of colour; but here the connexion ends. Degas is a descendant of the great classic draughtsmen. A convinced realist, bitterly opposed to the romantic and symbolic, he never sought the ideal beauty of Ingres, but turned to use the more absurd and bizarre attitudes of everyday life. But his realism is synthetic, and represents the building-up, from many sketches and from a retentive memory, the essential character of a form or movement; and his vision is classic in its impersonal, almost ironic, quality. So with his design, which, despite its apparent disregard of the rules of classical composition, yet shows a complete balance of strains and stresses round a pictorial centre, revealing the influence of Chinese and Japanese art. Round Degas centres a group of realistic draughtsmen, such as Henri de Toulouse-Lautrec (1864–1901), whose fevered and excited vision has inspired much modern work, Louis Legrand and J. F. Raffaelli. Jean-Louis Forain (b.1852), chiefly known for his political and social cartoons, has the critical and ironic spirit of Degas, but less power of design and feeling for colour. The later work of T. A. Steinlen (b.1859), likewise well known by his journalistic work, is significant of modern tendencies in the increased emphasis given to the third dimension and the use of simplified forms. In England the realism and irony of Walter Sickert (b.1866) connect him with Degas, though his search for atmospheric

unity by study of tonal relations, and an incursion into the use of the spectral palette under the influence of Spencer Gore, bring him nearer the impressionists. He has played an important part in English art by transmitting French influence, coloured by his own personality, to a number of younger men. Henry Tonks (b.1862), professor at the Slade School, London, has also played an important part in moulding the younger generation. His realism and draughtsmanship relate him to Degas, his choice of subject at times to Renoir. Renoir, unlike Cézanne, to whom he is most immediately comparable, has inspired no particular group who call him master. He was first and last a painter, not the exponent or founder of an aesthetic creed. Rejecting Monet's principle of unconditional submission to nature, and holding that the work of a painter was not to reproduce a natural effect but to compose and construct, he grafted impressionism on to the tradition based on the Venetians and Rubens and revived by Delacroix; forming an art in which solid form, simplified to its most expressive elements, and rhythmic flow of contour unite to give his work the plastic quality of a bas-relief. His colour, always daring and exuberant, in his later work becomes less naturalistic, and is dominated by the famous Renoir carnation, which gives his canvases a radiance in accord with his vision.

*Etching and Engraving.*—In etching and engraving, broadly, the 19th-century tradition originating in Rembrandt and Goya still holds the field, represented by Georges Göbo in France, Otto Fischer in Germany, Sir Frank Short, Muirhead Bone and D. Y. Cameron in England. Confined as a rule to landscape or architectural work, their work is chiefly notable for technical mastery. Representatives of the modern school, on the other hand, rarely realize the full possibilities of the medium. In Odilon Redon (1840-1916), however, a modern aim is united with the older craftsmanship in his search for a plastic equivalent of his emotion and dreams. He was one of the pioneers of that revival of lithography in which bodies such as the Senefelder Club, whose members include Joseph Pennell and Brangwyn, played a part. A more important revival is that of engraving upon wood, with which Auguste Lepère (1849-1918) was closely associated. His later woodcuts show a return from a technique imitating etching or engraving on metal to the older method of treatment in broad masses, the lights being obtained by cutting away the wood. In Paris and London societies of wood engravers have been formed whose members practise this traditional use of white upon black, which is also much favoured by such modern artists as Derain, Dufy, Friez, and Franz Marc in their book illustrations.

*Contemporary Movements.*—The modern movement, some of whose characteristics appear in the transition painters already discussed, has been given various labels, such as post-impressionism and expressionism, but its manifestations are so various that no one term can satisfactorily describe it. But these manifestations have a common origin and character, in being a reaction against impressionism, with its aim of representing superficial appearance as a whole at a given time, without reference to shape or appearance as they are known to exist under the conditions; and in proposing to substitute form arranged into a coherent design, so making a new and independent reality and not a reproduction of nature. In this the modern movement claims to be a return to the tradition in painting represented by Raphael, Poussin, David and Ingres, as opposed to the romanticists and realists; and to be breaking away from subordination to external and visible things, which are to serve only as a means towards expressing the artist's emotions. From this latter aspect of the movement arises the term "expressionism"; and divergence as to the kind and quality of emotion to be expressed is one cause of the differences between various modern groups. This general character of the movement helps to account for other distinctive features. Colour becomes less naturalistic, and is either used to emphasize the solidity of objects, is purely decorative, or assumes a mystical and symbolic character; and anxiety to avoid a transcript of nature has stimulated return to the subject picture, which calls for constructive effort. But the modern movement owes much to the impressionists. It was they who helped to discredit the formulas and aims of academic art; put powerful

weapons in the painter's hands by applying to art scientific discoveries regarding light and colour; and won recognition of the artist's freedom to express his personal vision of things. It was on this basis that the chief initiators of the movement built. These fall into two groups, the one including Cézanne, Seurat and Henri Rousseau, whose emphasis tends to be on structure and organized design; the other including Gauguin, Van Gogh and Gustave Moreau, in whom symbolist and expressionist elements are more marked.

Paul Cézanne (1849-1906) gives the key to understanding of his aims and methods by his own words, that he wished to remake Poussin according to nature, and to make of impressionism something solid and durable like the art of the museums. His sympathies were all with the later Venetians, Rubens, Poussin, and the baroque masters such as the Caracci and El Greco, whose craftsmanship, bravura and well-organized design he admired. These sympathies found expression throughout his life, but are most evident in his earlier work. In this he used little colour; but under the influence of the impressionists, especially Pissarro, he extended his palette considerably (though still retaining black and the earth colours) and turned to a more intimate study of nature. But for him nature was only a starting-point. Contemplation of her, he held, reinforced by reflection and study of underlying causes, creates in the artist's mind a vision of the structure underlying the external, visible world, which to him becomes a series of organic relations between solid forms, which it is his business to realize on canvas. Cézanne's method was to establish the relations between the planes enclosing an object or group of objects by recording all the subtle differences in their colour due to differences in their relation to the light. But it is the form, not the light around it, which interests Cézanne. He worked slowly and painfully; but such was his desire for keeping every element of his work in correct relation that one alteration would often lead to complete repainting. The legend of Cézanne's technical incompetence is partly due to his constant self-depreciation and to the amount of work he left unfinished in despair or disgust. Though his ultimate rank as a painter is still in the balance, his influence underlies much of modern art.

Georges Seurat (1859-1891), like Cézanne, found in the 16th- and 17th-century masters the inspiration to recreate on canvas a world of three dimensions rather than copy that before his eyes. At the same time modern scientific research into colour led him to develop his well-known neo-impressionist technique, which has rather obscured his power of expressing structure and of welding form into balanced and monumental design. But he has exercised much influence, especially on the cubists, whose studio walls often carried reproductions of "Le Chahut," one of his last pictures.

Henri Rousseau (1844-1910), "le douanier," a very different figure was once an octroi official in Paris (whence his nickname). He is the true type of the primitive who tries to paint things as he knows them to be rather than as they appear. He used, for example, to measure his sitters with a footrule, and transfer these measurements to canvas. His work, which includes portraits, views of the suburbs of Paris, exotic landscapes based on recollections of military service in Mexico, and figure compositions, is marked by emphasis on solidity, precision of handling, adjustment of the relative size of objects according to their importance as elements in design, and at times by a symbolic element.

In contrast to Rousseau is Gustave Moreau (1826-1898), a strange figure bred in the strictest academic tradition, whose romantic spirit borrowed fire from Delacroix and Chassériau, and who fed his imagination upon the myths of Greece and the East. He emerged from many years' retirement to become at the end of his life professor at the École des Beaux Arts, where his influence helped to breed a group of young painters with symbolist tendencies. As a teacher Moreau always encouraged self-expression based on close study of the old masters. In his own work Moreau stood for the use of the plastic arts to express the emotions, and built up a decorative art, combining sombre rich colour and rhythmic linear arabesque.

Paul Gauguin (1848-1903) was more definitely a *chef d'école* than any of the group now under consideration. After an impres-

sionist phase, he became in Brittany the centre of the famous Pont-Aven group, and there developed the theory of synthesis which was to govern all his later work. In 1891 he went to Tahiti and, except for a brief return to France, spent the rest of his life there. Admiration of the primitive was at the base of Gauguin's art. Rejecting impressionism as a mere reproduction of nature not inspired by thought, he held that study of nature awakes emotions in the artist which he has to express by bringing into organized relation symbols, consisting of forms and colours, supplied by nature. Primitive art alone, he considered, proceeds from the spirit, and uses rather than mimics nature; and he justified going to Tahiti on the ground that there only was his imagination sufficiently stirred by nature. Though the colour and forms in his pictures might not actually exist in nature, he claimed them to be the pictorial equivalent of the grandeur, profundity and mystery of Tahiti. His latest work most completely embodies this conception of art in its design based on boldly simplified contours enclosing areas of rich purples, greens, reds and oranges. To the end Gauguin's colour showed impressionist influence. Otherwise his art is primarily decorative, with colours keyed to express the painter's mood, and shows a less passionate search for solidity than Cézanne's. His symbolism, though not primarily literary, towards the end moved somewhat in that direction.

Akin to Gauguin in his outlook and use of colour is Vincent van Gogh (1853-1890). Born in Holland, his early work shows the influence of the Hague School; association with the impressionists in Paris led to his settling down at Arles to the use of heavy masses of vivid colour arranged indefinite patterns, emphasized by black outlines and writhing arabesques of paint. A passionate lover of nature and a mystic and idealist by temperament, Van Gogh believed that the artist's creative power was given to him to make men happy. Vehement personal passion is the note of his work. His colour ultimately became quite non-naturalistic, and was solely directed towards expressing his emotions; and his surface texture was designed to increase the arresting, disquieting quality of his work. The third dimension did not play a dominant part in Van Gogh's work. His design, in which decorative simplification became increasingly marked, shows very strongly the influence of Japanese art.

*Symbolism and Fauvism.*—The characteristic elements of the preceding group of painters—rejection of naturalistic representation, emphasis on solidity and structure, organized design, and the symbolic use of form and colour—are united in varying degrees in the work of their successors. The influence of Cézanne, which has modified or supplanted that of others, took some time to develop, and the first well-marked group to appear was that round Gauguin at Pont Aven. Among these was Paul Sérusier (b.1864), who was one of the first to formulate a doctrine based on the ideas of Gauguin, Cézanne and Odilon Redon. He drew round him a group of *symbolistes* which included Maurice Denis (b.1870), Pierre Bonnard, K-Xavier Roussel and Edouard Vuillard. This doctrine declares that a work of art must aim at the expression of an idea. Since it uses form for this purpose, it must be symbolic; and since the form has to be organized, it must be synthetic and decorative. At the basis of this is a belief in correspondence between external forms and subjective states—not, however, by association but direct. Sérusier and Denis have given these ideas a mystical and religious application, largely under the influence of the *quattrocento* Italians. In Bonnard (b.1867) and Vuillard (b.1867), however, the purely decorative element is uppermost, in a graceful and refined but over-precious treatment of material drawn from everyday life, influenced by Japanese art, and marked by elusive and delicate harmonies of green, blue, rose and yellow combined with grey. Closely akin to this *symboliste* group is another whose best-known members were pupils of Gustave Moreau. The religious symbolic pictures of Georges Desvallières (b.1861) are characterized by the use of arabesque and rich exotic colour; the more realistic art of Charles Guérin (b.1874) by its decorative aim and search for tonal rather than linear unity. The influence of Moreau, modified only by the pupil's own temperament, is well seen in the fantastic, savagely distorted nudes, and mysterious, sombre

landscapes of Georges Rouault. Far better known is his fellow-pupil Henri Matisse (b.1869), who represents the expressionist side of symbolism in its most extreme form. Academic and neo-impressionist phases never obscured his very personal use of line and colour whose decorative quality relates him to the Chinese and Japanese. His arbitrary distortions of the human figure, partly based on the study of negro art, marked a stage towards the abstract, non-representative art of the cubists. These distortions, his apparently anarchic design and his colour earned for Matisse the title of "Chef des Fauves," though he has not formed the centre of a well-marked group, despite his wide influence. It is difficult to acquit him of sometimes painting *pour épater les bourgeois*; but his latest work, while retaining delicacy and sensitiveness, shows increased discipline and restraint. Both in his drawing and painting Matisse is notable for his use of a pure unaccented contour, which nevertheless generates solid form. Somewhat the same power is seen in the Italian painter and sculptor Amédée Modigliani (1884-1920), though he is far more mannered than Matisse and lacks his feeling for colour.

Kees van Dongen (b.1877, in Holland) mingles the influence of Matisse with that of Toulouse-Lautrec, and mainly shows the application of a *fauviste* recipe to the painting of fashionable Parisian society. Different from the *symbolistes* and *fauves*, but equally a reaction against impressionism, are the painters who return to the outlook and methods of the *quattrocento* Italians. Among these are Jean Frélaud (b.1879), notable for his sincere, thoroughly realized interpretations of the country and people round Morbihan in Brittany; and Félix Vallotton (b.1865, at Lausanne), whose angular, precise contours and definite colour pattern relate him to the primitives, and have won him the nickname of the Cabanel of the Salon d'Automne. This Pre-Raphaelite tendency is represented in England by Joseph Southall, head of the Birmingham School of Art, whose work is akin to that of Benozzo Gozzoli; and by Henry Lamb, Stanley Spencer and Gilbert Spencer, who in 1921 were the most prominent of a group of younger men in London of undoubted sincerity but inclined at times to use a rather elementary formula. Their work is also interesting as illustrating a tendency in British art towards decorative design suitable for mural painting. Similar, though more academic in outlook, is Eric Kennington, whose war paintings attracted much attention, their sentimental interest obscuring their mannered draughtsmanship and pretty colour.

*Cubism.*—To all the manifestations of the modern movement so far considered cubism is a marked contrast. It was a reaction not only against impressionism but against fauvism, and stands for the introduction of order and discipline into painting. So much was this the case that some opponents of the movement professed to see therein a return offensive of the academics. It owes its name and in part its origin to Matisse, from whose association with Picasso and others the movement took shape in 1908. This group coalesced with another working on similar lines, and represented by Albert Gleizes and Jean Metzinger, to win cubism its first public victory in the Salon d'Automne of 1913. To the influence of Cézanne and Seurat, which was mainly behind the movement, was joined that of Negro and Polynesian art, in which the cubists found a simplification of the human form emphasizing its bulk and solidity, and a complete disregard of normal appearance in the effort to express a conception. The central point of cubism is its entire rejection of the reproduction of natural appearance, which, cubists hold, merely serves to awaken in the artist emotions which he expresses by a series of abstract forms, ordered and arrayed by his will. Thus cubism aims at creating a kind of visual music. In its most austere form it avoids curved lines and colour as pretty and sentimental; and even holds that a picture is not a decoration since that term implies dependence upon external objects. From the first, great emphasis was laid on the expression of volume and its arrangement in space. This aroused difficulties, which have separated the cubists into distinct groups. The representation of a third dimension introduced an element of resemblance to nature. Some painters accepted this, so that their pictures are little more than arrangements of realistically painted cubes and cylinders: others rebelled against such

a restricted art, and made of cubism merely an exercise and discipline in the expression of three-dimensional form. The purists, however, hold that art is not concerned with Euclidean space but with a special pictorial space, which we feel by our whole personality expanding or contracting before a picture; and that it is not the painter's business to create an illusion of a third dimension but to make live on a two-dimensional surface a reality of three dimensions. Further difficulties have been caused by development of a theory of simultaneity which justifies presentation on the same canvas of several aspects of the same object; this often only comes to a mechanical arrangement of a number of separate impressions, whose disentanglement may be a source of interest, so that cubism is descriptive rather than pictorial.

Pablo Picasso (b.1881, at Malaga) has been the dominating force in the movement, but by no means typifies it. With him cubism has been only a phase. To a realistic period, mainly influenced by Toulouse-Lautrec, succeeded a group of reddish nudes, solidly constructed from simplified planes, which ushered in the cubist period. The earlier work in this showed some conformity to natural appearance, and was mainly in *grisaille*. Later the forms became more abstract, the design more arbitrary and the colour brilliant, sand and similar substances being embedded in the paint to give relief and variety of surface. Picasso's latest phase shows the influence of Ingres, especially in his drawings. Some of these show a delicate, unbroken contour, others the use of shading; but all conform closely to natural appearance, with only enough distortion to give flow and rhythm. The chief characteristic of Picasso is his versatility. There is no method he has tried which he has not mastered. But whether he has yet achieved more than a series of exercises in different manners is open to question. The work of other cubists is remarkable for its sameness and impersonal quality. Georges Braque's rigid adherence to abstract forms, straight lines and sombre browns and greys make him the purist of the movement; Gleizes and Metzinger, by their more graceful use of line and colour and by their writings, are its popularizers; while Fernand Leger and Auguste Herbin are mainly makers of attractive patterns in bright colour. The use of colour is, however, pushed furthest by the Orphists, such as R. Delaunay, whose rejection of all rules is really a protest against the formal side of cubism, which he has translated into terms of curves and circles decked with vivid colour.

Between the extremes of cubism and fauvism stands a considerable group of artists who derive something from both, but represent the direct and increasing influence of Cézanne. Of these Albert Marquet (b.1875) is primarily a painter of Paris and of the Seine, whose use of well-defined planes, with their tonal relations very accurately expressed, is apt to degenerate into an ingenious system of notation. Jean Puy (b.1876), in his landscapes of wide-stretching countrysides, brings many scattered elements into harmonious relation by his feeling for subtle variations in colour and tone. With Othon Friez (b.1879) the organizing constructive instinct is uppermost, but he shows considerable power of retaining fresh and unspoiled his original conception. More consciously decorative than Cézanne, his mural paintings sometimes show the influence of Gauguin. Jean Marchand (b.1883) and Dunoyer de Segonzac (b.1884) represent a younger generation to whom cubism has been a gymnastic to develop understanding of form, but who now rely on colour and tone to give solidity and a sense of space. Marchand, taking for his material the most ordinary objects of daily life and the countryside, and using a simple, sober palette, gives his work distinction by his dignified design; Segonzac, with similar constructive power, works in a thick impasto with free use of the palette-knife in colour which has become increasingly sombre. His war paintings express a very personal emotion awakened by experience, and are the colour of the mud which dominated the battlefield. André Derain (b.1880) is one of the most influential of younger painters who, after a period influenced by Van Gogh and the neo-impressionists, produced a series of truculent nudes and landscapes, which showed cubist and fauve influence in their simplified and distorted forms. His recent work is more sober and severe, and reflects a study of Ingres. At times Derain's technical accomplishment threatens

to lead him into the mannerism which marks the dramatic landscapes of Maurice Vlaminck (b.1876), with their heavy skies and contrast of sombre greens with vivid reds and pinks.

**Futurism.**—Modern art in other countries is mainly an extension or adaptation of French ideas and method. Spain, it is true, has produced Picasso; but cubism is entirely Parisian in origin, and so much of the modern spirit as appears in Catalan painters such as Sunyer and Casals is derived from France. Futurism, however, is indigenous to Italy. The term has been loosely used, especially in England, to denote the modern movement as a whole; but it has a definite and limited application to the doctrines of a group of Italian poets, sculptors and painters, first presented to the world in 1909 in a manifesto signed by F. T. Marinetti, the poet and high priest of the movement. These doctrines apply to art a general philosophy of life, with its origin in modern scientific theories which express all matter in terms of energy, and are based on denunciation of all that the past has done (whence the name futurism) and on the worship of movement and conflict as the dominant characteristics of modern life. Cubism, as based on tradition and dealing only with the static aspects of life, it rejects; impressionism it claims to have surpassed, but takes as a starting-point. The futurist's aim is to represent, not the appearance of objects at some particular point in their course, but the sensation of movement and growth itself. One method, which connects futurism with cubism, is to combine on one canvas not only what the artist sees, but what he knows and remembers about an object. Another, peculiar to futurism, is the use of "force lines." Every object, it is argued, is at a given moment the temporary outcome of continuously acting forces, whose character is indicated by the lines and planes enclosing it. Thus an object becomes simply the beginning or prolongation of rhythms conveyed to the artist by contemplation thereof; and these he represents in his picture by lines arranged to clash, harmonize, or interplay in order to express states of mind such as chaotic excitement, happiness or interest. Colour the futurists use arbitrarily to assist in conveying these sensations.

Luigi Russolo is the most logical and orthodox of the futurists. The work of others, such as Carlo Carrà, is little more than a catalogue of information about a number of different objects; though Umberto Boccioni, who has applied futurist theories also to sculpture, sometimes redeems his work by an interesting design. The gaily coloured, tapestry-like patterns of Gino Severini are among the most attractive futurist paintings; but his recent work has been modified by cubist and academic influences. His career typifies the fate of futurism, which has found no new recruits; and has had but transient influence.

**Modern English Painting.**—The English vorticists share some of the futurist doctrines; but the main forces shaping the modern movement in England are French. This movement first took shape in the studio of Walter Sickert, and resulted in the formation of the Camden Town group under the presidency of Spencer Frederick Gore (1878-1914), which developed into the more eclectic London group, whose first president was Harold Gilman (1876-1919). At the same time Roger Fry (b.1866), by his writings and by assisting to organize post-impressionist exhibitions in 1910 and 1912 at the Grafton Galleries, did much to make known the character of the modern movement in France, and to assimilate more closely thereto the English movement. Gore and Gilman represent the movement in its earlier stages. Gore's earlier impressionism was modified under the influence of Cézanne and Van Gogh by increased attention to structure and design, which for a time obscured his charming sense of colour. This reappeared in his latest and most important work, done mainly at Richmond. Gilman emerged from a period influenced by Whistler and painters of the Vuillard type to one which gave increased emphasis to the third dimension and showed the influence of Van Gogh in the use of brilliant, clear colour and the handling of paint. Charles Ginner, whose work is closely akin to Gilman's, describes their art as aiming at "the plastic interpretation of life through intimate research into nature." The emotions aroused by nature in the artist he must express by deliberate and objective transposition of nature on to canvas, so that he reveals the qualities in her

which have moved him. The variety of line and colour in nature, joined to the artist's personality, will produce a decorative composition. This neo-realism (as Ginner calls it) is based on the attitude of Cézanne and Van Gogh towards nature; but gives an English turn to that attitude by emphasizing the part played by nature as compared with that of the artist. The French point of view is more evident in the work of the London group. Some of its members are still slaves to a French formula; others have been based on French teaching a more individual art, notably W. B. Adeney, F. J. Porter, Roger Fry and Duncan Grant, whose sense of colour gives his art characteristic quality. C. R. W. Nevinson, having explored in turn impressionism, futurism and cubism, subsequently abandoned the geometric convention which marked his war paintings, to reveal the academic art masked by his previous experiments.

**Vorticism.**—Distinct in character is the vorticism movement, with which Nevinson was once associated. This had its origin in 1913 among certain members of the Camden Town group, and had as its leading figures the painters Percy Wyndham Lewis, Cuthbert Hamilton, Frederick Etchells, Edward Wadsworth and William Roberts, the poet Ezra Pound, and the sculptor Henri Gaudier-Brzeska (1891-1915). Like futurism, it holds that modern art must be based on the character of modern industrial civilization, whose features are complexity and dominance of the machine; and since England is preëminently the type of the modern industrial country, this art will be an English art. But it rejects futurism as merely the cinematographic representation of a series of impressions; and joins the modern movement as a whole in basing itself on tradition, and claiming that the artist's work is not to copy nature, but to create new realities. Every phase of emotion has its appropriate means of expression in some particular form of some particular material, whose appeal is direct and not by association or allegory. These forms take shape and proceed out of the artist's "vortex" (hence the name of the movement), which is a general conception of relations in the universe through which ideas pass and take concrete shape, just as the general equation of a circle in analytical geometry becomes one particular circle when definite quantities are substituted for the algebraic symbol. In 1920 the vorticism movement issued in a secession from the London group to form the X group. But though mainly composed of vorticists, its first exhibition showed some modification if not in doctrine, yet in practice. The earlier vorticism work was geometric and abstract, and owed much to cubism. Hamilton still represented this phase in 1921; but others had turned in the direction of expressing the structure and essential character of natural forms in the way exemplified by the work of Wyndham Lewis. Much of the interest of the earlier vorticism painting lies in disentangling in sequence the elements from which it is constructed; and to this extent it is descriptive and literary. Otherwise, though sometimes showing new and interesting combinations of shapes and colours, it presents only a barren world of geometrical forms.

**Modern German Painting.**—In Germany the modern movement has been mainly inspired by that side of modern French art represented by Matisse and Derain. Cubism has not gained a real footing there; though the Russian Jew, Marc Chagall, shows cubist influence in the sharply defined planes and angular design of his fantastic, vividly coloured, decorations; and Lyonel Feininger has adopted the cubist method of extension and development of planes. Arbitrary distortion and writhing arabesque are more congenial means of expression in an art always tending towards the romantic and symbolic; native influences, such as Hans von Marées and the Munich decorative school, joined to the study of El Greco and Matthias Grünewald, have paved the way for an expressionist art in the fullest sense of the term—one which gives vent to every kind of emotion with unrestrained and brutal vehemence. A mystical temper and a mass of confused aspirations induced by the war have stimulated this development; but the movement was in being before the war, chiefly under the leadership of Wassily Kandinsky (b. 1866, at Moscow), a prominent member of a Munich group of painters, poets and musicians, whose aim was the expression through art of the "innerer Klang"

—the *soul* of nature and humanity. According to Kandinsky, colour and form have the power of producing spiritual vibrations quite apart from their ordinary meaning and associations; and a picture consists of an arrangement of form and colour whose spiritual values are in harmony, and unite to express the artist's spiritual conceptions. Thus painting ceases to have representation as its purpose, and becomes analogous to music in its rhythmic arrangements of forms and colours. These may be borrowed from nature, but must have no external associations and may be freely adapted and distorted to suit the artist's aim. Thus Kandinsky has points of contact both with the *symbolistes* and cubists; but he criticizes the latter for reducing the construction of a picture to rules and formulas, and for paying over-much attention merely to representing three-dimensional form. Kandinsky's own work has become increasingly abstract in character and consists of some early flat decorations, combining Russian and Munich influences; a group of more or less direct impressions of nature, inspired by Matisse; "improvisations" which represent spontaneous expressions of inner character; and "compositions" which express a slowly formed and mature spiritual feeling. His most important disciple is Franz Marc (1880-1916), whose animal compositions boldly designed in arbitrary colour are his most typical work. Less abstract but more brutal is a group which has come into special prominence during and after the war. Most prominent of these is Oskar Kokoschka (b. 1886, in Austria), whose early work showed the free distortion, sharp contrasts of light and shade, bold contours, and thick impasto worked into arabesques, by which he conveys his excited and very personal vision. In his later work emphasis by these means is even more emphatic and merciless. The heads of his figures are balanced on tiny bodies, bizarre monsters are introduced, and the paint is literally thrown on the canvas, with great channels made therein to mark the dominant lines of the design. Painters of similar tendencies are Emil Nolde, Karl Hofer, and Karl Schmidt-Rottluff. The last, under the influence of negro sculpture, has become a coarser Matisse. The influence of an earlier generation of Frenchmen is seen in Max Pechstein, whose work owes much to Gauguin, and in Albert Werszgerber and Carl Caspar, both of whom base their design and use of colour on Cézanne. Edward Munch (b. 1862, in Norway) stands somewhat apart in his combination of realism, fantasy and power of monumental design derived from Manet, Toulouse-Lautrec and Seurat, which excited violent controversy in Berlin when first exhibited, and led to the split in the Kunstverein there which marks the rise of the modern movement.

**Modern Russian Painting.**—In Russia the influence of French art has been no less marked than elsewhere, but has taken peculiar and characteristic shape. Towards the end of the 19th century Western and in particular French influence was represented by the realistic historical painters such as Ilya and Repin and a group of *plein-air* landscape painters. In reaction against their naturalism a decorative school developed, corresponding somewhat to the English Pre-Raphaelites, basing its work on old Russian art, and represented by Vassily Surikov (1848-1916) and Victor Vasnetsov. Of this reaction the modern movement is really a development. One form it has taken is represented by Mikhail Vrubel (d. 1910), whose mystical symbolism recalls that of Gustave Moreau in its search to express things of the spirit in pictorial form; while Petroff-Wodkin is nearer to the French fauves in his simplified and distorted nudes and arbitrary use of colour. More important is a Petrograd group, consisting of historical painters whose aim is to reconstruct in decorative form a past epoch, not from living models dressed in costume of the period, but from the close study of every form of contemporary record. Thus, the movement is primarily intellectual and literary and has produced an art which, for all its refinement and delicacy, is inclined to be precious and a mere *réchauffé* of already-used material. Within the movement one group looks to the West. Alexander Benois has concentrated on the age of Louis XIV.; Konstantine Somov, the most charming and individual of all, upon the period of 1830; and Eugène Lanceray upon the court of Elizabeth and Peter the Great. Stelletsky and Count Koma

rovsky, on the other hand, have gone to old Russia for their motives. Stelletsky is the purist of the group, his reconstructions of Russian mediaeval life being based upon minute archaeological study of ikons, service books and similar sources. Nicolas Roerich has departed from strictly documentary methods in seeking to reconstruct primeval and prehistoric Russia in his fantastic flat decorations based on Russian legends, and thereby joins hands with the group represented by Vasnetsov. Rather apart is Boris Anrep (working in 1921 in England), who studied Byzantine art and the ikon, not in an archaeological spirit, but as exemplifying a means for the expression of human emotion. His work is principally in mosaic, submission to whose limitations, he holds, makes for the simplicity and directness which are often lost amid the technical possibilities of oil paint. The close connexion of modern Russian art with the theatre is another important characteristic, which has grown directly out of the decorative reaction against realism. Leon Bakst represents one side of this. Originally associated with the Petrograd historical group, he came into touch with Serge Diaghilev and became one of the chief designers of settings for the Russian Ballet. His use of line and colour relates him to the East; but, like Benois and Somov, his outlook and method are those of the West. Distinct in character is the art of Nathali Gontcharova and M. Larionov. Using the methods of the Petrograd group, they took their material from Russian peasant art, as represented in the decoration of articles in daily use and in the "lubok," the Russian equivalent of the "images d'Épinal," which gives their earlier work notable simplicity and directness. The West was not to be denied, however, and Gontcharova's setting for the 1914 production of the "Coq d'Or" and Larionov's "Les Contes Russes" of 1915 mark the invasion of the theatre by cubist ideas. The colour scheme was still that of Russian peasant art; but the design was based on abstract forms, and aimed at a rhythm in harmony with the music and the dances. To this development the name of *rayonnisme* has been given.

Much of the criticism levelled at the modern movement, like that once directed against impressionism, is merely a violent statement of personal preference. Weightier arguments point out that the emphasis given in the modern movement to the third dimension merely exalts one element in natural appearance, and urge that ultimately design must be based on the play of contour and shapes on the picture plane. Also, it is said, modern methods of simplification and distortion tend to become formulas which prevent sincere and spontaneous expression no less than older conventions. But contention chiefly centres round the question of representation. It is argued that a purely abstract art, which takes no account of the ideas and emotions conveyed by the objects represented, is a limited and empty affair. Rhythm in the plastic arts, no less than in literature, must emphasize some meaning; and form takes on a significance by association, if not with specific objects, yet with general ideas of mass, space and movement.

UNITED STATES.—Between 1910 and 1921 many of the painters mentioned in the earlier article (20.518) had passed away, and some of their younger contemporaries had also laid down their brushes: Ryder, Bunce, Blakelock, Duveneck, Alexander, Smedley, Millet, Cox, Beckwith, Alden Weir. Abbey, who died in 1911, left no followers, but La Farge and Chase wielded great influence over a host of pupils. With the development of American art-schools and the increasing number of capable instructors, the trend towards European art-centres had by 1921 grown less. There was already promise of a school with distinctly American characteristics. This was to be seen most clearly among the painters of landscape. Twachtman and Robinson, among the older men who were trained abroad, brought back some of the light of

the so-called Impressionist School, and their example in raising the colour-pitch was of great benefit. Crane, a pupil of Wyant, and such men as Tryon, Murphy and Ben Foster, ably carried on the tradition they received from their American masters. Dewing, Metcalf and Childe Hassam developed individual ways of looking at their subjects. Carlsen, Dougherty and Waugh found the sea an ever-changing theme for their brushes, and they produced canvases not behind those of the landscape men.

With the passing of the Society of American Artists, the men who made this organization a force were merged with the members of the older National Academy and became conservatives in their turn. Thayer, Brush, Blashfield, Tarbell, Mowbray, Melchers and Simmons were still in 1920 painting pictures which showed their sound technical training and their artistic point of view. Some of the later men who developed original ways of doing things were Robert Henri, Jonas Lie, William Glackens, Rockwell Kent, John Sloane, George B. Luks, C. C. Cooper, A. B. Davies, Jerome Myers, George Bellows, Gardner Symons, Everett Shinn, W. E. Schofield and Randall Davey. Abundant manifestations of vorticism and cubism came to be seen in American painting. The followers of Cézanne, Matisse, Gauguin, Van Gogh and Picasso were many, but chiefly the younger men whose work was still in the experimental stage. There was a steady advance in mural painting. Sargent added to the decorations for the Boston Public Library, and the example set there and elsewhere was followed in many of the larger cities, in state capitols, municipal courts, churches and theatres. Pittsburgh, Harrisburg, Baltimore, St. Paul and Minneapolis have important buildings decorated by such mural painters as La Farge, Blashfield, Alexander, and others. There has been remarkable growth at the art museums, especially at the Metropolitan Museum of New York, the Boston Museum of Fine Arts, the Carnegie Institute of Pittsburgh (whose international exhibitions draw many exhibits from overseas), and the Chicago Art Institute. No less remarkable has been the formation of important collections in cities whose size would often afford no reason for expecting their presence. Worcester, Providence, Cleveland and Minneapolis have excellent museums. Washington now possesses three collections of paintings—the Corcoran Gallery, the National Gallery and the Freer Collection. Moreover, private collections of importance have increased in number and quality, and native artists are often given there the high place they deserve. Some of the universities offer courses in the History of Art and in the elements of design. In time this should produce a body of intelligent criticism which should still further stimulate artistic effort in America. (J. C. VAN D.)

**PALAEONTOLOGY** (see 20.579).—During the period 1910-21 the science of extinct forms of life made remarkable progress, especially in North America, where explorations and studies were less interrupted by the World War. The contact of palaeontology with other sciences—even those apparently remote like astronomy, physics and chemistry, less remote like comparative anatomy, or very intimate like geology—was one of the outstanding features of the synthetic work accomplished. Of transcendent interest, however, was the contact between mammalian palaeontology and anthropology, especially through the researches of William K. Gregory of the American Museum of Natural History, and also of G. Elliot Smith of London University to whom is due the article on ANTHROPOLOGY in these New Volumes.

*Principal Synthetic Works of 1910-21.*—Chief among the synthetic works in pure palaeontology are those of the Austrian palaeontologist Othenio Abel, *Grundzüge der Paläobiologie der Wirbeltiere* (1912), *Die Stämme der Wirbeltiere* (1919), and *Lehrbuch der Paläozoologie* (1920), which give masterly reviews of the whole fossil history of the vertebrates, especially in analogous and convergent adaptation. In invertebrate palaeontology the reader is referred to Amadeus Grabau's *Principles of Stratigraphy* (1913) and *Textbook of Geology* (1920-1), in which are summed up the principles derived from the teachings of Waagen and Neumayr in Germany, of Hyatt and Beecher in America, in pure palaeontology and in application to geology. A broad synthetic treatment of climate and time in relation to the evolution of life is that of the late Joseph Barrell (1917) in his *Rhythms and the Measurements of Geologic Time*. The best

synthetic treatment of climate, time and geologic change in relation to the geologic origin and the migration of the different vertebrate groups is William Diller Matthew's *Climale and Evolution* (1915). The subdivisions of geologic time and the successions of faunas and climates are broadly reviewed in the *Textbook of Geology* by Louis V. Pirsson and Charles Schuchert (1915; revised edition, vol. I, 1921). The latest summary of the geology, past physiography and palaeontology of the world is found in the French edition of the great work of Eduard Suess, *Das Antlitz der Erde*, translated and annotated by Emmanuel de Margerie as *La Face de la Terre* (1902, 1918). The comparative evolution of the mammalia of the eastern hemisphere and of North America is broadly treated in Henry Fairfield Osborn's *Age of Mammals* (1910); while the mammals of North and South America are compared in W. B. Scott's *History of Land Mammals in the Western Hemisphere* (1913). A broad treatment of the whole subject of invertebrate and vertebrate evolution is given in Richard S. Lull's *Organic Evolution* (1917) and a synthetic review of the earth's history, from its solar beginnings to the Age of Man, in Osborn's *Origin and Evolution of Life*.

*Life Epochs of Geologic Time*.—The time scale in the accompanying table is taken from the work of Pirsson and Schuchert of 1915, modified by the substitution of geologic time units for years. There is a growing indisposition to reckon past time in terms of years, and a growing tendency to substitute a relative term like *time units*, because of the enormously wide discrepancy between the older estimates of geologists, based on sedimentation and the thickness of the various assemblages of rocks, which, taken together, make up the whole geologic time scale, and the estimates of physicists, based on the slow liberation of radium from radioactive minerals. The radium estimates of the age of the earth range as high as 1,400,000,000 years for the oldest known rocks, according to Barrell, who has adopted the calculations of Rutherford and others based on the "rate of disintegration" of radioactive minerals. The contrast between the two methods is exemplified in the following table:

	Walcott (1893) Years	Barrell (1917) Years
Age of Man and of Mammals—Cenozoic	3,000,000	55,000,000—65,000,000
Age of Reptiles—Mesozoic	9,000,000	140,000,000—180,000,000
Age of Amphibians, Fishes, Invertebrates—Palaeozoic	15,000,000	360,000,000—540,000,000
Precambrian Time—Evolution of Invertebrates and of Unicellular Life	30,000,000	600,000,000—800,000,000
Minimum Total	90,000,000 (Geikie, 1899)	1,200,000,000
Maximum Total	400,000,000 (Geikie, 1899)	1,400,000,000

The most original part of Barrell's contribution was the measurement of time from the base of the Palaeozoic to Recent time by new palaeogeographic methods, taking into account particularly the rhythms or cycles of dry and moist climates and of elevations and depressions, theories which were originally interpreted by T. C. Chamberlin and popularly treated by Ellsworth Huntington, the physiographer of Yale University.

A few decades ago the physicists and mathematicians, especially Kelvin and Tait, insisted that the earth could not be more than 10,000,000 to 20,000,000 years old; now the physicists are extending the age of the life period to 1,400,000,000 years, as estimated by Barrell (1917). The most recent determination by physicists, as reviewed by Lord Rayleigh (1921), takes into consideration the transmutation of chemical elements, for example, in the bröggerite of the Precambrian rocks at Moss, Norway: "Taking the lead as all produced by uranium at the rate above given, we get an age of 925 million years. Some minerals from other archæan rocks in Norway give a rather longer age. . . The helium method is applicable in some cases to materials found in the younger formations, and proves that the ages even of these are to be reckoned in millions of years. Thus the helium in an Eocene iron ore indicated 30,000,000 years at least. . . The upshot is that radioactive methods of research indicate a moderate multiple of 1,000 million years as the duration of the earth's crust as suitable for the habitation of living beings, and that no other considerations from the side of pure physics or astronomy afford any definite presumption against this estimate." Applying this estimate to the evolution of a familiar mammal like the horse, it might be said that the four-toed horse (*Eohippus*) existed 30,000,000 years ago, a somewhat larger estimate of the life period of the horse than that demanded

by palaeontologists. In the same discussion W. J. Sollas comments on the expansion of time estimates proposed by physicists: "The age of the earth was thus increased from a mere score of millions to a thousand millions and more, and the geologist who had before been bankrupt in time now found himself suddenly transformed into a capitalist with more millions in the bank than he knew how to dispose of."

In this connexion we may recall the fact that as early as 1850 Charles Darwin pointed out that the high degree of evolution and specialization seen in the invertebrate fossils at the base of the Palaeozoic, namely, the Cambrian, proved that Precambrian evolution occupied a period as long as, or even longer than, that of Cambrian to Recent time (see Table I on p. 11). Poulton, the leading disciple of Darwin in England (1896), declared that 400,000,000 years was none too long for the whole life evolution period; this would allow 200,000,000 years for Precambrian time and another 200,000,000 years from Cambrian to Recent time.

*Walcott's Revelation of Precambrian and Cambrian Life*.—Charles D. Walcott (1899, 1914) has discovered the remains of life in the Precambrian (Proterozoic) rocks of North America and has been able to give us a fragmentary picture of the fauna and flora of that very ancient period. In Montana at a depth of nearly 10,000 ft. below the earliest Palaeozoic rocks (Cambrian) he found evidence of ancient reef deposits of calcareous algae, which ranged upward through 2,000 ft. of strata. Above these reefs are 3,000 ft. of shales containing worm trails and the fragmentary remains of large crustacean-like organisms. From rocks of approximately the same age in Ontario, Canada, he has described sponge-like forms (*Allokonia*) which are of such generalized structure that it is difficult to decide whether they should be regarded as sponges or as archæa corals. These few plant and animal remains are all that are known from remotely metamor-

phosed rocks of Precambrian time, but the existence of annelids and possible arthropods marks a break into the hitherto unknown Precambrian. Walcott's most surprising discovery in Precambrian time is a monad or bacterium attributed to *Micrococcus* sp. indet. from the Algonkian of Montana, but probably related rather to the existing *Nitrosomonas*, one of the prototrophic or primitive-feeding bacteria, which derives its nitrogen from ammonium salts.

In 1920 Walcott discovered in the Cambrian (Burgess) shales of Alberta, Canada, a marvellously rich fauna whose preservation is so perfect that the setae of the worms, the jointed appendages of the trilobites, the impressions of soft-bodied medusæ and holothurians, and even the alimentary tract and stomach of certain of the crustaceans can be seen on the shale surfaces almost as clearly as in living forms (Plate I.). This discovery fairly revolutionizes our knowledge of the anatomy of the delicately organized as well as the chitinous-armoured forms, like the trilobites. Including the new forms contained within these Albertan shales, the Cambrian marine fauna is now known to be far more abundant than even imagined by Darwin, comprising some 1,500 species, 1,200 of which occur in North America. From Lower as well as Middle Cambrian (Burgess) faunas, it appears that the Precambrian invertebrates had probably become completely adapted to all the life zones of the continental and oceanic waters, excepting possibly the abyssal. All the principal phyla—the jointed arthropoda (including the trilobites among the crustaceans and the merostomes among the arachnids), segmented worms (Annelida), echinoderms, molluscs (including pelecypods, gastropods and primitive cephalopods), brachiopods, medusæ and other coelenterates, and sponges—were presumably established in Precambrian times.

TABLE I. Life Epochs and Geologic Time Units of Europe and North America (After Pirsson and Schuchert, 1915; Issued by Osborn in 1918)

The Cambrian fauna has been made known to us in large measure through the field discoveries and monographic studies of Philip Lake (1906) for Great Britain, of Walcott (1909-21) for North America, and of Cowper Reed (1915) for India. The great variety and high specialization of the Cambrian marine forms, including representatives of all the known marine invertebrate phyla, is in harmony with the trend of discovery among the vertebrates, which is to put the origin of existing families very far back into the Age of Mammals and even into the Age of Reptiles (Mesozoic). In fact, the antiquity and persistence of modern types, as distinguished from modern genera and species, is an illustration of a very far-reaching principle, namely, that the most stable form of energy in matter known is that of the hereditary chromatin on which this extraordinary preservation of the main features of the ancestral type depends. Next to the stability of the properties of the chemical elements, which are now known to pass into each other by transmutation, the most stable physicochemical properties are those which form the hereditary basis of life.

*Freshwater and Terrestrial Origins.*—The eurypterids appear as contemporaries of the Cambrian trilobites and traces of them are found in Precambrian rocks; they attain to their acme in Silurian time and develop into the eight-foot giants of the fauna of the Devonian of Scotland and eastern North America, suffering extinction at the close of the Palaeozoic. In 1916 appeared Marjorie O'Connell's memoir, entitled *The Habitat of the Eurypterida*, giving as the summation of her studies that throughout their entire phylogenetic history the eurypterids lived in the rivers, a conclusion accepted in the main by Schuchert (1916), with the modification that they also appeared to have lived at times in the brackish waters of more or less large bays and possibly in limited numbers even in the seas. Many other origins formerly traced to the sea have more recently been traced to fresh water. T. C. Chamberlin (1900) proposed the hypothesis of a prevailing freshwater origin both for the ancestral backboned animals known as chordates as well as for the much more ancient arthropods, the eurypterids. His strong influence was needed to overcome the widespread notion that all forms of life originated in the sea; and, one after another, theories of freshwater and terrestrial origin have replaced the theory of marine origin. Early in 1916 Barrell pointed out the influence of Silurian-Devonian climates on the rise of air-breathing vertebrates and freshwater origin in Devonian time under seasonal rainfall.

Schuchert continues that the probable freshwater life of the eurypterids opens a vista into continental life as far back as the Upper Cambrian. Other merostomes related to the eurypterids radiated out from the fluvial faunas of Cambrian, Ordovician and Silurian time, while in the Devonian rivers dwelt great spider-like eurypterids together with forms so similar to scorpions that they might be called river scorpions, and others that were active swimmers. O'Connell's argument regarding the freshwater eurypterids applies equally to *Limulus*, the horse-shoe crab. In brief, the existence of freshwater faunas no less varied than the marine faunas is beginning to be traced back to Lower Cambrian time. O'Connell shows that the entire phylogeny of the eurypterids, which includes about 160 species from the Precambrian to the end of the Palaeozoic, distributed in 78 geologic horizons throughout the world, points to migrations like those of fishes from the headwaters of interlacing river systems, and, taken with other evidence, strongly supports the theory of Predevonian river life as opposed to the general assumption of marine life of all early faunas.

It now appears that beginning in Precambrian time the trilobites, by wide adaptive radiation, reached the acme of their development in the Cambrian, displaying a high degree of articulation and specialization of appendages, suffered a marked decline after the Silurian, and became extinct at the end of the Palaeozoic. James Perrin Smith, who has made a very exhaustive analysis of cephalopod evolution and especially of the Triassic ammonites, observes that the evolution of form continues uninterruptedly even where there is no evidence whatever of environmental change.

*Principal Literature, Cambrian to Pleistocene.*—A few of the major contributions to our knowledge of the life of the Palaeozoic are: *Cambrian Geology and Palaeontology* (1910) and *Cambrian Brachiopoda* (1912) by Charles D. Walcott; *Cambrian Fossils of Spiti* (1915) and other papers on the Palaeozoic of India by Cowper Reed; *A Monograph of British Cambrian Trilobites* (1906) by Philip Lake, and *A Monograph of British Graptolites* (1901) by Gertrude Elles and Ethel Wood. The foraminifera have been treated by E. Schell-wien, *Monographie der Fusulinen* (1908-12); the bryozoa by R. S. Bassler, *Early Palaeozoic Bryozoa of the Baltic Provinces* (1911) and G. W. Lee, *British Carboniferous Trepostomata* (1912); the echinoderms by R. T. Jackson in his memoir on the *Phylogeny of the Echini with a Revision of Palaeozoic Species* (1912), and by Frank Springer in his monograph *Crinoidea Flexibilia* (1920) and in numerous shorter contributions. The ancient arthropods, including, besides the trilobites, merostomes and other arachnids and also insects, have been described by J. M. Clarke and R. Ruedemann in their memoir on *The Eurypterida of New York* (1912), by Alexander Petrunkevitch, *A Monograph of the Terrestrial Palaeozoic Arachnida of North America* (1913), by R. I. Pocock, *A Monograph of the Terrestrial Carboniferous Arachnida of Great Britain* (1911), and by F. Meunier, *Nouvelles recherches sur quelques insectes du terrain houiller de Commeny (Allier)* (1906-12). The literature on the Mesozoic contains more references to ammonites than to other groups, because of their abundance and palaeontological importance. The ammonite faunas of the Tertiary have been described by James P. Smith, *The Middle Tertiary Marine Invertebrate Faunas of North America* (1914) and by Carl Diener, *The Trias of the Himalayas* (1912), *Japanische Triasfaunen* (1915), and other papers on the Triassic of the Himalayas and southern Europe (1915).

For the Jurassic there are the classic volumes by S. S. Buckman, *Yorkshire Type Ammonites* (1909-19) continued in the *Type Ammonites* (1920) and the memoir by C. Burckhardt, *Faunes Jurassiques et Crétaciques de San Pedro del Gallo* (1912) for Mexico. The studies on Cretaceous ammonites have been more local in character and include: E. Stolley's *Beiträge zur Kenntniss der Cephalopoden der norddeutschen unteren Kreide* (1911-2), D. N. Sokolov's *Zur Ammoniten Fauna des Petchorischen Jura* (Russian) (1912), H. Yabe and S. Shimizu's, *Notes on Some Cretaceous Ammonites from Japan and California* (1921), and numerous papers by A. de Grossouvre, W. Kilian and E. Haug for France and the Mediterranean region. The silicious sponges which are so well represented in the Mesozoic have received the most careful microscopic study by the students and followers of Zittel. Pioneer work was done in England by the late George Jennings Hinde, *A Monograph of the British Fossil Sponges* (1887-1912), and this work was followed in Germany by A. Schrammen's *Kieselpongien der oberen Kreide von Nordwestdeutschland* (1910) and R. Kolb's *Die Kieselpongien des schwäbischen weissen Jura* (1911). Special works on other groups are: *A Monograph of the Cretaceous Lamellibranchia of England* (1899-1912) by Henry Woods, *Synopsis des Spirobranches (Brachiopodes) Jurassiques Celo-Souabes* (1915-9) by the Swiss palaeontologist Louis Rollier, and Clarke and Twitchell's *The Mesozoic and Cenozoic Echinodermata of the United States* (1915). Among the major contributions to Mesozoic stratigraphy and entire faunas or florae may be mentioned: Victor Uhlig's *The Fauna of the Spiti Shales* (1903), Carl Renz's *Die mesozoischen Faunen Griechenlands* (1911), G. R. Wieland's *American Fossil Cycads* (1906-16), and E. W. Berry's *The Upper Cretaceous Floras of the World* (1916).

For the Tertiary life especial reference should be made to the contributions on different groups made by Thomas Wayland Vaughan (corals), E. W. Berry (plants), J. A. Cushman (foraminifera), R. T. Jackson (echinoderms), Mary Rathbun (crustaceans), A. Pilsbry (cirripedia), and others in *Contributions to the Geology and Palaeontology of the Canal Zone, Panama, and Geologically Related Areas in Central America and the West Indies* (1919). The bryozoa have been carefully described and beautifully illustrated by Ferdinand Canu and Ray S. Bassler, *North American Early Tertiary Bryozoa* (1920), while the foraminifera have been described in equal detail by Joseph A. Cushman in numerous contributions, and by H. Yabe (1921) and H. Douvillé (1911). For other groups we may note: J. Lambert's *Description des Echinides des terrains néogènes du bassin du Rhône* (1911-6), F. W. Harmer's *The Pliocene Mollusca* (1914-20), and papers by W. H. Dall on the mollusca. A general résumé of the Pleistocene vertebrate and invertebrate life is embodied in F. C. Baker's *The Life of the Pleistocene or Glacial Period* (1920). Stimulating general reviews of the progress of invertebrate palaeontology are the presidential addresses by F. A. Bauer, *Fossils and Life*, British Association (1920), by Ruedemann, *The Palaeontology of Arrested Evolution* (1916), and by Clarke, *The Philosophy of Geology and the Order of the State* (1917).

#### PROGRESS IN VERTEBRATE PALAEONTOLOGY

*Personnel: Advent of the Fourth Generation.*—The principal feature of the decade has been the advent of a new generation of explorers and workers in vertebrate palaeontology who, in a sense, constitute a fourth or "20th century" group. Beginning with Cuvier (1769-1832) as founder of the science and leader

of the first group, the second group embraced the British anatomists Richard Owen (1804-1892) and Thomas Henry Huxley (1825-1895), the French leader Albert Gaudry (1827-1908), the Swiss palaeontologist Ludwig Rüttimeyer (1825-1895), and the three great Americans, namely, Joseph Leidy (1823-1891), Edward Drinker Cope (1840-1897), and Othniel C. Marsh (1831-1899). These men marshalled the first positive proofs of vertebrate evolution in Europe and America; they worked more or less independently as pioneers and laid the entire foundation of the modern classification of the Vertebrata. The leader of the third group was the Russian, Waldemar Kovalevsky (1842-1883), who instituted intensive investigation of mechanical adaptation in relation to natural selection. Still productive members of the same period are Arthur Smith Woodward (b. 1864) and Charles W. Andrews (b. 1866) in England, Marcellin Boule (b. 1861) and Charles Depéret (b. 1854) in France, Louis Dollo (b. 1857) in Belgium, Max Schlosser in Germany, Giovanni Capellini (1833- ) in Italy, and in America William B. Scott (b. 1858) and Henry Fairfield Osborn (b. 1857). This group includes also Samuel Wendell Williston recently deceased (1852-1918), and Ramsay H. Traquair (1840-1912). Scott treated chiefly mammals, Williston chiefly reptiles and amphibians, Osborn both mammals and reptiles. The principal accomplishment of this third school has been (1) to conduct world-wide exploration, (2) to correct, coordinate and firmly establish the great classifications proposed by the second school and (3) to fill out the details and principles of phylogeny or lines of reptilian, avian and mammalian descent. The leading explorer of this period was John Bell Hatcher (1861-1904), who brought together a large part of the materials for two great monographs of the United States Geological Survey, Osborn's *Titanotheres* and the Hatcher-Lull *Ceratopsia*; he also made the wonderful collection of South American fossils which forms the basis of Scott's monumental memoirs of the Princeton University Expeditions to Patagonia during the years 1896-9. Osborn's monograph *The Titanotheres* (an Eocene-Oligocene family of mammals), twenty-one years in preparation, has been completed but not published; others of his memoirs are the *Equidae of the Oligocene, Miocene, and Pliocene of North America* (1918) and *Camarasaurus, Amphicoelias, and other Sauropods of Cope* (1921). Williston's monographs are chiefly on the Cretaceous mosasaurs and the archaic Reptilia of the Perm-Trias, to which he made most notable contributions. Of this period were Florentino Ameghino (1854-1911), the distinguished vertebrate palaeontologist of Argentina, and Eberhard Fraas (1862-1915) of Stuttgart. Oliver P. Hay (b. 1846) is also of this group, author of the monograph of the *Fossil Turtles of North America* (1908) and of the invaluable *Bibliography and Catalogue of the Fossil Vertebrata of North America* (1902).

To the fourth group of vertebrate palaeontologists belongs the school trained by Professor Osborn in the American Museum of Natural History, of which the senior is William Diller Matthew (b. 1871), Walter Granger (b. 1872), Barnum Brown (b. 1873), William K. Gregory (b. 1876), Richard S. Lull (b. 1867), of Yale University, Lawrence M. Lambe (1863-1919), late of the Canadian Survey, and C. Forster-Cooper, Cambridge University. The chief intensive work of Matthew and Granger has been on the American Eocene mammalian faunas and in aiding Osborn to establish sixteen Eocene-Oligocene life zones of North America very closely coordinated with corresponding life zones of western Europe. Brown's explorations have added greatly to our knowledge of Cretaceous dinosaurs. Of the same group are the pupils of Williston, of whom the leader is Ermine C. Case (b. 1871), who has contributed treatises on Permian life. At the same time John C. Merriam (b. 1869) has led explorations on the Pacific coast of America and inspired a school of younger workers both in vertebrate and invertebrate palaeontology. In Great Britain D. M. S. Watson (b. 1886) has taken up the work of Owen and Huxley in primary groups of fishes, amphibians and reptiles; in Austria Othenio Abel, a pupil of Dollo, is the great exponent of vertebrate evolution; in Germany Friedrich von Huene and Ferdinand Broili are leaders in sauropsidan palaeontology, other notable palaeontologists of recent years being Franz Dre-

Middle-Cambrian invertebrate fossils, showing the diversity of the animal life of that period and the similarity of many of the types to recent forms. The specimens from which the photographs were taken are in the U.S. National Museum. (Illustrations reproduced by permission of the Secretary of the Smithsonian Institution, Washington, D.C.)

FIG. 1.—*Chioia carteri* Walcott, a silicious sponge.

FIG. 2.—*Ottoia prolifica* Walcott, a gephyrean annelid.

FIG. 3.—*Ottoia minor* Walcott, another gephyrean annelid.

FIG. 4.—*Aysheaia pedunculata* Walcott, a *Tomopteris* like annelid.

FIG. 5.—*Canadia spinosa* Walcott, a polychaete annelid.

FIG. 6.—*Amiskwia sagittiformis* Walcott, a chaetognath.

FIG. 7.—*Waptia fie'densis* Walcott, a *Mysis*-like crustacean.

FIG. 8.—*Opabinia regalis* Walcott, a *Branchipus*-like crustacean.

FIG. 9.—Another specimen of *Opabinia regalis* Walcott.

FIG. 10.—*Burgessia bella* Walcott, an *Apus*-like crustacean.

FIG. 11.—*Marrella splendens* Walcott, a simple trilobite.

FIG. 12.—*Naraoia compacta* Walcott, a curious crustacean.

Notable vertebrate fossils, complete remains of which have been discovered during the last decade. The mounts from which the photographs were taken are in the American Museum of Natural History, New York. (Illustrations reproduced by permission of the President of the American Museum of Natural History.)

FIG. 1.—*Deinodon* or *Gorgosaurus*, a mid-Cretaceous carnivorous dinosaur from Alberta, Canada, mounted in running position.

FIG. 2, 2a.—*Struthiomimus*, the "ostrich mimic," a mid-Cretaceous browsing dinosaur, from Alberta, Canada, a toothless offshoot from the carnivorous dinosaur stock. Fig. 2 shows the com-

plete skeleton in *rigor mortis*, while fig. 2a represents the same, skeleton partly restored from fig. 2.

FIG. 3.—*Diatryma*, a gigantic mollusc-eating bird, from the Lower Eocene of Wyoming.

FIG. 4.—*Moropus*, an okapi-like herbivore, from the Lower Miocene of Dakota, related to the chalicotheres of Europe and Asia.

FIG. 5.—*Pliohippus*, direct one-toed ancestor of the modern horse, from the Lower Pliocene of Nebraska.

FIG. 6.—*Trilophodon*, direct descendant of *Mastodon angustidens* of Europe and North Africa, Lower Pliocene of northern Texas.

All the figures are on the same scale.

vermann, Ernst Strömer (b. 1871) and Otto Jaekel (b. 1863). At Upsala in Sweden Carl Wiman has inspired a remarkably progressive group of workers, while in Switzerland Hans Georg Stehlin (b. 1870) has continued in the great field of Rüttimeyer.

For the principal contributions by palaeontologists of the third and fourth groups above described, the reader is referred to the Memoirs and Bulletins of the American Museum of Natural History, of the university of California, of the Carnegie Institution of Washington, to the Contributions from the Palaeontological Laboratory (Peabody Museum) of Yale University, to the Memoirs and Catalogues of the British Museum (Natural History), to the Palaeontographica, and to the Memoirs of the Société Paléontologique Suisse. It is upon the researches of these workers in field and laboratory that the great synthetic volumes referred to earlier are chiefly founded, and that the following generalizations of modern vertebrate palaeontology are chiefly due.

#### ORIGINS OF THE GREAT VERTEBRATE STOCK AND ITS BRANCHES

*Origin of Chordates.*—No discovery has thus far lessened the gap between the modern Protochordates (*Amphioxus*, tunicates, etc.) and any of the known phyla of invertebrates. Some of the cephalaspid ostracoderms have been cited by Patten as favouring the view that the chordates have been derived from certain arthropods, but such resemblances are ascribed to convergence by Dollo and many others. The earliest ostracoderm remnant actually known is a dermal plate of a genus named *Astraspis* from the Upper Ordovician near Canyon City, Colorado; this represents a new family Astraspidae allied to the Psammosteidae of the Silurian and Devonian (C. R. Eastman, 1917). These chordates, heavily shielded and hence known as *ostracoderms*, were dominant in the Upper Silurian, radiating into six families and many genera, abundant in the Lower Devonian, diminishing in the Middle Devonian and becoming extinct in the Upper Devonian.

*Origin of Fishes.*—The earliest fish remnant actually known is the fin-spined *Onchus* from the Upper Silurian of Scotland, which appears to represent the group of acanthodian sharks, covered with fine quadrate scales like those of ganoids and with a skull structure distinctly elasmobranch. The elasmobranchs (shark and ray types) are still the oldest known gnathostomes or true jaw-bearing vertebrates, constituting (a) one of the four primary gnathostome groups, i.e. jawed groups, the others being (b) the fringe-finned ganoids (Crossopterygii), (c) the ray-finned ganoids and teleosts collectively known as Actinopterygii and (d) the lungfishes (Dipnoi). The fossil ancestors of the fringe-finned ganoids have not yet been discovered; so these animals are theoretically traced to unknown cartilaginous fishes of Silurian times. The oldest Crossopterygian actually known is the *Osteolepis macrolepidotus* of the Middle Old Red Sandstone of Scotland. There were two principal periods of adaptive radiation among the Crossopterygii, the first in Middle and Upper Devonian times, the second in Mesozoic times which produced the family Coelacanthidae, from which may have sprung the existing fishes *Polypterus* and *Calamoidichthys* as degenerate offshoots. From the earlier Devonian radiation of the Crossopterygians is traced the theoretic origin of the Dipnoi or lungfishes, on the one hand, and of the oldest known amphibians on the other. The Devonian Crossopterygian skull and fins appear to be "archetypal," to the lungfish type, on the one hand, and to the amphibian type on the other. Cope's genius in separating the Actinopterygii is sustained, for there is as yet no fossil evidence of the connexion of this group with the Crossopterygii, other than the supposed community of origin in Silurian times. Here the reader should consult the writings of Smith Woodward, Joseph F. Whiteaves, Bashford Dean, William K. Gregory and the synthetic reviews of Osborn (1918) and Lull (1917).

*Origin of Amphibians and First Tetrapods.*—In this epoch-making transition from the fringe-finned fish type to the tetrapodal amphibian and terrestrial type, the prophecies of Huxley, Cope and Baur and other great anatomists of the second and third groups of palaeontologists appear to be fulfilled. The Silurian period marked the parting of the ways among the great

primary groups of fishes and the first steps towards the frame of the terrestrial amphibians. Not until the Upper Devonian of Pennsylvania do we find a footprint (*Thrinops antiquus* Marsh), which may be referred to an amphibian tetrapod. The first known actual skeletons occurred in the Coal Measures (Upper Carboniferous) of Europe and America and represented four widely radiating groups. The structural gap separating the earliest tetrapod amphibians and fishes is perhaps the greatest known in the whole range of vertebrate evolution, but all modern authorities agree that the amphibians were probably derived from a Silurian or early Devonian type of fringe-finned fish. Even as far back as the Upper Carboniferous and even in the Lower Carboniferous the Amphibia were adaptively radiating into several orders and numerous families comprising highly specialized forms. During the Carboniferous we find numerous independent phyla of cel-like or burrowing, and of compressed, swimming, as well as of large-bodied, predatory forms. The latter culminate in the gigantic labyrinthodonts of the Triassic. The exact connexion of any of these forms with the modern Amphibia (urodeles and Anura) is doubtful. The Anura first appear in the Jurassic, and at the present time they retain many characters reminiscent of such Palaeozoic Amphibia as the branchiosaurs and the *Eryops* group. The urodeles are first known in the genus *Hylaeobatrachus* of the Lower Cretaceous of Europe. Both groups, especially the Anura, appear to have gone through a wide adaptive radiation during the Tertiary. The connexion of the modern caecilians with the ancient types is obscure. The reader is referred especially to the contributions of Williston, Case, Watson, Gregory, Broili, and the synthetic reviews of Osborn (1918) and Lull (1917).

*Origin of Reptiles.*—The oldest-known reptiles, solid-headed *Cotylosauria* of Cope, are regarded as amphibians which had eliminated the aquatic stages in development, the oldest reptile actually known being the genus *Eosaurus* from the Coal Measures of Ohio. In other words, the cotylosaur reptiles are traceable to solid-headed stegocephalian amphibians, which, in turn, are traceable to solid-headed unknown Crossopterygians of Silurian times. The oldest and most primitive reptiles (*Cotylosauria*) occurring in the Upper Carboniferous and Permian, are thus structurally very close to certain contemporary stegocephalian amphibians. The first great adaptive radiation of the reptiles into the two grand divisions, the solid-headed (*Cotylosauria*) and the temporal-arched (*Pelycosauria*), began in the Upper Carboniferous and still more widely diverged in Permian times. As early as the Permian, occurs a mammalian-like series of reptiles which exhibits an extensive adaptive radiation and gives off one branch, the *Cynodontia*, which, in turn, survives into Triassic times and clearly approaches the mammalian grade of organization. From the primary temporal-arched also appear the forerunners of the Mesozoic reptiles, the plesiosaurs, ichthyosaurs, dinosaurs and pterosaurs, widely separated from each other in the Triassic and thus having their branches deep down in the Permian and Carboniferous, each grand division giving rise to an adaptive radiation of its own. These have been traced in detail by such authorities as Andrews, Dollo, Abel, von Huene, Williston and Osborn.

Here the reader is referred to the writings of Williston, Hatcher, Osborn, Merriam, Lambe, Lull, and especially during the past decade to those of Charles W. Gilmore of the United States National Museum, Washington, and of Dr. Robert Broom of South Africa, as well as to the synthetic reviews of Osborn (1918) and Lull (1917).

The two greatest achievements of the decade are the clearing up of the relationships of the primitive South African terrestrial Reptilia of the Perm-Trias, beginning with the solid-headed types (pareiasaurs) and ending in their highest expression, the mammal-like types known as *Cynodonts* and *Theriodonts*. The field explorations of Robert Broom and the profound comparative researches of D. M. S. Watson and of William K. Gregory have given us a clear comprehension of the habits and relationships of this first terrestrial radiation group. Williston and Case have covered the same great period in America.

*Origin of Birds.*—Palaeontologists still agree in endorsing Huxley's opinion that birds are "glorified reptiles." The origin of birds, according to recent reviewers such as Osborn and Gregory, brings us close to the two-temporal-arched (*i.e.* *Diapsida*) reptiles, namely, to the stem which also gave off the dinosaurs, the pterosaurs and the smaller parasuchians (*Euparkeria*). Fossil bird remains are extremely rare. The earliest bird known is the famous *Archaeopteryx* of the Jurassic of Solnhofen, Germany. This is largely a bird, excepting in the tail, the simplicity of the feather arrangement and the possession of teeth. According to the four-winged hypothesis of origin advocated by Beebe, we should some day discover a bird with parachute-like action in both fore and hind limbs. Recent contributions of note on this subject are those of Gerhard Heilmann (1913) and of William Beebe (1915), and the synthetic reviews of Osborn (1918) and Lull (1917).

*Origin of Mammals.*—Evidence has been accumulating rapidly in favour of the theory that the origin of the mammals should be traced to the more progressive terrestrial mammal-like reptiles (the *Cynodontia*) of the Permian and Triassic of South Africa and Europe, as described in the studies of Broom, Watson, Haughton, Osborn and Gregory. Structurally related to these *Cynodonts* are the so-called *Protodonts* of Osborn, *e.g.* *Dromatherium* and *Microdonodon* of the Triassic of North Carolina. But of equal antiquity are the multituberculates, *e.g.* *Plagiaulax* and *Microlestes*, widely spread over Europe and North America. No substantial additions have been made during the decade to our knowledge of this vague period; readers are referred to the reviews of Osborn (1918) and Lull (1917), also to the recent works of Gregory, *The Orders of Mammals* (1910) and *The Origin and Evolution of the Human Dentition* (1921).

*Origin of Primates and of Man.*—Combined palaeontological and anatomical evidence indicates that the source of the Primates is to be looked for among tree-living insectivorous mammals more or less closely similar to the modern tree shrews (*Tupaiaidae*) of Africa. This view advanced with ability by Gregory is in general accord with the opinion that during the phase of arboreal life many of the psychic and anatomical characters of the Primates were acquired. It was not until the Lower Eocene of North America and of Europe that there appeared undisputed Primates of lemuroid affinity, *e.g.* notharctids and tarsoids in America, adapids and tarsoids in Europe. At this time the zoological relation of the two continents was close and it would appear that while the primitive horses were acquiring their cursorial characters on the ground, these primitive lemuroids were acquiring their distinctive characteristics in the trees. Actual ancestors of the existing *Tarsius* of Madagascar have been found in France (*Pseudoloris*). The attempt of Ameghino to trace the higher Primates to South American types, *e.g.* *Hominaculus*, appearing in the Lower Miocene of Patagonia, is not supported, because these animals from the first are the true broad-nosed, *i.e.* platyrrhine, type still characteristic of South America. The Old World division of the catarrhines or narrow-nosed true Primates has been traced to the *Parapithecus*, described by Max Schlosser from the Lower Oligocene of Egypt. *Propliopithecus* is possibly unrelated to the true anthropoid apes and thus possibly related to the ancestors of man himself. Darwin's broad conclusion that man was derived from "some ancient member of the anthropomorphous subgroup of Old World Primates" is fully sustained by anatomical evidence, but the precise lines of descent are still in dispute. Some hold that the human line came from Middle Tertiary anthropoid apes allied to *Dryopithecus* of France and *Sivapithecus* of India, while others (including the present writer) regard the Hominidae as a widely distinct family separated especially by its upright walking gait, by the non-divergence of the great toe, and by the retention of its tool-making thumb. A series of masterly reviews of this whole question has appeared in the American Museum publications from Gregory, whose recent memoir *On the Structure and Relations of Notharctus, an American Eocene Primate* (1920) sums up our present knowledge of this whole subject. (See also ANTHROPOLOGY.)

*The Dinosaur Fauna of Alberta, Canada.*—The greatest new

achievement in exploration is the revelation of the dinosaur fauna of Alberta in the fossil beds extending along the Red Deer river, which were first made known to science by explorers of the Canadian Geological Survey in 1897, 1898, 1901. The first general review of this wonderful fauna was that of Osborn and Lambe, *On Vertebrata of the Mid-Cretaceous of the North West Territory* (1902), based chiefly on the collections in the Ottawa Museum. The American Museum explorations under Barnum Brown, which extended over ten years, have resulted in the discovery of the entire fauna of the middle portion of Upper Cretaceous time, a complete revelation especially of the dinosaur world as it approached the height of its adaptive radiation into herbivorous and carnivorous, armoured and defenceless, swift-moving and slow-moving types, which severally imitate more or less fully the long subsequent adaptive radiation of the mammals. In 1914 the Canadians renewed exploration, so that at present the Ottawa and Toronto Museums have rich collections, part of which has been described by the late Lawrence M. Lambe, while Osborn, Barnum Brown and W. A. Parks have also made known a part of this wonderful fauna. Two of the greatest extremes of adaptation, namely, *Deinodon* or *Gorgosaurus* and *Struthiomimus*, are figured in the accompanying Plate II. In the same plate appear some of the outstanding American discoveries of the decade.

#### NEW DISCOVERIES AMONG FOSSIL VERTEBRATES

*Fossil Fishes.*—Dr. A. Smith Woodward's *Fossil Fishes of the English Wealden and Purbeck* (1915-8) is a beautifully illustrated memoir of the most thorough, systematic type, well sustaining the traditions set by Traquair and by the author himself in earlier works. The period dealt with affords an interesting cross-section of the stream of piscine evolution, at a time when many of the old Mesozoic ganoids were dying out and the teleost fishes were beginning their remarkable expansion. Other important systematic memoirs are those by Stolley on the ganoids of the German Muschelkalk (1920) and by Stensjö (1921) on Triassic fishes from Spitzbergen. The latter memoirs contain a wealth of material of great morphological interest concerning the early stages in the evolution of the skull of the fringe-finned and ray-finned ganoid fishes; this discussion also throws light on the origin of certain elements in the skull of higher vertebrates. In this connexion should be mentioned the brief but highly important paper on *Eusthenopteron* by W. L. Bryant (1919). This fringe-finned ganoid is of particular interest because the construction of its skull and paired limbs approaches the type which may be expected in the piscine ancestors of the land-living vertebrates. The arrangement of the elements on the under side of the skull of this fish raises morphological questions of wide general interest. Papers by Watson and Day (1916) and by Gregory (1915, 1920) deal with the ancestral relations of these fringe-finned ganoids with the land-living vertebrates (tetrapods).

The swarming fauna of Devonian arthrodires, ptyctodonts, cladodonts and other archaic fossil fishes from the vicinity of Buffalo, N.Y., is ably described by Bryant and Hussakof in their *Catalog of the Fossil Fishes in the Museum of the Buffalo Society of Natural Sciences* (1918). A serious difficulty encountered by all students of recent and fossil fishes is the getting in contact with the vast and scattered literature of the subject. The great *Bibliography of Fishes* by Bashford Dean and his associates Eastman and E. W. Gudger (1917) will undoubtedly stimulate research in this field.

*Fossil Amphibians.*—The outstanding publications in this field are *The Coal Measures Amphibia of North America* by R. L. Moodie (1916) and a memoir on *The Structure, Evolution and Origin of the Amphibia* by D. M. S. Watson (1919). Moodie's memoir is a valuable description and compilation of the extensive and varied fauna of swamp-living amphibians of the American Coal Measures. Watson's memoir is a brilliant and highly original contribution to the classification and phylogeny of the labyrinthodonts. Much detailed work on fossil amphibians appears in papers by von Huene, Broom, Williston, van Hoepen, Haughton and others.

*Stem Reptiles*.—In the field of the oldest reptiles, those of the Carboniferous and Permian, perhaps the most important contributions are those by S. W. Williston and D. M. S. Watson. The former, in his paper on *The Phylogeny and Classification of the Reptiles* (1917), traces the rise of the common amphibian-reptilian stock through the "Protodopa," which are so far known only from certain footprints of Upper Devonian age. According to Williston, who built on Osborn's system of 1903-4, the primitive reptilian stock early divided into the following series:—

*Anapsida* (Cotylosauria and their specialized descendants, the modern tortoises and turtles).

*Synapsida* (Theromorphs or pelycosaurs, etc.; Therapsida, or mammal-like reptiles, the latter giving rise to the mammals; plesiosaurs).

*Diapsida* (reptiles with two temporal arches, such as crocodiles, dinosaurs, rhynchoccephalians; this stock gave rise to birds).

*Parapsida* (including the progansosaurs, ichthyosaurs, lizards, mosasaurs, snakes).

Watson (1917), in his *Sketch Classification of the Pre-Jurassic Tetrapod Vertebrates*, assigns a high value in classification to the characters of the brain-case. A general and conservative classification of the early reptiles is given by W. K. Gregory (1920). The most primitive known reptile, *Seymouria*, from the Permian-Carboniferous of Texas, almost bridges the gap between the Amphibia and the Reptilia. Watson (1919) gives a morphological description of this reptile, accompanied by valuable figures and reconstructions of the skull and skeleton.

The habits and environments of the teeming reptilian and amphibian faunas of the Permian-Carboniferous of North America are intensively considered in a memoir by E. C. Case (1919), which also deals with the stratigraphy, climatology and palaeogeography of the late Palaeozoic.

*Mammal-like Reptiles*.—In no other field of fossil reptiles has the progress of discovery been more satisfactory than in that of the mammal-like reptiles of South Africa, as set forth in numerous papers, especially by Watson (1913-4), Houghton (1918), Broom (1913-4), van Hoepen and others. The relationships of these animals with other reptiles and with the mammals have been reviewed by W. K. Gregory (1920-1).

*Marine Reptiles*.—These have always been of great interest on account of their secondary adaptations to aquatic life which have been ably discussed by Abel (1912, 1919). One of the outstanding contributions of new material in this field is the *British Museum Catalogue of Marine Reptiles of the Oxford Clay* by C. W. Andrews (1910-3). The origin and relationships of the plesiosaurs and their allies are treated by von Huene (1921).

*Dinosaurs*.—The Triassic dinosaurs of Europe are of particular interest because some of them tend to connect the very diverse carnivorous and herbivorous saurischian dinosaurs of later ages. Here the leading authority is F. von Huene, in a long series of papers and memoirs. *Plateosaurus*, perhaps the most primitive of these reptiles, has been fully described both by von Huene and by Jaekel (1913-6). Primitive dinosaurs from the summit of the Karroo series in South Africa (*Gryponyx*, *Massospondylus*, etc.) are described by Broom and Houghton. During the long ages of the Jurassic the gigantic sauripodous dinosaurs attained their maximum in size and specialization. The leading feature in this field is the description of the strange and monstrous dinosaurs of the Tendaguru fauna of East Africa in the collections of the Berlin Museum, by Jaensch (1914). One of the most remarkable of the North American sauropods is the genus *Camarasaurus*, which has been intensively described by Osborn and Mook (1921). *Barosaurus*, a gigantic relative of *Diplodocus*, with a tremendously heavy neck, has been described by R. S. Lull (1919). *Tyrannosaurus*, the greatest carnivorous reptile of all time, and *Struthiomimus*, a contemporaneous ostrich-like dinosaur, have been described by Osborn (1912-9). The highly varied and grotesque armoured dinosaurs, namely, the Ceratopsia and related groups, have been the subject of numerous papers by Gilmore, Brown, Lambe and others.

*Pterosaurs*.—The pterosaurs, or flying reptiles, have continued to excite the interest of students of flight, such as Abel (1921), Watson and Hankin (1914), Arthaber (1921). The greatest

flying reptile, *Pteranodon*, is the subject of a memoir by Eaton (1910) of Yale University.

*Chelonians*.—An important memoir by O. Jaekel (1913-6) describes the skull, skeleton, carapace and plastron of *Triassochelys dux* from the Upper Triassic of Germany. Although widely differentiated from all other orders this reptile was the most primitive of all known chelonians. Of even greater interest is the *Eumelosaurus* from the Permian of South Africa which Watson (1914) describes as a veritable "Archichelone."

*Fossil Birds*.—*Diatryma*, a gigantic ground bird from the Lower Eocene of Wyoming, has been described by W. D. Matthew and W. Granger (1917) from a nearly complete skeleton, which is a most rare and valuable fossil. This bird, which has no near relatives, was about seven feet high and of massive proportions, with an enormous head and great compressed beak. The wings were vestigial. This high degree of specialization at such an early epoch indicates that the modernized groups of birds were differentiated during the latter part of the Age of Reptiles.

*Monographs on Special Groups of Tertiary Mammals*.—The fossil mammals of the basal and Lower Eocene of the western United States are represented in the American Museum of Natural History by collections numbering many thousands of specimens which are being described jointly by Matthew and Granger (1915). Besides describing many new or little known forms these authors also deal with the relationships and morphology of the various groups of early placental mammals. In the paper dealing with the edentates and their relatives, the "palaeandonts," Matthew (1918) advances the view that the modern *Pliodonta* (Pangolins) are an offshoot of the primitive "palaeandonts" of the Lower Eocene. Other papers of the same series cover the Creodonts, Insectivores, Primates and Condylarths.

Several mid-Tertiary mammalian groups, such as chalicotheres, entelodonts and the diceratheres, have been revised in the publications of the Carnegie Museum, Pittsburgh, by W. J. Holland and by O. A. Peterson.

*Baluchitherium*, perhaps the most gigantic land mammal of all time, has been described by C. Forster-Cooper (1913) from a huge atlas, astragalus, cervical vertebrae and limb bones from the Upper Oligocene deposits of the Bugti Hills of Baluchistan.

The evolution of the Sirenia is treated by Abel (1921) and by Depéret (1920), that of the Cetacea by Abel (1919) and by Winge (1918-21). The phylogeny and evolution of the Proboscidea are considered in the researches by Schlesinger (1917), Matsumoto (1915) and Osborn (1918-21). The Eocene and Oligocene titanotheres have been dealt with in numerous papers by Osborn in preparation for his monograph on these extinct animals. The revision of the mid-Tertiary Equidae by Osborn (1918) affords an exceptionally full document on the exact course of evolution in the multitudinous phyla of a typical mammalian family. A most valuable expansion of our knowledge of the anthropoid apes of the mid-Tertiary is found in the work of Pilgrim (1915) on the fossil apes of India of the genera *Dryopithecus* and *Sivapithecus*.

*South American Fossil Mammals*.—The strange offshoots of the ungulate and edentate orders which swarmed in Patagonia during the mid-Tertiary and Pleistocene times are treated in the excellent memoirs of the Princeton University Patagonian expeditions by W. B. Scott. Herluf Winge has admirably monographed the fossil and recent edentates of Brazil. The mammalian fauna of the Desado formations is described by F. B. Loomis of Amherst College. These and other investigations are correcting the erroneous correlations by Ameghino, in which the older mammal-bearing horizons of Patagonia were assigned to the Cretaceous. This more modern work indicates that the Pyrotherium beds are not older than Upper Eocene and that the Santa Cruz formation is of Lower Miocene Age.

The Pleistocene fauna of Tarija, Bolivia, is the subject of a beautiful memoir by Boule and Thévenin (1920), in which the anatomy and relationships of "*Mastodon*" andium and of the highly specialized horses *Hippidium* and *Onohippidium* are treated.

*Pleistocene Mammalian Faunas (North America, Europe).*—The Pleistocene represents the climax of the Age of Mammals in point of differentiation and richness of mammalian faunas. In Europe the Pleistocene faunas have been the subject of memoirs by Boule, Schoetensack and many others. In North America we have the teeming fauna of the Rancho La Brea, California, described by Merriam, Stock and their colleagues of the university of California. The correlation of the American Pleistocene faunas has been treated especially by Osborn and by Hay.

In the preparation of this article the writer is especially indebted for the entire invertebrate section to the coöperation of Miss Marjorie O'Connell, who has summarized the chief discoveries in Pre- and Postcambrrian time and given a review of the outstanding literature in the invertebrate field. He is also indebted to Charles D. Walcott, chief authority on Cambrian and Precambrian life of the world, for the type figures assembled in Plate I; to Curators Matthew and Gregory of the American Museum for a revision of the text relating to the evolution of the vertebrates; and to the President and Trustees of the American Museum for permission to reproduce the photographs which are assembled to the same scale on Plate II. (H. F. O.)

**PALESTINE** (see 20.600).—During the earlier years of the decade 1911–21 little of importance occurred in that country. Afflicted by the economic stagnation and financial strain which affected the whole Ottoman Empire in consequence of the war with Italy (1911–2), and the war with the Balkan States (1912–3), Palestine was unable to develop herself in any way before the outbreak of the World War in 1914. Yet to a section of her population the decision of the Palestinian Jews, in the autumn of 1913, to reject German and insist upon Hebrew as the language of instruction and to secede from the *Hilfsverein* and set up schools of their own, was momentous. The outbreak of the World War, besides leading to a renewed blockade of the coast, and fresh military requisitions, also involved the expulsion or internment of numerous ecclesiastics and laymen of Entente nationalities and the deportation of numbers of Jews. It was followed at the beginning of 1915 by one of the most destructive visitations of locusts recorded for a generation. Thereafter until the arrival of the British army in the autumn of 1917 the prosperity of the whole country slowly withered under the crushing burden of the war.

At the time of the British occupation of Jerusalem in Dec. 1917 the economic situation of southern Palestine was bad. Not only had the Turks requisitioned far and wide without repayment, or against inadequate payment, but they had cut down numbers of olives and revenue-producing trees and carried off the greater part of the agricultural and draught animals. The paper currency had depreciated some 84% and was no longer accepted by the producing classes—mostly outlying Moslem peasants—who would only discover their concealed stores of grain for gold. The civil population of Jerusalem, dependent ordinarily upon the pilgrim traffic or upon the offerings of pious Jews for its livelihood, was emaciated and reduced by starvation. The only products which Jerusalem had to sell were designed for the pilgrim trade and were unmarketable; consequently at the beginning of the occupation many shops were able to offer only cigarettes, picture-postcards and wild radishes for sale.

In view of this it was urgently necessary to provide food for the exhausted inhabitants of Jerusalem and Palestine, to provide work for the purpose of enabling them to earn money with which to pay for the food, and to re-start trade in order that the mercantile community should have something to barter against the gold hoarded by the peasantry and thus make it worth the peasant's while to cultivate and market his produce as he had for some time past realized that his gold was unable to buy the trade goods he required. But there were grave difficulties—the single line of railway by which alone food or trade goods could be brought from Egypt was very fully occupied with the paramount needs of the army. The daily tonnage of supplies alone—not including munitions or transport of men or guns—varied from 800 to 2,300. Ammunition was often 250 tons per day. The civilian population was unaccustomed to the Egyptian currency and more than suspicious of paper money, and Egyptian silver put into circulation was at once hoarded against the prox-

imate return of the Turks, which was confidently predicted by enemy sympathizers who further assured every one that the Egyptian paper pound at par was worth no more than the depreciated Turkish paper lira and offered to prove it by readily exchanging Turkish for Egyptian pounds whenever possible—at a profit to themselves of 17s. 7d. on each deal. Yet without money the civilians could not buy food, without food they could scarcely walk from weakness, and there was every prospect of the establishment of a vicious circle.

Brig.-Gen. G. F. Clayton (afterwards Sir Gilbert Clayton), chief political officer to Gen. Allenby, was appointed chief administrator and began to construct such a form of government as is provided for in "The Laws and Usages of War" laid down by international agreements embodied in the Hague Convention. Transport for a few truck-loads of foodstuffs per week was secured from the military railway, and lorries brought it to Jerusalem until the army was able to reopen the narrow-gauge line from Ludd to the Holy City. Then a small consignment of trade goods came up from Egypt and merchants were permitted to import small quantities from Egypt independently of the over-burthened railway. The labour corps employed numerous civilians, paying them at first daily in Egyptian silver and paper, and then weekly in cash or kind at the choice of the labourer. In this way the new currency came to its own, helped by the stringent measures taken by the military administration to suppress trafficking in or artificial depreciation of Egyptian paper. With the arrival of trade goods in the towns the peasants began to spend their gold and sell their produce so freely that it became unnecessary to import so much food and more accommodation thus became available for other merchandise. But even so, 900 tons of cereals had to be imported monthly for the use of refugees alone. Gen. Clayton took other steps to restore public confidence and reestablish the amenities of civilization. Bazaar gossip and rumour which for some weeks was hostile to the British was counteracted by the publication of Arabic and Hebrew editions of the newspaper, *The Palestine News*, which had been started by the army in March 1915, and intercourse with the greater part of the world was rendered possible by the restoration of the postal service, for which special stamps for the use of the civilian population began to be issued on Feb. 16 1918. Steps were taken to reassure the Moslems, who were much alarmed at reports sedulously propagated by the enemy, that all land was to be given to the Jews, and resident British officers were appointed to administer the various *kasas* of the old Turkish regime. Thus military governors were established at Gaza, with a deputy at Mejdal; at Jaffa, with a deputy at Ramleh; at Beersheba; at Hebron, with a deputy at Deir Aban; and at Jerusalem, with deputies at Bethlehem, Jericho and Ramalla. At first the Occupied Enemy Territory Administration ("O.E.T.A.") was at Bir Salem, near Ramleh, the general headquarters of the army, but later when it became impossible for Gen. Clayton any longer to combine O.E.T.A. with the work of the political mission, Maj.-Gen. Sir Arthur W. Money was appointed chief administrator in April 1918, and he removed the administration to the imposing and convenient Empress Victoria Hospice built by the Germans on the Mount of Olives just before the war. In March the country had so far recovered that it became possible to collect taxes once more, in May public confidence was greatly increased by the skilful and tactful handling of the great Moslem religious festival of the Nebi Musa pilgrimage, invented by the Turks as an artificial check on the great Christian gathering at Jerusalem for the Orthodox Easter, with which it always coincides regardless of the Moslem calendar, and by the successful way in which the dangerous, and often fatal, ceremony of the Holy Fire on the Orthodox and Gregorian Easter was conducted by Col. Storrs the military governor of Jerusalem, and Haddad Bey the Syrian chief of police.

During the summer the administration was able to resume the payment of revenues appropriated by international agreement to the service of the Ottoman debt, but the income of the Moslem Waqfs (pious foundations) was used for the benefit of Moslem beneficiaries in Palestine instead of being drained

away to Constantinople. A local police force was built up, schools and law courts reopened and the country benefited largely not only by the roads and bridges built by the army, but from the wages paid locally by the army for labour and the transport system established by the army for the use of civilians. In the absence of the ordinary pilgrims the army furnished excellent substitutes, and Jerusalem began once more to flourish on the money freely spent by military visitors.

In April 1918 the Royal Engineers undertook a work of permanent utility to Jerusalem by way of compensating the inhabitants for the use made by the army of their carefully stored water supply. At that time the city depended upon an aqueduct yielding 1,650 gal. per hour and upon rain-water storage of about 360,000,000 gal. A new reservoir containing 200,000 gal. was built above the town and fed from the Wadi 'Arrub springs 12 m. S. (used for the same purpose in the days of Herod and Pontius Pilate by the Romans) at the rate of 12,500 gal. per hour. This system, opened on June 18, was subsequently improved by the British administration.

The visit of the Zionist commission under Dr. Chaim Weizmann and the careful abstention from controversial topics of the only Palestine newspaper did much to abate the alarm of the Moslem population caused by Mr. Balfour's declaration. A further useful function was performed by the army in its sales of young camels and cast army beasts by public auction at Ramleh. According to local standards a "cast" army animal was in more than the prime of life and buyers came from the Hejaz and other parts of Arabia to buy the baby camels which had been born of unusually well-fed and healthy parents and had themselves been nourished on a scale of efficiency entirely unknown to native camel masters.

Later in the year when the Sept. advance had finally driven the Turks out of Palestine the O.E.T.A. was divided into three sectors—South (Jerusalem) East (Damascus) and North (Beirut). A little later, after the Armistice of Nov. 11 1918 and the subsequent occupation of Cilicia, O.E.T.A. North became O.E.T.A. West, and a new north sector was formed at Adana. In O.E.T.A. South, of which Gen. Money continued as chief administrator, British military governors were established at Nablus with a deputy at Hable; Jenin with a deputy at Beisan; Tul Keram; Haifa, with deputies at the Jewish colony of Zimmarin and Acre; and Nazareth with deputies at Tiberias and Safed. On August 15 1920 the system of governorships for Palestine was revised, Hebron was added to Jerusalem, Tul Keram was added to Jaffa, Nazareth and Tiberias were amalgamated to form Galilee, Haifa district became Phoenicia, and Nablus and Jenin were amalgamated to form Samaria. Thus Palestine is now administered by five district governors at £E1,200 a year each, with the help of assistant governors and by two district governors at £E850 each (Gaza and Beersheba).

In the spring of 1919 Sir Arthur Money was succeeded as chief administrator of O.E.T.A. South by Maj.-Gen. Sir Louis Bols, formerly General Allenby's chief of staff, who had to contend with a difficult situation. As no peace settlement had been arrived at, he still had to administer the country on Turkish lines in conformity with the "Laws and Usages of War," while on the one hand eager Zionists complained that nothing was being done to carry out the Balfour declaration as interpreted by its most extreme partisans, and on the other the Moslems protested against what they considered to be Jewish aggression, and various foreign powers sought to establish or revive their influence among the various Christian communities in the country. The Arab tribes beyond Jordan were not under proper control, as the Sherifian government in Damascus was not strong, and parties of desert freebooters revived the time-honoured custom of raiding the settled lands. This combined with the anti-foreign agitation which arose out of the difficulties and delays caused by the contradictory assurances given at one time and another on behalf of the British Government to the French and the Arabs led to serious trouble which was brought to a head soon after the Emir Faisal had been declared King of Syria in Damascus (March 10 1920). In Jerusalem the Moslem procession at the Nebi Musa celebrations was exploited as a manifestation of Arab Nationalist sentiment against the Zionist Jews, many of whom had excited the animosity of the Moslems

by unwise and tactless propaganda. Public statements had been made which Moslems could easily misunderstand and represent as threats against their own undisturbed possession of their ancestral properties and sacred sites, and a counter-propaganda directed towards a general agreement of Moslem land-owners to refuse to sell or lease land to non-Moslems had played its part in inflaming the crowd against Jewish immigrants. Riots took place on April 4 and 5, and, as the Moslem police in many cases preferred to yield to religious enthusiasm instead of doing their duty impartially, order had to be restored by British and Indian troops. The casualties were 5 Jews and 4 Moslems killed, 211 Jews, 22 Moslems and 2 Christians wounded. A number of persons were arrested and among the Jews sentenced for "possessing firearms, instigation to disobedience by arming the populace, conspiracy and preparing means to carry out acts of riot" was Mr. Vladimir Jabotinsky who had played a distinguished part in helping to raise a Jewish battalion for the British army. Several Moslems were sentenced to long terms of imprisonment for rape or for possessing firearms. Mr. Jabotinsky's sentence was shortly afterwards reduced and he was released on July 8 under the amnesty which followed the introduction of civil government. Later in April, the Ghazzawiye Arabs raided Beisan on several occasions and carried off 119 head of cattle and 259 sheep and goats, and on April 24, 2,000 Arabs attacked the British garrison at Semakh, but had to retreat leaving 100 casualties behind them. Raids were also made further down the Jordan valley, and in the N. some 2,700 refugees, Christians and Jews, fled into Palestine in May to avoid the Metawali who were massacring in the hills above Tyre.

On July 1 1920 the Rt. Hon. Sir Herbert Samuel became first high commissioner of Palestine under the mandate which was in principle accorded to Great Britain at the San Remo conference in April, although the text of the document was not drafted until 1921 and its precise terms had not yet actually been confirmed by the council of the League of Nations. Civil Government was introduced, and for the first time, the British flag was hoisted over Jerusalem. An amnesty was granted (July 8), the censorship was abolished (July 19), and on August 31 an advisory council composed of seven Moslems and Christians and three Jews was created to sit with the high commissioner. At the same time Hebrew was declared an official language together with English and Arabic, and made obligatory for public notices in areas inhabited by 20% or more of Jews (Jerusalem City, and the kazas of Jaffa, Tiberias, Safed, Ramleh and Haifa). Drinking-bars were suppressed throughout Palestine, and the use of stucco and corrugated iron for new buildings or repairs within the walls of Jerusalem was prohibited.

At the end of 1920 the payments of various dues to the account of Ottoman Regie and the prohibition against the cultivation of tobacco in Palestine came to an end.

**Frontier.**—On Dec. 23 1920 the frontiers of Palestine towards French Syria were fixed in such a way as to include a small additional area, comprising Kades, Metulla and Dan, in Palestine, but retaining the whole of the Litani-Leontes watershed for Syria. In April 1921 the visit of Mr. Churchill, Secretary of State for the Colonies, to Jerusalem, afforded an opportunity for interview with the Emir 'Abdalla, brother of the Emir Faisal, which resulted in the recognition of Arab authority over the territories to the east of Jordan (see TRANSJORDANIA), thus fixing that river as the eastern boundary of Palestine except at Semakh on the Sea of Galilee.

**Immigration.**—During 1920, as transport became available, a number of expatriated Jews began to return to Palestine, as well as new Jew immigrants, many of whom (*Halutenim*) were employed by the Zionists in the work of opening up and reconstructing waste lands, for additions to which the Jewish National Fund raised £160,000 during the year. On Oct. 22 1920 the deported German colonists, chiefly from the Haifa district, were allowed to return.

Some of the new immigrants seem to have adopted communistic views before leaving Russia, and on May 1 1921 a party of these disturbed a Jewish labour meeting at Tell Aviv ('Ahi), near Jaffa. A struggle ensued in which Moslems became involved, and this developed into a racial riot of so formidable a nature that the local police were unable to suppress it, and British troops had to be called in. Although the riot was stopped that evening, there was further trouble for two or three days. At no time, however, did the troops have to open fire in Jaffa, but the rioters killed 30 Jews and 10 Arabs and injured 170 Jews and 57 Arabs, before order was restored.

The police arrested 66 rioters, and the leading notables of both religions concerned cooperated with the authorities in calming the population. An inquiry was subsequently held by the Chief Justice of Palestine and two British officials, while Jewish immigration into the Holy Land was suspended for two months (until July 8).

**Jewish Agricultural Colonies.**—For many years past the piety of Jews all the world over has prompted them to contribute towards the support of the large numbers of Jews resident in or immediately outside Jerusalem on the understanding that the constant prayers and wailings of these—the Jews of the *Halka*—should benefit also their benefactors. A more modern development of this system led to the foundation of a number of agricultural colonies in other parts of Palestine, which also were for many years dependent upon outside benevolence. With the growth of experience the agricultural colonists, unlike their brethren of the *Halka*, tended to become more and more self-supporting under the guidance of Baron Hirsch's foundation, the J. C. A. (Jewish Colonization Association), which first began to treat the colonies as a commercial rather than a charitable or sentimental proposition. The earlier colonies had devoted themselves exclusively to viticulture and were embarrassed alike by the attacks of phylloxera and the difficulty of marketing their wine. After the introduction of almonds and oranges and other fruits prospects improved, but until the end of the Turkish period the colonies were much hampered by legal difficulties connected with the purchase and tenure of land, the status of the colonists and the lack of a definite policy. During the war the colonies suffered owing to the deportation of many of the colonists, the requisitions of the military, and the cutting down of large numbers of trees, as well as from the loss of all their foreign markets.

After the war the Zionist Commission greatly improved the prospects of Jewry in Palestine, which, under the Balfour Declaration of 1917, was to become once more a national home for the children of Israel, by organizing a new national life and arranging for the immigration of the *Halutzim*, or Pioneers, young and zealous workers from all parts of Jewry, who began to prepare the country for future arrivals. In 1920 the influx of Jews into Jerusalem was shown by the Immigration Department of the Zionist Commission as follows: Jan. 122, Feb. 139, March 124, April 122, May 98, June 105, July 107, Aug. 178, Sept. 237, Oct. 197, Nov. 218, Dec. 233; total 1,860, of whom 1,251 were men and 609 women, of whom again 1,169 were new immigrants and 696 returning refugees. Sept. is the principal port of entry, 1,400 Jews having landed there in Sept. 1921. It is estimated that between Dec. 1919 and March 1921 some 11,000 Jews entered Palestine, of whom 3,000 were returning refugees. On the other hand some 3,000 persons emigrated from Palestine during the same period, among whom were many Jews.

The bulk of the new immigrants, up to the end of March 1921, came from Poland, Russia, Morocco, Austria, Syria, Bulgaria, Rumania, Egypt, Hungary, Persia, France, Greece, Germany and England. Each immigrant is provided with a certificate of origin from the Zionist Emigration Office (Palestine Office).

The table shows the area and population of the Jewish colonies founded before the British occupation:—

**Land Transfer.**—During the whole of the military administration and until Oct. 1920 the sale or transfer of land in Palestine was forbidden, partly because the Turks had removed all official land registers to which appeal could be made for the settlement of disputed titles, and partly to avoid internal trouble which might arise from the transfer of land from a vendor of one religion to a purchaser of another. When this order was rescinded there was no great activity in the estate market in Palestine as a strong movement had been set on foot among Moslems to retain land already owned by Moslems in Moslem hands, and also because the delay in issuing the Mandate and the world-wide financial crisis militated against the economic development of Palestine in general, and land purchase there in particular. Some small parcels of land belonging to Moslems were sold to Jews, but, apart from that, the Jews have acquired no land since the war, with the exception of the university site on Mt. Scopus from the executors of Sir John Grey-Hill.

**Ecclesiastical.**—In matters ecclesiastical the British authorities were able to steer a careful course between the various conflicting interests, and Col. Storrs, the governor of Jerusalem, was so far able to abate the customary tension between the representatives of the different creeds that the Orthodox at Bethlehem voluntarily removed the unsightly wall which had been built across the nave of the Church of the Nativity chiefly for the purpose of causing annoyance to the Latins; and the Gregorians invited the Anglican bishop, Dr. MacInnes, who had succeeded as bishop in Jerusalem after the resignation of Dr. Blyth in Oct. 1914, to take an important part in their Easter ceremonies in 1918. After the final defeat of the Turks the Orthodox and Latin patriarchs who had been held prisoners in Damascus returned to Jerusalem, when Mgr. Damianos, who had had difficulties with his Holy Synod, was reinstated by the chief administrator. Mgr. Cassezi, the Latin patriarch, however, withdrew soon afterwards to Rome, where he became a cardinal, and in April 1920 Mgr. Louis Barlassina was appointed to succeed him in Jerusalem, while on Oct. 9 1920 Father Paschal Robinson was sent to Palestine as apostolic visitor. On March 20 1921 His Eminence the Grand Mufti of Jerusalem, Kamil Huseini Effendi, died, and

after some delay his brother, Hajj Amin, was appointed (May 1921) to succeed him.

**Population.**—On March 31 1919 the pop. of O.E.T.A. South was 627,850, of whom 515,000 were Moslems, 65,300 Jews and 62,500 Christians. There were 150 Samaritans and 4,900 others. The present area of Palestine is larger than O.E.T.A. South.

The 1919 census figures for the pop. of various towns, showing Ruppin's 1914 estimate in each case in brackets, are as follow:—

	1914 Estimate of Ruppin	Census of 1919
Jerusalem	(80,000?)	60,000
Jaffa	(40,000?)	40,000
Nablus	(30,000)	28,000
Haifa	(20,000)	20,000
Hebron	(20,000)	18,000
Gaza	(30,000)	—
Nazareth	(12,000)	15,000
Safed	(24,000)	12,500
Acre	(12,000)	10,000
Tiberias	(8,000)	8,000
Bethlehem	(12,000)	15,000

Gaza, credited with 30,000 inhabitants in 1914, was entirely depopulated during the war as a military measure by the Turks. The inhabitants were beginning to return slowly to the completely ruined town in 1921.

Of the three divisions of the pop. of Palestine—69% of the Moslems, 46% of the Christians and 19% of the Jews were engaged in agriculture in 1919. In 1918 taxes were paid on 139,000 domestic animals (Southern Palestine only), in 1919 on 531,000 animals (Northern Palestine as well) and in 1920 on 543,000.

**Finance.**—The budget for Palestine for the first year under British occupation, ending Oct. 1918, showed a revenue from direct taxes £160,000, from customs and excise £122,000 and from other normal sources £54,000. The artificial revenue of £324,000 drawn from the operation of the services of relief for refugees failed to balance their cost, £331,000, thus the revenue for purposes of ordinary expenditure amounted to £133,000 and the expenditure to £407,000, which included £141,000 of revenues mortgaged by the Turks for the services of the Ottoman Debt and to meet the kilometric guarantee on railways in other parts of the Empire. It should also be remembered that, while the cost of administering northern Palestine for six weeks is contained in the budget, no revenue at all was collected in that area, as the taxes had all been exacted in advance by the Turks. On the other side, however, it must be noted that the private charity of the American Red Cross and other funds contributed more than £40,000 *per mensem* towards the maintenance of refugees and destitute civilians, which would otherwise have been a charge upon the Treasury.

In 1918-9 the actual receipts were £748,000 from all sources and the estimated expenditure £738,000. For 1919-20 the estimated figures were £735,000 for both, exclusive of £284,000 of revenue and £162,000 of expenditure in the "Excluded Funds" assigned to municipalities, Waqf administration, the Ottoman Debt and railway guarantee outside Palestine. For the first nine months of civil administration ending March 31 1921 the total revenue, excluding that from railways and post-office, was estimated at £776,000 and the expenditure at £731,000, while the railways and post-office were expected to yield a net profit of £30,000, thus showing a surplus of £75,000. For the first complete financial year under civil administration, 1921-2, the total revenue—including railways and post-office—was estimated at £2,214,000, and the expenditure at £2,286,000.

The following table shows the detailed revenue from direct taxation and State domains for the two financial years 1919-20 and 1920-1:—

		House and Land Tax ££	Animal Tax ££	Tithe ££	State Domains ££	Stamp Duty ££	Total ££
Jerusalem	1919-20	29,089	7,399	28,173	1,437	2,743	68,841
	1920-21	29,500	8,000	36,000	2,000	4,000	79,500
Jaffa	1919-20	27,261	2,150	57,733	499	3,134	90,777
	1920-21	26,000	1,200	60,000	600	4,700	92,500
Gaza	1919-20	15,781	3,348	52,401	848	361	72,739
	1920-21	16,000	1,900	60,000	2,000	500	80,400
Beer-sheba	1919-20	338	5,020	1,556	171	187	7,272

\*Dunam = 1,075.2 sq. yd.

The customs revenue collected at various ports of entry and railway and caravan centres for the same two years was as follows:—

	1919-20 £	1920-1 £
Acre . . . . .	214	534
Beersheba . . . . .	403	314
Gaza . . . . .	10,092	6,695
Haifa . . . . .	164,391	169,031
Jaffa . . . . .	146,204	186,336
Jerusalem . . . . .	93,779	71,161
Khan Yunis . . . . .	645	586
Ludd . . . . .	1,803	5,255
Tul Keram . . . . .	5,094	5,642
Qantara . . . . .	5,375	3,446
Total . . . . .	428,150	449,000

**Municipalities.**—There are 22 municipalities in Palestine: Jerusalem, Ramalla, Beit Jala, Bethlehem, Hebron, Jaffa, Ramleh, Ludd, Gaza, Khan Yunis, Mejdell, Feluje, Beersheba, Nablus, Tul Keram and Jenin in Samaria; Nazareth, Tiberias and Safed in Galilee; and Haifa, Acre and Shefa 'Amr in Phoenicia. In 1919-20 their total revenue amounted to £E89,000 (Jerusalem £E29,500, Jaffa £E14,700) and their ordinary expenditure to £E89,000. They had a balance of £E9,000 from the previous year and obtained loans and grants from Government amounting to £E10,000, repaying debt to the amount of £E11,000.

**Education.**—Palestine before the British occupation contained numerous schools supported by religious bodies and charitable organizations abroad, some of which were undoubtedly supported more in the political interests of the countries concerned than for strictly religious or educational purposes, and it is possible that in the future certain institutions may suffer financially from the decay of that political driving force. For the year 1919-20 the Military Administration granted £E46,000 for Moslem education, and for 1921-2 the Civil Administration has allotted £E103,000, and employs 443 teachers. In addition to this the Zionist Organization in 1920-1 provided for 135 educational institutions with 523 teachers and 12,830 Jewish pupils at a cost of about £E110,000. Christian schools in 1919-20, generally open to pupils of all denominations, provided for some 7,000 children, but many of these institutions had been adversely affected by Turkish requisitions during the war and had not recovered.

**Defence.**—Under the final rearrangement of the Ottoman army before the World War Palestine formed part of the recruitment area of the VIII. (Damascus) Army Corps, and after the war was held by a considerable army of occupation composed of British and Indian troops. This, consisting of three Army Corps with a ration strength of over 460,000 men and some 163,000 beasts at the time of the Armistice, was reduced to 23,000 men on April 1 1920, and to 7,700 men on April 1 1921. The scheme of local defence provides for the formation of two battalions of troops to be recruited in Palestine, and a police force has already been raised consisting on April 1 1921 of 78 officers and 1,392 other ranks, divided into four categories:—

	Mounted	Foot	Railway	Prisons
N.C.O.s . . . . .	47	72	4	16
Men . . . . .	397	712	50	85
				and 8 wardresses
Total . . . . .	444	784	54	109

**Railways.**—Although several schemes for railway construction in Palestine were proposed during the period 1910-4, nothing was done. On Oct. 14 1913 a Franco-Turkish agreement provided for an extension of the standard-gauge line from Rayak in Syria to Ludd in Palestine, where it would join the then existing narrow-gauge line from Jaffa to Jerusalem. By the same agreement a French firm was to obtain concessions for building harbours at Haifa and Jaffa, and a little later a concession was granted to the Perrier Bank to run a tramway from Jerusalem to Bethlehem. None of these proposals was carried out, but during the war the Turkish Government built an extension of the Hejaz railway from Jenin on the plain of Esdraelon through Messudiyeh (56 km.) to Nablus (15 km.) on the one hand, and on the other to Tul Keram (20.5 km.) and thence to Ludd (42.5 km.), and from Junction Station to Beersheba (83 km.), whence the line was taken on to El 'Auja (66 km.) for the attack on Egypt. A narrow-gauge branch line was run from Tine on the Junction Station-Beersheba railway to Beit Hanun (39 km.), near Gaza, with a branch from Deir Sineid to Jaffa (12 km.), and another from Tul Keram to the forest near Caesarea (24 km.), which was cut down for fuel. Owing to the shortage of railway material the lines between Damascus and Mezzeirib (63 km.), Haifa and Acre (18 km.) and Jaffa and Ludd (20 km.) were stripped and the rails sent south to be used for the new extensions. Later the Beersheba-El 'Auja extension was stripped in its turn and the Tine-Beit Hanun-Huj branch was removed after the arrival of the British.

The British-built standard-gauge line laid across northern Sinai, Qantara-Romani (41 km.), opened July 1916; Romani-El 'Arish (114 km.) Jan. 1917, El 'Arish-Rafa (45 km.) Mar. 1917, reached

Deir el Belah (219 km.) from Qantara in June 1917, and a branch from Rafa to Karm (34.5 km.) was opened Oct. 28 1918. This was later continued to Beersheba (24.5 km.) and opened May 3 1918. The metre-gauge railway from Ludd to Jerusalem, much damaged during the military operations in the autumn of 1917, was restored and reopened Jan. 27 1918. Meanwhile, the standard-gauge from Belah had been opened to Deir Sineid (28 km.) Nov. 28 1917, and to Deiran (43 km.) Jan. 8 1918. On Feb. 4 1918 it was opened to Ludd (15 km. or 305 km. from Qantara) and carried on to Rantie (9 km.) a little later in readiness for the next forward move. While waiting for this, the standard-gauge was opened to 'Artul (31 km.) on March 31 and to Jerusalem (29 km.) June 15. This last section was laid by day, while the narrow-gauge which it superseded continued to work by night. The Turkish narrow-gauge between Junction Station and Irgize (72 km.) on the Rafa-Beersheba line was converted to standard gauge between May 18 and July 8; thus Gen. Allenby was able to dispose of a double line of standard gauge from his advanced base at Ludd to Rafa, to which point the railway from Qantara had been double-tracked by April 17 1918. Later, in 1919-20, the sector Junction Station-Irgize was dismantled. A number of narrow-gauge lines were laid behind the front between Dec. 1917 and Sept. 1918: Ludd to Jaffa (20 km.), Ludd to Ras el 'Ain (22 km.), Sarona (on the Jaffa line) to near Jellil (14 km.), Keft Jinnis on the Ras el 'Ain line to Lubban (18 km.), Sheikh Muannis on the Sarona line to Carrick Hill (3 km.), and from Jerusalem to Bire (28 km.). The standard-gauge started north once more on the heels of the Sept. advance, and was superimposed on the Turkish line from Ras el 'Ain to Tul Keram (32 km. from Rantie) which was reached on Oct. 15. The extension to Haifa (66 km.; 413 km. from Qantara) was opened early in Jan. 1919 and soon afterwards the narrow-gauge Acre branch (18 km.) was restored. On Oct. 5 1920 the standard-gauge was opened between Ludd and Jaffa (20 km.).

**Agriculture.**—The crop returns for 1920-1 show the following figures in kilograms:—

	Kgm.
Wheat . . . . .	62,897,017
Barley . . . . .	27,233,948
Beans . . . . .	2,061,306
Peas . . . . .	3,441,525
Lentils . . . . .	2,724,635
Kersenneh (Jilbaneh) . . . . .	4,599,944
Durra . . . . .	30,352,916
Sesame . . . . .	2,488,229
Olive Oil . . . . .	6,706,059
Grapes . . . . .	5,490,306
Figs . . . . .	5,419,878
Melons . . . . .	16,351,022
Almonds . . . . .	238,090

Total . . . . . Kgm. 170,004,875  
Oranges, Lemons, etc. . . . . 537,043 boxes

Of this total of 170,004,875 kilograms the production according to districts was as follows:—

	Kgm.
Jerusalem . . . . .	27,589,480
Jaffa . . . . .	40,866,228
Gaza . . . . .	11,170,179
Phoenicia . . . . .	35,852,954
Beersheba . . . . .	9,005,058
Samaria . . . . .	17,686,452
Galilee . . . . .	27,834,524

Of the 537,000 boxes of oranges and lemons the Jaffa district produced 498,000, Phoenicia being second with 36,000.

**Trade.**—The bulk of the sea-borne commerce of Palestine passes through its three chief ports of Gaza, Jaffa and Haifa. Of these Haifa, before the war, had begun to supplant Beirut to a certain degree as the port of Damascus, the Hauran and Gilead and, in virtue of its connexion by rail with Medina, handled goods in transit for that area as well; consequently its trade was Syrian rather than Palestinian and recovered sharply after the end of the Italo-Turkish War in 1912. Gaza was concerned almost entirely with an export trade of barley, chiefly used for making beer in England, while Jaffa, with all its drawbacks, served as the chief port for exports and imports of purely Palestinian origin and destination. The standard-gauge railway leading to Egypt is also a great trade route, more particularly for passengers and those classes of goods which suffer from the delays still inevitable in bad weather at Jaffa.

The total trade of Palestine for the first complete year during which the whole country was under British administration and at peace, April 1919-March 1920, was:—

	Imports	Exports
April-June 1919 . . . . .	£E1,098,038	£E130,463
July-Sept. " . . . . .	861,869	129,719
Oct.-Dec. " . . . . .	984,926	106,552
Jan.-March 1920 . . . . .	1,296,334	236,968
	£E4,242,067	£E693,702

Of this the respective shares of Jaffa and Haifa as compared with the last complete year before the war—both calculated in £E—were:—

	Imports £E	Exports £E
Jaffa		
1913 . . . . .	1,279,785	726,775
1919-20 . . . . .	1,408,238	169,308
1920-21 (first 7 months) . . . . .	1,186,079	127,360
Haifa		
1913 . . . . .	516,750	338,033 (1912)
1919-20 . . . . .	1,627,381	270,057
1920-21 (first 7 months) . . . . .	950,155	116,795

From this it is apparent that while Palestine had to buy largely and at enhanced prices of those goods of which she was unable to procure adequate supplies during the war, she had not yet recovered her capacity for production after the dislocation of trade and ruin of agriculture caused by the war, with the consequence that the balance of trade was against her. It has been pointed out, however, that her exports are bulkier than her imports, and that had tonnage been available the exports would have been greater.

The deficiency of available tonnage is well shown in the following shipping figures for ports of Palestine:—

Flag	Number of Ships 1913	Number of Ships 1919-20	Tonnage 1913	Tonnage 1919-20
British . . . . .	307	97	464,674	123,116
Russian . . . . .	237	55	405,987	27,244
French . . . . .	101	41	262,512	71,904
Italian . . . . .	97	99	170,227	176,504
Austrian <sup>1</sup> and Other . . . . .	496	65	658,302	67,946
	1,238	357	1,961,702	466,714

**Currency.**—The currency in Palestine, formerly Turkish, became Egyptian at the time of the occupation as the accounts of the Egyptian Expeditionary Force were kept in that medium. A vast quantity of British, Australian and Indian silver, however, came into circulation at fixed rates to supply the deficiency of Egyptian silver—of which a large consignment sent from the London mint for use in Palestine was sunk by enemy action at sea—and a good deal of gold, chiefly British, came into the country from Arabia where a large amount of the gold coin paid as subsidy to the king of the Hejaz passed into circulation. French silver, generally taken at full value in the larger towns before the war, is now seldom seen, and Turkish silver and billon money has also nearly disappeared, although legal tender at fixed rates. Turkish paper was never legal tender after the occupation.

Weights and measures still vary locally according to immemorial custom, but the civil administration is taking steps to introduce a standard system on European lines in order to facilitate trade.

**Archæology.**—On Aug. 9 1920 the British School of Archæology in Jerusalem was opened and participated in the excavations which were being conducted at Ascalon, with happy results, by the Palestine Exploration Fund. Important discoveries were made also in the Garden of Gethsemane, where the complete foundations of a 4th-century church were brought to light, and near Tiberias.

The duty of maintaining historical buildings in the Holy City has been entrusted to the Pro-Jerusalem Society—a pan-denominational body founded by the governor, Mr. Ronald Storrs. At Acre mediæval crypts have been cleared of debris, the Tower of Ramleh has been strengthened and arrangements have been made for a resumption of the excavations at Tell Hum (Capernaum) by the Franciscans. Three universities in the United States have agreed to undertake important archaeological researches, that of Pennsylvania at Beisan (Beth Shan), that of Harvard at Samaria and that of Chicago at Megiddo (for which Mr. John D. Rockefeller, Jr., gave \$60,000). Unauthorized excavations by persons unqualified as archaeologists are forbidden. In the Budget for 1921-2 a grant of £E1,000 was made for the conservation of historical monuments, and £E750 provided for the redemption of antiquities out of a total estimate for the Department of Antiquities of £E6,500.

(H. P. G.)

**PALGRAVE, SIR ROBERT HARRY INGLIS** (1827-1919), English banker and economist, was born at Westminster June 11 1827, the son of Sir Francis Palgrave, the historian (see 20-629). He was educated at Charterhouse and entered Barclay's Bank at Yarmouth. There he rose to a position of such importance that in 1875 he was one of three representatives of the English issuing country bankers chosen to give evidence before the select committee of the House of Commons on Banks of Issue. He edited the *Economist* from 1877 to 1883, and published many works on banking, as well as *The Local Taxation of*

*Great Britain and Ireland* (1871). He also edited the *Dictionary of Political Economy* (1894-1906). He was knighted in 1909. He died at Bournemouth Jan. 25 1919.

**PALLES, CHRISTOPHER** (1831-1920), Irish lawyer, last chief baron of the Irish Court of Exchequer, was born Dec. 25 1831. He was educated at Clongowes Wood school, and Trinity College, Dublin, where he graduated in 1852. He was called to the Irish bar in 1853, and became a Q.C. in 1865. In 1872 he became a solicitor-general for Ireland, and from 1872 was attorney-general. In 1874 he was made chief-baron of the Court of Exchequer. The Exchequer division was in 1898 merged in the Queen's Bench division of the Irish High Court of Justice, and the chief baron from that time sat as one of the judges of the Queen's Bench division, and also as a judge of appeal. Palles retired from the bench at an advanced age in 1916. He was a great lawyer, of remarkably wide learning and power of argument. He died in Dublin Feb. 14 1920.

**PALMER, ALEXANDER MITCHELL** (1872- ), American politician, was born of Quaker parentage at Mooshead, Pa., May 4 1872. After graduating from Swarthmore College in 1891 and admission to the bar in 1893 he practised law at Stroudsburg, Pa. He was a member of Congress from 1909 to 1915, was then appointed judge of the U.S. Court of Claims, but resigned four months later. In 1912 and 1916 he was a delegate-at-large from Pennsylvania to the Democratic National Convention, and from 1912 a member of the executive committee of the Democratic National Committee. At the convention of 1912 he was "floor leader" of the Wilson supporters, and the next year declined the post of Secretary of War in President Wilson's Cabinet. In 1917 he was appointed alien property custodian under the "Trading with the Enemy Act," and within 18 months was administering 32,000 trusts, valued at \$503,000,000. In March 1919 he was appointed to the President's Cabinet as Attorney-General. The Senate refused to confirm the appointment until his record as alien property custodian had been investigated, on the ground that he had made his office a "political machine." It was furthermore charged that he was in contempt of the Senate in having failed to submit on request a complete report of the management of his office. A filibuster at the end of the 65th Congress caused the Senate to adjourn without confirming the appointment, but the President made him a "recess" appointee. Not until Aug. 30 1919 did the Senate Judiciary Committee hand in its report recommending the appointment. This was followed by confirmation. His career as Attorney-General was widely, and it was generally felt justly, criticized by the public at large and by competent legal authorities as being both arbitrary and inefficient. At the Democratic National Convention in 1920 he had strong support for the presidential nomination, standing second on the first six ballots. After a prolonged deadlock, extending through 38 ballots, he released his delegates, who swung to James M. Cox, nominated on the 44th ballot.

**PALMER, SIR WALTER, 1ST BART.** (1858-1910), English manufacturer, was born at Reading Feb. 4 1858. He was the son of George Palmer (see 20.644), founder of the firm of Huntley & Palmer, biscuit manufacturers, of Reading, and was educated at University College, London, and also at the Sorbonne, Paris. He became a director of the firm and was also the first chairman of University College, Reading. He sat in the House of Commons for Salisbury during 1900-6. In 1904 he was created a baronet, and he died at Newbury April 16 1910. His elder brother, GEORGE WILLIAM PALMER (1851-1913), was chairman of the firm and sat in the House of Commons for Reading from 1892 to 1895 and from 1898 to 1904. He was made a privy councillor in 1906. He died near Newbury Oct. 8 1913.

**PANAMA** (see 20.664).—The pop. of the South American republic of Panama at the end of 1911 was estimated at 336,742 for the area exclusive of the Canal Zone. The latter contained in that year 71,682 persons, the number decreasing to 31,048 in 1916 and to 21,707 in 1918. In the estimate made in 1911, whites and *mestizos*, those of mixed blood, numbered 238,200, and negroes and Indians 96,600. Foreigners included 3,500 Chinese

<sup>1</sup> Much tonnage formerly Austrian was in 1921 Italian.

and 55,000 British subjects from Caribbean islands. The cities of Panama and Colon in 1917 contained 61,369 and 26,076 inhabitants respectively; the estimated total pop. then being 401,554. A general census taken in 1920 gave a total pop. of 434,015.

Vital statistics for 1916, 1917 and 1918 showed respectively 11,593, 10,898, and 11,283 births, of which in each year respectively 7,827, 7,511 and 7,700 were illegitimate. Deaths in the same years numbered 6,218, 6,107 and 5,649 respectively. There are eight provinces, Herrera having been added in 1915. The area as determined by the White boundary award is 87,480 sq. km. (33,776 sq. miles).

In 1917 there were 398 Government-supported schools with an enrolment of 22,000, besides 1,721 pupils in Canal Zone schools. The Instituto Nacional, dedicated in 1911 with handsome buildings at Panama costing \$1,500,000, gives instruction in high-school subjects, commerce and languages. A school of Law and Political Science offers a three-year course to graduates of the Instituto. Travelling scholarships to Europe and the United States are provided by the Government.

**Finance and Economics.**—Panama receives all the import duties collected, but the United States imports all canal materials and supplies for Government use duty free. Panama's revenues and expenditures 1915-20 were as follows:—

	Revenues	Expenditures
1915	£ 675,057	£ 635,820
1916	729,802	1,164,600
1917	793,882	732,171
1918	646,752	707,464
1919-20	1,490,385	1,490,385 (estimated)

Public finance is managed by a fiscal agent appointed with the approval of the United States. For nine months ending in March 1921, revenues received were \$4,012,023, and expenditures \$2,767,146; balance \$1,244,877; of this sum \$739,349 was set aside for road construction. The debt, begun early in 1915 with a loan of \$3,000,000 from the United States, chiefly for railway construction, amounted in 1919 to \$7,101,000.

Commerce is chiefly with the United States; but that with the United Kingdom, France, and Spain is important.

The totals for the years 1910-20 were:—

	Imports		Exports	
	Kgm.	Balboas *	Kgm.	Balboas *
1910	128,647,313	10,043,395.11	126,333,609	1,769,330.15
1911	128,331,874	9,896,987.85	165,180,189	2,863,425.30
1912	115,822,532	9,871,653.73	166,232,433	2,064,647.55
1913	153,057,605	11,060,088.24	187,330,063	5,101,960.45
1914	140,472,718	9,891,552.78	182,625,216	3,860,517.18
1915	126,244,629	9,032,977.17	152,594,343	3,422,455.10
1916	107,191,027	9,397,596.27	137,438,898	5,706,724.38
1917	82,798,113	9,223,170.00	177,484,046	5,624,176.00
1918	45,085,659	7,821,660.00	150,499,507	2,999,557.00
1919	48,960,768	11,406,880.15	162,476,039	3,757,028.24
1920	59,678,802	17,092,270.35	150,370,225	3,640,453.15

\* A balboa is worth a dollar.

About 80% of the exports go to the United States. The chief articles are bananas, coconuts, hides, tortoise shell, cacao and *lague* (vegetable ivory). All international commerce moves through Cristobal and Balboa, Bocas del Toro being reserved for local business. The Panama railway across the Isthmus, 47 m. long, is U.S. property. The United Fruit Co. has 150 m. of banana railway in Bocas del Toro province, running to Limón in Costa Rica. Only a small part of the territory is occupied, and little is under cultivation. The only highly organized industry is the banana business of the United Fruit Co., which exports over \$2,000,000 worth of bananas yearly. In 1906 cattle numbered 65,000; in 1916, 200,000; there were then also 15,000 horses, 2,000 mules, 30,000 hogs, and 5,000 goats. Coffee grows in Chiriqui province, and in Coclé province a concern of German origin has raised cacao, coffee and rubber since 1895. Tobacco and sugar are increasing; the first sugar exported to the United States was in 1920. Other crops are corn, rice, yams and ivory nuts. The tropical woods of the forests are exported, as are medicinal plants. The pearl fisheries are famous. Metals are scantily represented. The Sinclair Oil Corp. of New York has concessions on Columbus I., and has drilled wells at Bocas del Toro.

**History.**—The successful candidate of 1908 for the four-year presidential term, Domingo de Obaldia, died in 1910, and Pablo Arosemena completed his term. In 1912 Belisario Porras, a Liberal, was elected. Ramon M. Valdez was elected in June 1916 amid riots and intervention by the United States. He died in 1918, and Ciro L. Urriola completed his term. Ernesto Lefevre was inaugurated Jan. 30 1920, but Belisario Porras soon succeeded him, being elected in Aug. of the same year, and inaugurated Nov. 1 for a four-year term. There are three vice-presidents (*designados*), and a Cabinet of five members. The constitution

was amended Dec. 26 1918 so as to provide for a Chamber of 33 members, one for each 10,000 inhabitants. The president is chosen by direct vote, and is ineligible to succeed himself. Beginning in 1924 deputies of the Chamber are to be chosen by direct vote. Provincial governors became elective in 1920. Capital punishment is prohibited. Foreigners may not mingle in politics, and may be ejected for criticizing public officers or institutions. The independence of the republic was recognized by Colombia April 6 1914 by a treaty between the latter and the United States, ratified by Colombia in the same year and by the U.S. Senate April 20 1921. Panama ratified the Treaty of Versailles Jan. 8 1920, and is an original member of the League of Nations.

**Boundary Dispute.**—The constitution of Colombia of 1886 declared that its boundary with Costa Rica should be that which had existed between the viceroyalty of Nueva Granada and the captaincy-general of Guatemala in 1810, but that boundary lines might be located by treaties which might be negotiated without reference to the *uti possidetis* of that year. Colombia and Costa Rica endeavoured, by treaties negotiated in 1825, 1856, 1865 and 1876, to fix the line without success. In 1876 arbitration was agreed on, and Alfonso XII., King of Spain, was asked in 1880 to make an award, but he died before doing so. It was agreed in a treaty of Dec. 25 1880 that the arbitral award must lie within the specified limits of the conflicting claims. This provision was included in a treaty made at Paris dated Jan. 20 1886, and in another made at Bogotá on Nov. 4 1896. Under the last-named instrument, President Loubet of France rendered on Sept. 11 1900 an arbitral award which was accepted by Colombia and Costa Rica as final. Its demarcations were in general terms.

The state of Panama, which had been created by Nueva Granada in 1855 and made a department of Colombia in 1886, became independent on Nov. 3 1904, at which time it inherited the boundary controversy with Costa Rica. The Loubet line had not been made effective because of Colombian revolutions. On March 7 1905 Costa Rica and Panama by convention adopted a line interpretative of the Loubet award, but Costa Rica still considered the award unfair to her in respect of the valleys of the tributaries of the Sixaola river above the Yorquin. In fact, the treaty gave to each republic *de facto* right over territory belonging *de jure* to the other. Costa Rica considered, because of interpretations of the Loubet award by Panama, that the treaty of 1905 had lapsed, Panama not having ratified it. Through the good offices of the United States, which was interested in American land claims in the Sixaola region, the two republics agreed in 1910 to submit the Loubet award, which both had accepted, to the interpretation of Chief Justice White of the U.S. Supreme Court. In 1914 he rendered a decision adverse to Panama, and the latter refused to accept it, claiming that it went beyond interpretation, and gave territory not asked for to Costa Rica.

On Feb. 21 1921 Costa Rica forces seized Coto, in Chiriqui province, for the purpose of enforcing the White award, which favoured her there. Panama forces composed of volunteers and police at once moved to recover the territory invaded. Panama on Feb. 24 asked the good offices of the United States to prevent bloodshed. During late Feb. and early March the invasion, moving toward Bocas del Toro, was marked by light engagements and there were anti-American disorders in Panama. On March 5 President Harding requested both nations to cease hostilities and provide for an agreement based on the White award. They acceded, and on March 9 an armistice was announced. Panama had reiterated her dissatisfaction with the White award, and had made representations to the League of Nations denouncing the invasion of her territory by a fellow-member of the League. While withdrawing her military forces from Coto, as Costa Rica had done, Panama announced that she was leaving civil and police forces, and would demand reparation from Costa Rica. The U.S. Government insisted that Panama should acquiesce to the terms of the White award.

(H. I. P.)

**PANAMA CANAL** (see 20.666).—The construction period of the Panama Canal covered about 10 years, but the actual work of

construction was accomplished in about seven years. The first three years were devoted mainly to the task of getting ready to work. During that time the thorough sanitation of the Canal Zone was accomplished, yellow fever was permanently banished, an operating plant was assembled, a working force gathered, living quarters erected and a food supply provided. Reservoirs were built which furnished an ample supply of pure water to the canal force, and to the cities of Colon and Panama, in which water and sewer-systems were built. An out-of-date railway-system was converted into an adequate one with a thoroughly modern equipment of rails, locomotives and cars. The first commission was in office only a year (1904-5) and accomplished little beyond formulating plans and ordering necessary supplies. The second, under the expert direction of John F. Stevens as chief engineer and afterwards as chairman also, reconstructed the railway-system, assembled the operating plant, collected an efficient working force and provided for it quarters, food and all necessary supplies. It also constructed wharves and docks at both terminals, and machine-shops in which the locomotives, cars, steam-shovels and other elements of the operating plant, which were shipped in parts from the United States, were put together. President Roosevelt paid a visit of three days to the Isthmus in Nov. 1906, inspecting the canal works at all points. His visit was notable as the first instance in which an American president had passed out of the U.S. territory while in office. Col. Goethals, of the Engineer Corps of the U.S. army, was appointed chairman and chief engineer of the third commission, on the resignation of Mr. Stevens, and entered upon his duties April 1 1907. This commission was composed of four army engineers, one navy engineer and two civilians. It had been in office only a few months when President Roosevelt, who had from the outset of the work been convinced that the best results could not be attained through an executive body of seven members, issued an executive order placing supreme power in the hands of Col. Goethals, abolishing the commission as an executive body, and making its members, who were heads of departments, subordinate to him. By this order Col. Goethals became the absolute autocrat of the Canal Zone, holding in his hands all civil, military and other powers. For issuing the order President Roosevelt was sharply criticized in Congress, on the ground that he had exceeded the authority conferred upon him by law, but his course was subsequently approved in the Act of 1912 for the government and operation of the canal after its completion.

**Excavation and "Slides."**—Through the power thus given him, Col. Goethals pressed the work of construction forward with such vigour during the five years following the issue of the order that during that period nearly 75% of the entire excavation of the canal was accomplished. The original plans of the canal contemplated a channel with a bottom-width of 200 ft. through the nine m. of the Culebra (afterwards called Gaillard) Cut section and estimated the excavation in the Cut at 54,000,000 cub. yd., and that of the entire canal at 95,000,000 cub. yds. The entire cost of construction, exclusive of \$40,000,000 paid to the French Canal Co., \$10,000,000 paid to the Panama Republic, and the cost of sanitation and civil administration, was placed at about \$190,000,000. The original plans also provided for locks 900 ft. long and 100 ft. wide. In 1906 President Roosevelt increased the length to 1,000 ft. and in 1908 the Canal Commission recommended and President Roosevelt approved changes in the plans which increased the bottom-width of the Cut channel to 300 ft. and the width of the locks to 110 feet. These and other changes increased the estimate of total excavation to nearly 175,000,000 cub. yd. and the estimate of total cost, including payments to the French Canal Co. and to the republic of Panama, to \$375,210,000. In this estimated excavation there was included an allowance of about 8,000,000 cub. yd. for "slides" or breaks in the walls of the Cut. These had been active during the French operations, and had begun to be troublesome to the Americans in the wet season of 1905. In Oct. 1907 a movement occurred which carried about 500,000 cub. yd. into the canal prism, completely filling it and stopping the movement of dirt trains for a month. In Jan. 1913 another movement occurred carrying about 2,500,000 cub. yd. into the prism. One in Feb. 1920 carried in about 2,000,000 cub. yd. more. During the period of construction and subsequently there were about 30 slides of different kinds, covering an area aggregating 220 ac., and compelling an additional excavation of about 30,000,000 cub. yards. Because of this and other developments, revised estimates of the total excavation were made in 1912, 1913 and 1914, the last one placing it at nearly 240,000,000 cub. yd., or about 65-

900,000 more than the amount on which the estimated cost of \$375,210,000 had been based. When the canal was thrown open to commercial traffic on Aug. 14 1914, a total of 224,000,000 cub. yd. had been excavated, and when it was declared formally completed and opened by President Wilson July 12 1920, a total of about 240,000,000 cub. yd. had been excavated and yet the total cost of the canal up to that date was only \$366,650,000, exclusive of expenditures for its military and naval defence. The excavation of slides alone cost about \$10,000,000.

**Gatun Dam.**—The Panama Canal is a huge water bridge rather than a canal, for its surface for the greater part of its length is 85 ft. above sea-level and is held in place by dams at either end. Of these dams the largest and most important is that at Gatun on the Atlantic side. It spans the northern and lower end of a deep valley through which the Chagres river formerly flowed to the sea. It is nearly  $1\frac{1}{2}$  m. long measured on its crest, nearly half a mile wide at the base, about 400 ft. wide at the water surface, about 100 ft. wide at the top; and its crest is at an elevation of 105 ft. above sea-level. It is really two dams in one, for in its centre there is a natural hill of rock about 110 ft. in height. In this the spillway of the dam is constructed, and against its two sides rest the two sections of the great dam. The dam itself contains about 21,000,000 cub. yd. of material. Its outer portions are composed of rock and earth, mainly from the Cut, and its centre or core of material drawn by hydraulic process from pits above and below the dam. This material is a natural mixture of sand and clay which in a watery condition flowed into the interstices of the rock and clay of the structure, making the whole at the centre a rubble-wall firmly cemented together and thoroughly impervious to water. Of the entire length of the dam only 500 ft. are exposed to the maximum waterhead of the lake, which is 85 to 87 feet. In 1919, after an exceptionally light rainfall, the maximum level of the lake was 87-16 ft. in Dec.; and in May 1920, 81-65 feet. The spillway is a concrete-lined channel, 1,200 ft. long and 285 ft. wide, the bottom being 10 ft. above sea-level, sloping to sea-level at the lower end. Across the lake-opening of the channel is a concrete dam in the form of an arc of a circle, making its length 805 ft., although it closes a channel with a width of only 285 feet. The crest of this dam is 69 ft. above sea-level, or 16 ft. below the normal level of the lake. On the crest are 13 concrete piers with their tops 115-5 ft. above sea-level and between these are regulating gates of the Stoney type which move up and down on roller trains in niches in the piers. The gates permit a discharge of water greater than the maximum known discharge of the Chagres river during a flood. Near the N. wall of the spillway is a hydro-electric station capable of generating, through turbines which are supplied with water from the lake through a forebay, sufficient electricity to meet all demands, including the lighting of the canal and all Canal Zone towns and buildings; the machinery of the locks, the machine shops, dry-dock and coal-handling plant; and the telephone and telegraph systems. There is an emergency electric plant at Pedro Miguel, operated by steam.

**Dams on the Pacific Side.**—Dams much smaller than that at Gatun were erected on the Pacific side, one with one lock at Pedro Miguel and one with two locks at Miraflores. In both instances the lock structures themselves form the main portion of the dam. That at Pedro Miguel maintains the level of the water in Gatun Lake and in Culebra Cut, and is placed at the lower or southern end of the channel through the Cut. That at Miraflores holds back the water of a small lake which furnishes the supply of the locks at that point. The Pacific dams are constructed in part like that at Gatun and in part of concrete. That at Miraflores has a small spillway in it.

**The Locks.**—All locks of the canal are in duplicate, are constructed in the same manner, and their chambers, with walls and floors of concrete, have the same usable dimensions—1,000 ft. long and 110 ft. wide. There are six pairs, making 12 in all. The side walls are from 45 to 50 ft. wide at the surface of the floor, are vertical on the chamber side, and narrowed on the outside from a point  $2\frac{1}{4}$  ft. from the floor, by means of a series of steps each 6 ft. long, to a width of 8 ft. at the top. A culvert 254 sq. ft. in area of cross-section, about the area of the Hudson river tunnels of the Pennsylvania railway, extends the entire length of each middle and side wall, and from each of these large culverts, smaller culverts, 33 to 44 sq. ft. in area, extend under the holes in the floors. Fifteen ft. above the top of the culvert in the middle wall there is a space much like the letter U in shape, 19 ft. in width at the bottom and 44 ft. at the top. This space is divided into three storeys or galleries: the lowest for drainage; the middle for wires that carry the electric current to operate the gates and valve machinery installed in the centre wall; and the upper a passage-way for the operators. All lock walls are approximately 31 ft. high, except in the lower pair of locks at Miraflores, where they are 82 ft. to meet the requirements of the extreme tidal oscillation of about 21 ft. in the Bay of Panama. In the walls at Gatun there are about 2,000,000 cub. yd. of concrete, and in those on the Pacific side about 2,400,000 cub. yards. All lock walls rest on rock foundations. The approach wall at the N. entrance at Gatun, 1,031 ft. long, rests upon piles driven from 35 to 70 ft. into the earth; that at the S. or lake entrance, 1,009 ft. long, rests on piles reaching to rock, in some places over 100 ft. below sea-level. Cellular form of reinforced concrete is used in all approach walls except those of the lower locks at Gatun and Miraflores where mass concrete is used because of the effect of salt water on steel reinforcement.

**Lock Gates.**—The lock gates, each composed of two leaves, are 65 ft. wide, from 47 to 82 ft. high, 7 ft. thick and weigh from 300 to 730 tons. There are 92 leaves in all and their combined weight is 60,000 tons. They were carried in parts to the Isthmus and put together there. They are constructed to float like a ship. Each is a huge webbed steel box, the girders of which are covered with a steel sheathing. All portions of the interior are accessible, with watertight compartments providing for the adjustment of the buoyancy so as to control within limits the dead load on the bearings, making the leaf practically float in the water. This watertight compartment is subdivided vertically into three sections, each independently watertight, so that if the shell should be broken in any way, or begin to leak, probably only one section would be affected. An air-shaft, 26 in. in diameter, runs from the bottom compartment up to the top of the gate, and this also is watertight where it passes through the upper half of the leaf. The girders are made with manholes through the webs, providing communication from the top to the bottom of the leaf, and are connected by several sets of vertical transverse diaphragms of solid plates, running from top to bottom of the leaf, thus making a cellular construction, and dividing the spaces between the horizontal girders into small pockets, all of which are accessible through manholes. Each leaf rests at the bottom of its heel-post upon a hemispherical pivot of forged nickel steel, and is hinged at the top to the masonry of the lock wall. It swings free on the pivot like a door, without wheels or other support beneath it. Intermediate gates are used in all except one pair of locks, and are so placed as to divide the space into two chambers, one 600 and the other 400 ft. in length. This makes possible a saving of water and time in locking small vessels through, for about 95% of the vessels navigating the high seas are less than 600 ft. in length. The highest gates and the highest lock walls on the canal are those of the lower locks at Miraflores, and these locks are the only ones which have no intermediate gates. The total lift from mean sea-level to the level of Miraflores lake, 54½ ft., is divided equally between the upper and lower locks. The depth of water on the mitre sills is 40 feet. The locks are filled and emptied through the large and smaller culverts. The large culverts are controlled at points near the gates by large valves, and each of the small culverts feeds in both directions through the laterals, thus permitting the passage of water from one twin lock to another, effecting a saving of water if desired. The average time in filling and emptying a lock is about 15 minutes. The time to pass a vessel through all the locks is about two hours, one hour at each end of the canal. The time of passage of a vessel from ocean to ocean is from 8 to 10 hours, according to the ship's size and speed.

**Passage of Locks.**—No vessel is permitted to enter or pass through the locks under its own power. On arrival at Gatun or Miraflores, it is tied up to the approach wall and turned over to the absolute control of the canal authorities. These place a representative of their own on the bridge and another in the engine-room. They then connect the towing locomotives, or "electric mules," with the ship. These locomotives operate on cog tracks on the lock walls, and proceed at the rate of 2 m. an hour. The number of locomotives varies with the size of the vessel. The usual number required is four: two ahead, one on each wall, imparting motion to the vessel; and two astern, one on each wall, to aid in keeping the vessel in a central position and to bring it to rest when entirely within the lock chamber. They are equipped with a slip drum, towing windlass and hawser, which permit the towing-line to be taken in or paid out without actual motion of the locomotive on the track. The locomotives run on a level, except when in passing from one lock to another they climb heavy grades. Before a lock can be entered, a fender chain, stretched across the walls of the approach, must be passed. If all is proceeding properly, this chain is dropped into its groove to the bottom of the channel. If by any chance the ship is moving too rapidly for safety, the chain remains stretched and the vessel runs against it. The chain, which is operated by hydraulic machinery in the walls, then pays out slowly by automatic release until the vessel is brought to a stop. The chain, which weighs 24,098 lb., and is stronger than any previously made, is capable of stopping a 10,000-ton ship running at 4 m. an hour within 73 ft., or less than the distance between the chain and the first gate. If the vessel by a remote possibility gets away from the towing locomotives and, breaking through the chain, rams the first gate, there is a second gate 50 ft. away, protecting the lock, which is certain to arrest further advance. When the leaves of this gate swing open, the vessel is towed in, and the gate is closed behind it. Then, from openings placed at regular intervals in the lock floor, water pours in, lifting the vessel to the level of the lock above. This inflow, coming equally from all points, does not move the ship from a stable position. The gates are never opened or closed with a head of water on either side of them. The process of lifting is repeated until the vessel reaches the lake level. At all times the vessel is in full view of the men who are controlling it and is as safe as if tied to a wharf. The gates are opened and closed by a powerful machine invented by Edward Schildhauer, an electrical engineer in the employ of the Goethals Canal Commission. It consists of a crank gear or wheel moving through an arc of 197° placed horizontally in the lock wall. To the outer rim of the wheel is attached a strut or connecting-rod which is fastened to the top of a lock gate 17 ft. from the pintle or hinge. When the wheel turns in either direction the gate leaf is opened or shut, the operation taking two minutes.

The crank gear, constructed of cast steel, is 19 ft. 2 in. in diameter and weighs approximately 35,000 pounds. It is connected with an electric motor, and a small electric switch sets it in motion. Every operation in the passage of a vessel through the lock, except the movements of the towing locomotives, is controlled by a single man so placed in a building at the top of the centre wall as to command an unobstructed view of every part of the locks. He has before him a control board table about 64 ft. long and 5½ ft. wide which is a complete model of the locks in duplicate with switches and indicators in the same relative positions the machines they control occupy in the lock walls. Standing by this board the operator throws the electric switches, and in response to his action he sees in the model the fender chains rise and fall, the gates open and close, the water rise and fall in the locks, and knows the exact position of the vessel at every stage of its progress. Each gate, each valve for letting in the water to the culverts, each fender chain, is operated by a separate motor mounted near the machinery in chambers in the lock wall. In each machinery chamber there is a starting panel containing contractors by which current is applied to the motor, and these panels in turn are controlled from a main unit in the central control-house. Some of the machinery chambers at Gatun are 2,700 ft. distant from the point of control, 90% of them are within 2,000 ft., and 50% within 1,200 feet.

**The Canal Voyage.**—The length of the canal from shore-line to shore-line is about 40 m. and from deep water in the Atlantic to deep water in the Pacific about 50 miles. The canal does not, as is generally supposed, cross the Isthmus from E. to W. It runs due S. from its entrance in Limon Bay, through the Gatun locks to a point in the widest portion of Gatun lake, a distance of about 1½ m.; it then turns sharply toward the E. and follows a course generally south-eastern till it reaches the Bay of Panama. Its terminus near Panama is about 2½ m. E. of its terminus near Colon. In passing from the Atlantic to the Pacific a vessel enters the approach channel in Limon Bay, which has a bottom width of 500 ft. and extends to Gatun a distance of seven miles. At Gatun it enters a series of three locks in flight which lift it 85 feet. It then enters upon Gatun lake, the water-bridge of the Isthmus. The lake covers an area of 164 sq. m. with a depth varying from 45 to 87 ft., and contains 183,000,000,000 cub. ft. of water. It has a channel varying from 500 to 1,000 ft. in width, for a distance of about 24 m. to Bas Obispo, where the Cut passage begins. Through the lake a vessel may steam at full speed. The channel through the Cut, a distance of about nine m., has a bottom width of 300 ft. and a depth of 45 ft., and extends to the locks at Pedro Miguel, the Pacific end of the water-bridge. At Pedro Miguel the vessel is lowered in the single lock 30½ ft. to a small lake, at an elevation of 54½ ft. above sea-level, through which the vessel passes, 1½ m. to the two locks at Miraflores. These drop it to sea-level, and through an approach passage 84 m. long, with a bottom width of 500 ft., it passes into the Pacific. The Cut has eight angles and at these the channel is widened sufficiently to allow a 1,000-ft. vessel to make the turn. The smallest angle is 70° 36' and the largest 30°. In the whole canal there are 22 angles, the total curvature being 600° 51'. The sharpest curve is 67° 10'. The canal is lighted from end to end by electricity and gas. There are concrete lighthouses for range lights on the hillsides, and beacons in the Cut, in which electricity is used. The channel through Gatun lake is marked with floating buoys lighted with compressed acetylene dissolved in acetone. The most powerful electric lights are those of the approach channels which are visible for from 12 to 18 nautical miles. The beacons and gas-buoy lights have about 850 candle-power. White lights are used throughout; and in order to eliminate the possibility of confusing the lights with one another, and with the lights on shore, all range-lights, beacons and buoys have individual characteristics, formed by flashes and combinations of flashes of light and dark intervals. The electric lights on the locks are suspended from brackets on concrete columns about 34 ft. high and are clustered under concrete hoods in such a way as to light the lock chambers and not penetrate along the axis of the canal.

**Breakwaters.**—Long breakwaters have been constructed near the approach channels in both oceans. One in Limon Bay, or Colon harbour, called the West Breakwater, extends into the bay from Toro Point at an angle of 42° 53' northward from a base-line drawn from Toro Point to Colon light, and is 11,526 ft. in length, 15 ft. wide at the top and 10 ft. above mean sea-level. A second, also in Limon Bay, known as the East Breakwater, is without land connexion, is about one m. in length and runs in an easterly direction at nearly a right-angle with the canal channel. It has a lighthouse on the channel end. The purpose of the West Breakwater is to protect the harbour against "northerly," very severe gales which are likely to blow from Oct. to January. The purpose of the East Breakwater is to prevent silting in the canal channel. The breakwater at the Pacific entrance extends from Balboa to Naos Is., a distance of about 17,000 ft., or a little more than three miles. It lies from 900 to 2,700 ft. E. of, or for the greater part of the distance nearly parallel to, the axis of the canal prism, varies from 20 to 40 ft. in height above mean sea-level, and is from 50 to 3,000 ft. wide at the top. It was constructed for a twofold purpose: first, to divert cross-currents that would carry soft material from the shallow harbour of Panama into the canal channel; second, to furnish rail connexion between the islands and the mainland.

**Permanent Canal Buildings.**—All permanent canal buildings, for civil or military use, are of concrete, replacing the temporary struc-

tures which were of wood. The headquarters of the canal force are in the large three-storey administration building, situated on a bluff about 75 ft. above sea-level and overlooking the Pacific entrance to the canal. Near this are the governor's residence and the dwellings of the other officials. On the plain below, which was formerly a swamp and was raised to an elevation of 20 ft. above sea-level by material from the Cut and hydraulic fill from excavation for terminal structures at Balboa, there is a town composed of concrete buildings erected after the canal had been completed. The buildings are arranged on either side of a central avenue. They include dwellings for different types of employees, a police station, post-office, fire station, chief sanitary office, dispensary, telephone building, club-house, hotel, lodge hall, schoolhouse and playground, church and commissary. All are of concrete blocks with roofs of red tiles, and of the same general style of architecture, and are connected with one another by a continuous arcade as protection against sun and rain.

**Terminal Facilities.**—In both oceans have been constructed terminal facilities adequate for the naval, military and commercial needs of the United States and attractive to the shipping of the world. Systems of concrete piers 1,000 ft. in length, with docks and wharves and sheds of concrete, have been built. On the Pacific side is a concrete dry-dock on a rock foundation, with a usable length of 1,000 ft. and an entrance width of 110 ft., and a subsidiary dock for vessels of a smaller type with a usable length of 350 ft. and an entrance width of 80 feet. There are also large repair shops of ample capacity to meet all demands. Dry-docks and machine shops are situated behind Sosa Hill and thus protected against naval bombardment. Basins of concrete for the storage of coal have been constructed below the water-line on both oceans, some of which are available for leasing to private coaling companies, all handling to be done by the U.S. Government plant. A fixed supply of coal for the United States naval use is maintained. From a single plant supplies of oil, food and other necessities are furnished to all vessels desiring them, as well as to the canal forces. A high-power wireless telegraph station is situated midway of the Isthmus, under the jurisdiction of the Navy Department, but open to the public under Government regulations.

**Fortifications and Military Occupation.**—The Canal Zone is a military reservation by Act of Congress. Fortifications have been built in the oceans at both ends of the canal, and a military force of about 10,000 men is maintained. Concrete barracks have been erected at both terminals, and adjoining the locks.

**Canal Administration.**—Under an Act of Congress, approved Aug. 24, 1912, the Panama Canal is governed and operated and the Canal Zone is governed through a governor of the Panama Canal, appointed by the president, with the advice and consent of the Senate, for a term of four years, and until his successor shall be appointed and qualified, at a salary of \$10,000 a year. In addition to the operation of the canal, the governor has official control and jurisdiction over the Canal Zone and performs all duties in connexion with its civil government, it being held, treated and governed as an adjunct to the canal. There is one U.S. District Court in the Canal Zone, with the same jurisdiction and procedure as the same courts in the United States, the judge of which is appointed by the president. Appeals are made to the Circuit Court of Appeals of the Fifth Circuit of the United States. In each town there is a magistrate's court, the judges being appointed by the governor. They have jurisdiction only within their towns and over minor cases. General Goethals was the first governor and served till Jan. 11, 1917, when he resigned and was succeeded by Col. Chester Harding, U.S.A., who held the office till Jan. 11, 1921, when he was succeeded by Col. Jay J. Morrow, U.S.A.

**Canal Zone Population.**—A census of the Canal Zone, taken in 1920, showed a total pop. of about 30,000 of which 21,650 were civilians and the remainder military. There were 3,434 male and 360 female American citizens; 5,652 male and 74 female aliens; the remaining 12,000 were mainly natives and transient West Indians.

**Canal Force.**—The average working force of the canal was in 1920 about 21,000, of which about 3,500 were Americans, chiefly in official and clerical positions, and the others alien labourers, mainly West Indian negroes. The apparent discrepancy between these figures and those of the Canal Zone census is due to the fact that many of the labourers live in the cities of Panama and Colon, which are not within the Canal Zone.

**Tolls.**—The Hay-Pauncefote treaty between Great Britain and the United States, abrogating and succeeding the Clayton-Bulwer treaty, was ratified on Dec. 16, 1901. It contained this clause:—

"The canal shall be free and open to the vessels of commerce and of war of all nations observing these rules, on terms of entire equality, so that there shall be no discrimination against any such nation, or its citizens or subjects, in respect of the conditions or charges of traffic or otherwise. Such conditions and charges of traffic shall be just and equitable."

In 1912 Congress passed an Act for the operation and government of the Panama Canal, which was approved by President Taft on Aug. 24 of that year, and which contained the provision that "no tolls shall be levied upon vessels engaged in the coastwise trade of the United States." A formal protest against this exemption was made by Great Britain on the ground that it was a violation of the Hay-Pauncefote treaty. In June 1914, under a special appeal from

President Wilson, Congress passed a bill which repealed the Exemption Act of 1912. This was approved by President Wilson on June 15, 1914. Under authority given to him by the Panama Canal Act of Aug. 24, 1912, President Wilson issued a proclamation on Nov. 21, 1913, fixing the canal tolls at \$1.20 per net ton of net capacity as determined by the United States national rules of measurement. On Feb. 15, 1915 President Wilson issued supplementary instructions that where application of the \$1.20-per-net-ton rate produced a sum in excess of the sum produced by the application of the \$1.25 rate on net registered tonnage as determined by the United States rules of measurement, the excess amount should be uncollectable. The effect of this ruling was to reduce by approximately 14% the revenue from tolls paid by ships of all nationalities using the canal. During the first six years of operation there was a marked increase in traffic through the canal notwithstanding the fact that the World War everywhere prevented the normal development of ocean-going commerce. After the entry of the United States into the war there was a decrease in commercial traffic, due to the diversion of certain lines of ships to trans-Atlantic service, which was more than offset by the increase in traffic growing out of the war, chiefly on account of the development of the nitrate trade with the Pacific coast of South America.

**Canal Traffic.**—The number of commercial transits, the amount received from tolls and other collections, and the current expenses of maintenance and operation for the fiscal years ending June 30, 1915–20 are shown in the following table:—

Fiscal Year	Number of commercial transits	Tolls and other revenues	Current expenses of operation and maintenance
1915 . . .	1,072	\$4,343,383.69	\$4,123,128.09
1916 . . .	760	2,558,542.38	6,909,750.15
1917 . . .	1,806	5,808,398.70	6,788,047.60
1918 . . .	2,068	6,411,843.28	5,920,342.94
1919 . . .	2,028	6,354,016.98	6,112,194.77
1920 . . .	2,478	8,935,871.57	6,548,272.43

For the same period the number of canal transits by government vessels exempted from tolls and the total tonnage of cargo carried were as follows for each fiscal year:—

Fiscal Year	Number of Vessels	Cargo Tons	Fiscal Year	Number of Vessels	Cargo Tons
1915 . . .	16	43,647	1918 . . .	112	36,746
1916 . . .	43	76,675	1919 . . .	179	93,641
1917 . . .	100	147,405	1920 . . .	267	351,332

Over 25% of the cargo handled through the canal, from its opening to the end of the fiscal year 1920, was in transit between the United States and South America, and 14% was between the Atlantic coast of the United States and the Orient. Among nations the chief users of the canal were the United States and Great Britain. The number of vessels passed each year for these nations and for all other nations was as follows:—

Fiscal Year	United States	Great Britain	All other nations
1915 . . .	470	465	153
1916 . . .	238	358	191
1917 . . .	464	780	632
1918 . . .	628	609	803
1919 . . .	786	602	637
1920 . . .	1,129	753	596

The following is the saving, in nautical miles, effected by the Panama Canal from European ports to ports on the W. coast of America, to Hawaii and to New Zealand.

To	From				
	Liverpool	Hamburg	Antwerp	Bordeaux	Gibraltar
Sitka, Alaska . . .	5,666	5,528	5,528	5,376	4,950

**PAN-AMERICAN CONFERENCES** (see 20.671).—The fourth Pan-American Conference was held July 12–Aug. 30 1910 in Buenos Aires. Many questions involving the common interests of all the American republics were discussed, including steamship service, sanitation, copyright, patents and trade marks. It was decided that the International Bureau of the American Republics should henceforth be called the Pan-American Union. The same year the Pan-American Union building in Washington was dedicated; it had been erected through a gift of \$750,000 from Andrew Carnegie and additional funds provided by the various republics. During the three weeks following Dec. 25 1915 the second Pan-American Scientific Congress met in Washington. Eduardo Suarez, Chilean ambassador to the United States, presided. Among the speakers was President Wilson, who urged friendly settlement of international disputes by arbitration. The Congress appointed an International High Commission, which met at Buenos Aires in April 1916. Improvement and extension of cable, telegraph and railway service between the countries was urged. A permanent International High Commission was established to promote uniform commercial laws throughout Pan-America. In Nov. 1918 a Pan-American Federation of Labor Conference met at Laredo, Tex. Delegates were present from the United States, Mexico and Central America. An influenza epidemic interfered with South American attendance, Colombia alone being represented. A permanent federation was organized. Pan-American Child Welfare Congresses met at Montevideo, Uruguay, in Dec. 1918 and in May 1919; at the second meeting provisions were made for establishing at Montevideo an International Bureau of Child Welfare. In June 1919 a Pan-American Commercial Congress was held in Washington, and in the same city in Jan. 1920 a Pan-American Financial Congress.

**PAN-ISLAMISM.**—One of the results of the World War was to bring into new prominence, in connexion with Turkey and the Middle East, the movement known as Pan-Islamism, for uniting the peoples who profess the Mahomedan religion under one banner. The history of Pan-Islamism from 1910 onwards is analyzed below.

1. *Before the Italian War.*—The proclamation of the Ottoman Constitution in 1908 seemed to cut at the root of Pan-Islamism, since the idea of the former was to substitute for preexisting religious and national divisions an Ottoman nationality, wherein the different communities of the empire should equally share. Writers of the year 1909 show many reasons why the "Young Turks" could never favour Pan-Islamism, which indeed they had officially repudiated. It was pointed out that the more conservative Moslem nations of Africa would never approve a Sultan in whose eyes all creeds were to be equal. By 1910 it was realized that this prospect was chimerical; Tal'at Bey, Minister of the

Interior, in a speech delivered at Salonika on Aug. 6 of that year at a private meeting of the Committee of Union and Progress, asserted that, though according to the Constitution all Ottoman subjects were equal before the law, such an order of things was clearly impossible; this equality was in defiance of the *Shari'ah* (religious code), and the Christians themselves had no desire to become Ottomans. At the Salonika Congress of 1911 a definite scheme of Pan-Islamic propaganda was adopted, and it was resolved that a congress of delegates from all the Moslem countries of the world ought to meet annually in Constantinople to discuss questions of interest to all Moslems. Emissaries appear to have been actually sent out during these years to win or to confirm adherents to the Ottoman Caliph wherever Moslems were subject to Europeans, even to remote parts of Africa, including Morocco; others worked among the Moslems of China. These missions seem to have been fairly effective, as a Pan-Islamic writer asserts that the *khutbah* (Friday sermon) continued to be pronounced in the name of the Ottoman Caliph in Tunis in spite of French objection; and that when, in 1912, a republic was proclaimed in China the Chinese Moslems signified their adhesion on condition that the rights of the Ottoman Caliph were not infringed thereby.

Attempts were also made to deal with the old difficulty which had confronted Pan-Islamism, the schism between Sunnah and Shi'ah. Early in 1911 a letter was published by a number of Ottoman and Persian jurists assembled at Nejez, asserting that there was no difference of principle between the two sects and urging coöperation between the two empires, Persia being at that time, it was supposed, menaced by England and Russia. The Agha Khan, head of a sect so heretical that 'Abdul Hamid II. had declined to admit him to an audience, made a tour in India to advocate the claims of a Moslem university. Articles advocating union appeared in various Sunni and Shi'i journals; indeed, the Moslem press as a whole was Pan-Islamic.

Nevertheless, as early as 1910 prominence had been given to a new antithesis, which may be said to have ultimately wrecked the schemes for reunion of the Moslem communities. In that year the Constantinople journal *Iqdam*, an organ of the Committee, adopted a tone unfriendly to the Arabs, whom it charged with readiness to sell their honour for gold—an accusation vehemently resented in the Arabic-speaking countries. But in fact the seeds of dissension between the Turkish and Arab elements in the Ottoman Empire had been sown in the Constitution, in Art. 68, par. 10 of which it is enacted that after the expiration of a period of four years a condition of eligibility to the Chamber of Deputies shall be ability to read and write Turkish. This rule definitely aimed at making Turkish the language of the empire; and in the resolutions in favour of Pan-Islamic propaganda the encouragement of the study of Turkish was recommended. The true Pan-Islamic view was that Arabic should be the common language of Islam; some, indeed, suggested that the empire should be bilingual, with Turkish for its secular and Arabic for its religious language; in any case, that every Moslem should learn Arabic in addition to any idiom which happened to be his mother tongue. Journals were started in the Turkish and Arabic interests respectively; the latter were represented in Constantinople by one called at first *Sirat Mustaqim*, afterwards *Sabil al-Rashad*. The Committee of Union and Progress more and more inclined to the Turkish side and to the substitution of Pan-Turanism for the Ottoman nationality. In the races subject to the Russian Empire and speaking different varieties of Turkish they found their natural allies; and for these the Ottoman literature could count as classical, being in any case far superior to anything of their own. This policy of Turkification involved the Committee in wars in Albania, the Hauran and S. Arabia; they planned treating the Arab parts of the empire as colonies, to be ruled from Constantinople without the right of sending deputies to the Chamber; and they were charged with the design of disarming all Moslems in the empire except the Turks, and with advocating neglect of the ritual of Islam. Where military exercises interfered with religious the latter were to give way; devout officers were, it is said, dismissed and replaced by free-thinkers.

2. *The Italian War.*—To some extent this split was retarded by European aggression, which may be said to have culminated in 1911. The interference of Great Britain and Russia in Persia and the French scheme for governing Morocco as a protectorate had made it clear that Turkey was the only Islamic state which could compete with the European Powers on anything like equal terms. The Italian attack on Tripoli in Sept. of that year evoked widespread sympathy with Turkey among the Islamic communities. The Javanese press, e.g., made no secret of its desire to see Turkey triumph, and the Mahommedan press of Egypt warmly espoused the side of Turkey. At a meeting held in Kabul the Amir of Afghanistan took part in a demonstration in favour of the Turks, and in India money was collected for their assistance. Care, indeed, had been taken by Italy to avoid all appearance of an attack on Islam itself, and the Pope himself warned Christian soldiers against considering the campaign as a crusade; but to the Moslem, Christian and European are not very clearly distinguished, and it was plausibly argued that Europe was not now satisfied with protecting Christians within the Ottoman Empire, but had resolved on partitioning that empire among non-Moslem Powers. In proclamations issued in Constantinople the Sultan whose dominions were thus attacked was described as the legitimate ruler of 300 million Moslems (swelled by some journalist to 400 million), and a demand was raised for the restoration of his arbitrary powers.

Islam was not united on this occasion in the defence of the Ottoman Caliph, for while the Imam of San'a ceased hostilities, the Idrisi chieftain in Asir favoured the Italians. On the other hand, the Turks had the co-operation of the Senussis, who in the preceding century had kept aloof from their quarrels. The Committee of Union and Progress is said to have been astonished at the amount of sympathy which the cause of Turkey had evoked, having expected, e.g., that the Tripolitans would be indifferent to the change of rule, whereas they in fact stubbornly resisted the invaders. The Committee in consequence proceeded to make certain concessions to Arab sentiment, without, it is said, actually altering their policy. A beneficent Islamic society was founded in Constantinople, under the patronage of the heir apparent, chiefly with Egyptian money; and an attempt was made to found a Moslem university in Medina. Schemes were started for promoting the study of Arabic under efficient instructors; and there were authoritative pronouncements that racial differences in the Ottoman Empire need not be suppressed.

3. *The Balkan War and its Consequences.*—This war, which broke out in Oct. 1912, demonstrated the military weakness of Turkey, though the recovery of Adrianople after the Armistice was greeted with telegrams of congratulation from all parts of the Moslem world. Clearly, however, up to this point Pan-Islamism had failed in its original design, that of arresting the progress of European aggression and eventually restoring Islamic rule in Asia and Africa. It had, however, aroused fairly general sympathy with Turkey and perhaps brought home to many Moslems the idea that someone claiming to be their Caliph existed. Subscriptions to the national defence fund of the Ottoman Empire flowed in from various quarters; owing to the efforts of a deputy of the Duma, Tas-pula "Abdul Jalil Ogulu, the Moslems of Samarkand sent a handsome subscription in Aug. 1913; and in Bosnia, which had quite lately formed part of the empire, the opinion was said to be general that the ruin of Turkey would be an immense disaster from the religious point of view. From this region, too, sums of money were sent to the Red Crescent and the national defence fund. In May the Moslems of Delhi sent the sum of £1,600 to the Ottoman Minister of Finance for the housing of immigrants who had lost their homes in the recent war. Subscriptions were also promised from Java and the Malay States. The talk about the need for union between Moslems was renewed in the Moslem press throughout the world; notably in the *Habl al-Matin*, a Pan-Islamic journal in the Persian language published in Calcutta; and societies with the object of either spreading Islam or producing unity among Moslems were founded in different regions; e.g. a *jam'iyyat al-ittifaq*, "Society of Concord," founded in Muscat, a *khariji* state. An *anjuman*-

*islamiya-i-Islam*, "Society for the Defence of Islam," of Auckland, California, is also mentioned.

The language used by journalists caused some apprehension to the European governments responsible for great numbers of Moslems, and complaints were made that in the Islamic territories of Russia the charge of Pan-Islamism was easily leveled and resulted in frustrating the efforts that were being made for spreading education. The Islamic reactionaries, who dreaded the modern learning, obtained the imprisonment of modernist teachers by informing the authorities that the latter were engaged in Pan-Islamic propaganda. Any Moslem who took in the journals of Cairo or Constantinople, or had studied in either of those cities, was suspected of pursuing these schemes. On the other hand, the plan pursued by the imperial government in its scheme for enforced education was the Russification of all its subjects. One member of the Duma, Sadr ad Din Maqsudof, had some years before defended his co-religionists from the charge of Pan-Islamism which the Moslem schemes for education had incurred; while claiming that the Russian Moslems were loyal to the Government, he maintained that their nationality was Islam.

In Syria and Mesopotamia nationalism at this time was developing, and Pan-Islamism making little way.

Two works issued in Constantinople in the year 1913 illustrate the ideas of Moslem publicists on the phase which the question had now assumed.

One of these is the *Ittihad al-Islam* ("Unity of Islam" or "Pan-Islamism") of Jalal Nuri Bey, of sufficient importance to be translated into Arabic in 1920, seven years after its first appearance. In the face of the weakness displayed by Turkey in her last wars it was no longer advisable to demand a general uprising of Islamic peoples to free themselves from European oppression; hence the author, while anticipating yet further defeats and losses, substitutes for a plan of co-operation a vague hope, to which Moslems should cling. This hope is not confined to proceedings in Islamic areas.

He hopes that China and Japan will become cordial friends and so prevent the further spread of European domination in Asia; and thinks that the republican Government of China will be better for the Moslems there than the imperial Government had been. He thinks that the Arabic-speaking people of Africa and Asia will one day form a single state, without indicating what the relation of that state to the Ottoman Empire is to be; the older Pan-Islamism had on the whole favoured "decentralization," i.e., a confederation of Moslem countries under Ottoman hegemony. He advises the English to bestow on their Asiatic possessions the status of Canada or Australia, as in that case the inhabitants will co-operate cordially against their enemies.

In the matter of the sectarian divisions of Islam, which from the first have rendered Pan-Islamism impracticable, this writer's method is to some extent drastic: the minor sects in the Ottoman Empire (i.e. probably the Zeidis, Isma'ilis, Nuseiris, etc.) should be wiped out. In the case of the more important Shi'ah sect his advice is that the Moslem should forget that he is a Sunni or a Shi'i and remember only that he is a Moslem. This probably means that the Shi'is, who are in a minority, should abandon their system in favour of the other.

While asserting the superiority of Islam morally to Christianity as practised in Europe, he is anxious that European science should be adopted and its methods assimilated; and he advises the adoption of the distinction between the civil and the religious code, to the unification of which he attributes the decadence of Islam. Education should, he holds, be taken out of the hands of religious authorities and be secularized; thus mediaeval scholasticism will be abolished. What concerns the conscience should be left to religion, whereas commercial affairs should be regulated by codes which admit of improvement. These doctrines are so unorthodox that his Arabic translator has occasionally to register a protest. They look like Pan-Islamism with the Islam omitted.

This writer repeatedly speaks of the Moslems as a nation of 300 million individuals attached to each other by a bond of unique strength; indeed, the phrase *Union of Islam* is, he thinks, tautologous, as the word Islam of itself implies union. Whatever

may be the truth of this as a theory, it is confirmed neither by ancient nor by modern practice. Some writers, in general favourable to Islam, speak of dissension and civil war as unavoidable in Moslem communities; and doubtless this has led to that loss of political power which gave rise to the Pan-Islamic movement.

The work called *Qaum Jadid* ("The New Nation"), by Ubaid-alla Efendi, formerly member for Aidin, and at one time editor of an anti-Arabian journal in Arabic, which appeared about the same time, perhaps in the main advocated the same ideas, only it was far more outspoken. It demanded that every Moslem should give half his wealth to the Ottoman treasury in order to enable it to muster forces capable of recovering its lost provinces; anyone who declined to make this sacrifice was to be considered an apostate. Its idea of Islam was somewhat loose—there was no occasion to study Arabic, as the Friday sermon might be delivered in Turkish, and the Qur'an and other sacred books might be translated. The Sacred War was a duty incumbent on all Moslems, and such of them as lived contentedly under non-Moslem rulers were apostates, for by pleasing unbelievers they offended God. All Moslems in Ottoman countries who failed to enlist under the banner of the party of Union and Progress were to be regarded as apostates; as such the Albanians were to be branded. To follow the ritual prescribed in the books of the orthodox jurists was unlawful, for the new school had deduced five principles from the Qur'an. These were: 1, reason; 2, the Moslem formula of faith; 3, good character; 4, the duty of fighting with person and wealth; 5, that of striving to furnish the requisites of war by uniting under the banner of the Caliph.

Little could in fact be hoped from attempts to rouse men to make great sacrifices in the cause of Islam when all which constitutes Islam to the ordinary believer is abandoned; and Mr. Wyman Bury, in his acute analysis of the causes which militate against Pan-Islamism, gives the first place to the contempt shown by the Turks for the ordinances which Islam holds sacred. "Even before the war," he says, "Yemen Arabs talked of Turks and Moslems, a distinctly damning discrimination." The Turkish proclivity towards European dress and civilization, which he regards as another source of weakness, is scarcely to be distinguished from this, though the antithesis between civilization and its absence is to be found in other Moslem countries; and the Pan-Islamic encouragement of education as Europeans understand it, while in appearance rendering the movement formidable, has also rendered it suspect to large multitudes who would gladly emulate the ancient Islamic heroes. For the Islamic cult, which is thus so altered as to be unrecognizable, the Pan-Turanians endeavour to substitute a national ideal with a set of heroes, largely pagan, who are to displace the Prophet's family and the Four Pious Caliphs as objects of general reverence. This disrespect is naturally resented by Arab and other non-Turkish Moslems.

The former of the works described is far more characteristic than the latter of the general tone of Pan-Islamic journalism. It is full of accusations against the European Powers in control of Islamic territories, charging them with oppressing the Moslems, depriving them of elementary human rights, sowing dissension among them, and the like; yet rarely able to bring evidence justifying these charges, and compelled to ignore the fact that the Moslems prosper far more in countries protected by Europeans than where they are left to themselves. Its great hero is the Ottoman Sultan Selim I., whose chief title to fame is that he fought against and overthrew another Islamic sultanate, that of Egypt, and forcibly incorporated various Islamic countries in the Ottoman Empire. In places it is asserted that the unity of Islam is an undeniable fact wherewith Europe is confronted; in others, that the troubles of Islam are all due to its divisions. Hence the vagueness of both aim and method which characterized the earlier Pan-Islamism is conspicuous in this statement; and many a prophecy is uttered with regard to the future of European states which the years following its publication have falsified. To the latter work the term Pan-Islamism can scarcely be applied. Its programme is indeed clear enough—a general revolt of all Moslems against their European rulers in order to swell the armies of the Ottomans, the Ottomans meanwhile

practically abandoning Islam. The summing-up of the situation in Arabia by Mr. Wyman Bury in 1914 would hold good of many other Islamic lands: "The Arab still acknowledges the Sultan as Caliph, but repudiates the Ottoman Government and all its works." Some Moslems of Java threatened to abandon the *khutbah* to the Sultan if the ideas of the Turkish extremists materialized. And indeed Pan-Islamism at this stage contained no practical formula which any but Turks would adopt.

4. *Pan-Islamism during the World War (1914-1918).*—Shortly after the Turkish Empire entered the war on the side of the German alliance the Grand Mufti declared a *jihad*, summoning all Moslems to arms in defence of their faith. General Liman von Sanders asserts that this call was absolutely without response; the reason, he holds, being that the pretext was obviously false, inasmuch as Turkey was itself in alliance with non-Moslem Powers and, indeed, fighting for their benefit and under their command. He quotes an Italian minister for the statement that the call was absolutely neglected by the Moslems of Tripoli. Further, the French Government issued a counterblast in a collection of expressions of loyalty from Moslem authorities of the French African Empire (*Collection de la Revue du Monde Musulman*, 1915, 1916, called *Le Salut au Drapeau*, in the English edition *Honour to the Flag*), wherein all Moslems are called upon to fight for France. The call seems to have been issued half-heartedly, even within the Ottoman dominions. When the official at the Mosque of Damascus had to proclaim the Sacred War from its pulpit, seeing a group of German officers among the congregation he said: "I am ordered to proclaim *jihad*. A *jihad* is, as you know, a Holy War to protect our Holy Places against infidels. This being so, what are those infidel pigs doing in our mosque?" This story is told by Mr. Wyman Bury (*Pan-Islam*, 1919, p. 81), who adds: "Those who forged the blade of this counterfeited *jihad* could not temper it in the flame of religious fervour, and it shattered against the shield of religious tolerance and good faith."

Doubtless the most serious blow which the unity of Islam received during the war was the entry into it of the Sherif of Mecca on the British side in 1916. The Sherif in his proclamations (published in his organ, the *Qibla*, and reprinted in the *Manar*, vol. xix.) made it clear that his quarrel was not with the Ottoman Empire, but only with the Party of Union and Progress, who had reproduced the worst atrocities of the *Umayyads* by firing at the House of God and slaughtering worshippers. As, however, this party represented the Ottoman Government, this act produced a definite division in Islam which is unlikely ever to be repaired. Uncertain as the sense to be attached to the title Caliph has ordinarily been, the idea has on the whole prevailed that he should have control of the sanctuaries and the access to them; there seems no means of devising a formula which should combine a Turkish Caliphate with an independent Hejaz. On the other hand, the removal of Turkish rule from Arabia, to which the events which followed the secession of the Hejaz led, has done little or nothing to realize the dream of Jalal Nuri of an empire embracing all the speakers of Arabic. The establishment of the Hejaz kingdom probably on the whole accentuated the sectarian differences which were already rife in the peninsula. A mission was indeed sent by the Emperor of Morocco to the Sherif of Mecca to congratulate him on his assertion of independence; but the legal authority who accompanied it gave it as his opinion that where Islamic countries were at a great distance from each other there was no objection to their being subject to different *Imams*; Morocco had at no time recognized the Eastern Caliphate, in whosesoever possession it happened to be; the independence of the Sherif therefore in no way affected the Moroccan Caliphate. Moreover, the history of Islam attested the frequent coexistence of numerous Caliphs (*Revue du Monde Musulman*, xxxiv., 1917-8, p. 140). The rise of this new power in the sanctuaries was not therefore to furnish a new principle of unity for Islam; it only helped to get rid of that round which the old Pan-Islamic ideas had been grouped.

In lieu of this there is some Pan-Arabian agitation; such at least is the purpose of a violent diatribe reprinted in the *Manar*

for August 1919 from an Arabic newspaper appearing in Brazil called *Suriyyah al-Jadidah* ("New Syria"), for the preceding May, wherein the author urges the Arabs to unite and emulate the exploits of the early heroes of Islam. Apparently he contemplates an Arab federation, to be governed by an assembly which is to meet at one of "the great Arabian cities," with home rule for the separate states. This orator names the Turks with the English and the French among the oppressors of the Arabs, whence his proposed confederation is evidently not intended to include any who are not Arabs by race or adoption; and indeed he traces the servitude of the Arabs to the practice of the Abbasid Caliphs, who relied on Persian and Turkish retainers in lieu of depending on Arab forces exclusively. In addition to this he traces their downfall to the personal ambition of the Arabs, each one of whom aspires to be chief. Probably this is in the main intended as anti-French propaganda; but it would seem that quite early in the war some persons had aimed at establishing a union between the various states in Arabia itself, to be extended into the neighbouring countries with a view to resist the enforced Turkification with which they were threatened. It failed to materialize because the Sherif of Mecca had reasons for refusing to join it, and the course of the war by no means tended to allay divisions between the states of Arabia; indeed, in July 1918 the King of the Hejaz issued a proclamation declaring the Wahabis infidels and urging his subjects to resist them with force. This conflict "wounded the heart of every Arab who desired the unity of his race and every Moslem who disliked discord between his co-religionists."

The attempts that have been made during these years in other Islamic countries to propagate the idea of a Moslem union seem to have been ordinarily similar to those which preceded the Ottoman Constitution. They consist largely in the encouragement of education, and the founding of societies and journals whose purpose is to keep the Moslems together, and to maintain some sort of relations with their co-religionists in other parts of the world. Certain countries, indeed, appear to have been outside the reach of such efforts; and there are some wherein if attempted they have been unsuccessful. The general result of the war would seem to be to show that the Pan-Islamic idea was doomed to disappointment from the first. The European Powers against whom it was directed—England, France, Russia and afterwards Italy—received during the course of it great proofs of loyalty and attachment from their Moslem subjects; and even if we do not take every protestation at its face value, it seems clear that there was little sense of unity with the Turks on the ground of common religion on the part of these populations, in which, on the contrary, the sense of patriotism to the empires within which they are incorporated had been developed. The proclamation of a *jihad* with no response shows that the time for the employment of that instrument has passed, if indeed it was ever effective; the insertion of the Ottoman Sultan's name in the *khutbah* of so many peoples, to whom he was unknown, no more made him their real ruler in this century than that of an Abbasid in the 10th or 15th century secured for the Caliph any real power. Possibly the call attracted attention to the nature of and qualifications for the Caliphate, a subject which the Ottomans were imprudent in bringing to the forefront.

This is not, indeed, the view of some Moslems in India, who have established an *All-India Caliphate Committee*, with a series of publications on the *Question of the Caliphate*. The first of this series contains the presidential address of "Maulana Abul-Kalam," purporting to have been delivered at the provincial Caliphate Conference held in Calcutta Feb. 28 and 29, 1920. This treatise presents the most bellicose aspect of Pan-Islamism, and differs little from the *Quam Jadid* described above. The *jihad*, according to it, is the primary duty of the Moslem; if the Turks are apt to be lax in their ritual, it must be remembered that for centuries they alone maintained the *jihad*, at a time when the Indian Moslems were enjoying peace and security. An endeavour is made to show that ever since the time of Sultan Selim I. the Caliphate of the Ottoman Sultan has been generally recognized. It is argued that there can be only one Caliph, and that

it is the duty of every Moslem to be his obedient subject; and in particular to aid him in repelling invasions by unbelievers of Islamic territory and expelling them where they are already in possession; Islamic territory would appear to include the whole inhabited world. At the least the author claims that Arabia, Palestine and Iraq are the property of the Ottoman Sultan, which must be restored to him if the sentiments of the Moslems are not to be wounded. The Indian Caliphate Delegation sent to London went so far as to demand the cession of all the European lands which the Ottomans had ever occupied.

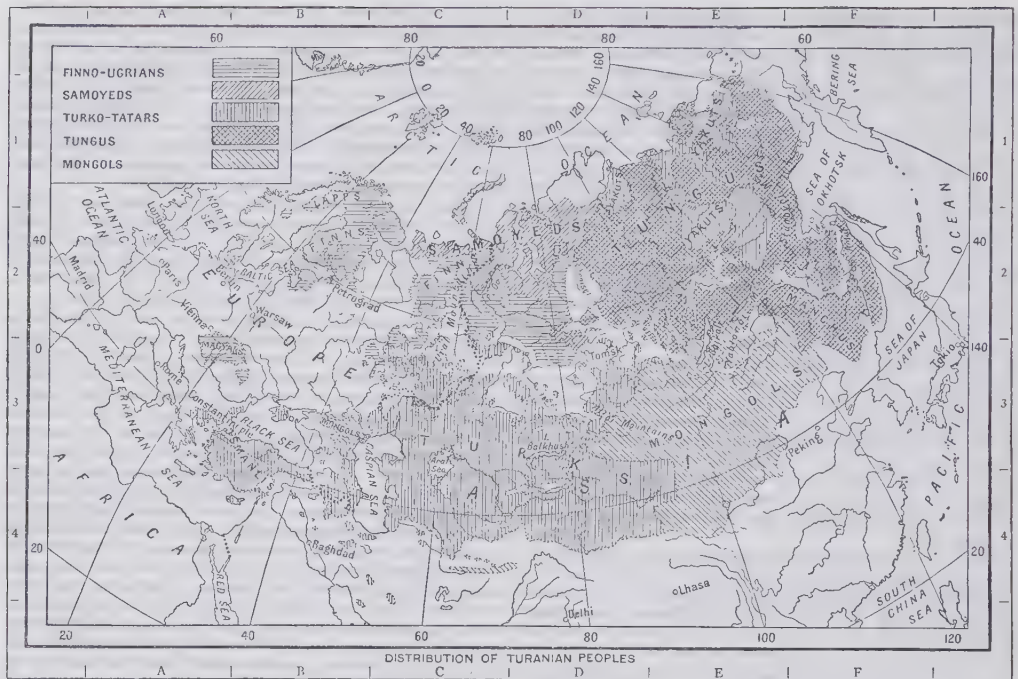

Ideas of this sort—not always carried to these lengths—are expressed by various authors and journalists in India, few of whose names are known in Europe. The best known of those who are claimed as advocates of them is probably the poet and philosopher Mohammed Iqbal, M.A., Ph.D. See this writer's *Secrets of the Self*, transl. R. A. Nicholson, London, 1920.

5. *After the War.* To what extent we can speak of Pan-Islamism since the Armistice is not clear. On the one hand it is evident that the occupation of Constantinople by foreign forces and the reduction of the Ottoman Empire to a comparatively small area have produced a feeling of depression among the Islamic peoples, who can no longer look with confidence to a great Islamic Power as the natural leader in some scheme for the recovery of hegemony in Asia and Africa; on the other hand, the feud between Sunnah and Shi'ah shows no signs of healing, and though an Arabian Caliphate may not yet have been formally proclaimed, the severance of the Arabs from the Turks appears to have been definitely concluded. Even within the Ottoman system there is at this moment a schism, since the authority in power at Angora acts independently of the Caliph of Constantinople, and appears to rely on Turanian support, so far as it obtains any from Islamic peoples; while its endeavour to obtain support from Bolshevism is calculated to wound the sentiment of orthodox Islam, which is far removed from the principles of that system. Further, it would appear that the tendency of recent events has been to emphasize nationalism, and create a desire in the various Arabic-speaking countries for complete independence rather than for absorption in an Islamic empire, even on the condition of decentralization, which was the catchword of the old Pan-Islamism. A Pan-Islamic tendency may perhaps be found in the Indian Caliphate agitation, but, even if it be taken at its face value, it is clear that it is making demands for the Ottoman Caliph which his former subjects do not back, and many who have made sacrifices for this idea have found no encouragement from Islamic rulers who at one time were supposed to recognize this title.

Conjectures are indeed at times put forward concerning the existence of agencies organizing simultaneous outbreaks in different Islamic countries against their European protectors; such may certainly exist, but the results hitherto achieved indicate little in the way of coöperation or clearness of aim; and indeed 'Abdul Hamid II., who gave some encouragement to the Pan-Islamic idea, which was that Turkey should lead a *jihad* against the European possessors of Islamic countries, does not appear himself to have entertained such a project, though he thought the fear of it might help him in checking European interference with his internal government. The governments which have followed have probably hoped for greater results, but have obtained very much less, being unable either to maintain the independence of Moslem states outside their empire or to preserve the integrity of that empire itself. It would seem then that Pan-Islamism, should it again acquire importance, must seek some other *point d'appui* than the Ottoman Empire; but only the future can tell whether such a *point d'appui* will be found.

**PAN-TURANIANISM.**—Only a few years before the outbreak of the World War in 1914, a new political movement came into prominence in Constantinople. The awakening of a Turkish national consciousness began to aim at the purification of the

Turkish language by the expulsion of all foreign elements, especially Persian and Arabic, and the establishment of a civilization based entirely on old Turkish traditions. In this movement Ziya Bey, Shinassi Bey, and Namik Kemal Bey were particularly active. The researches of the Academy of Turkish Science, established after the Young Turk revolution, dealing with the original home and the pre-Mahommedan history of the Turks, were then artificially utilized greatly to widen the scope of the Turkish national movement. The goal was now the formation of a powerful and independent union of all the peoples of the world kindred to the Osmanli Turks and alleged to embrace a population of 50,000,000 (about double the actual number of those speaking Turkish dialects). For the national designation "Turk" was now to be substituted the more comprehensive "Turanian," and the Mahommedan crescent was to be abandoned for the pre-Mahommedan Turkish wolf as a racial emblem. Turkish writers began to speak of their ideal fatherland, their Turania, the cradle of their nation, and the home of their race. The poet Ziya Gök Alp, called by a countryman "the great Apostle of Turanianism," celebrates Attila, Jenghiz and Oghuz Khan as heroic figures that stand for the proud fame of his race, and describes the fatherland of the Turks not as Turkey or Turkestan, but as the "broad eternal land of Turania." This wider movement involves a policy of Irredentism which aspires not only to stimulate by moral and intellectual propaganda a feeling of racial unity among the kindred peoples, but under favourable circumstances to free those peoples from foreign rule. Curiously enough, the circumstances since the conclusion of the war seem to be more favourable to the realization of this ideal than they were before its outbreak. It is an ideal that is not likely to disappear, for its fulfilment is the only remaining prospect for Turkey of expansion as compensation for the great territorial losses that empire has sustained in recent times.

It now becomes necessary to inquire what possibilities this somewhat vague term Pan-Turanianism implies. The earliest form of the name "Turanian" occurs perhaps about 800 B.C. in

the *Avesta*, the sacred book of Zoroastrianism, as *Tura*, to designate a country which was contiguous to Iran (Persia) and the inhabitants of which were in constant conflict with the Iranians. It is met with again about A.D. 1000 in the *Shahname* or Book of Kings, of the Persian poet Firdusi as Turān, the country beyond the Oxus (now the Amu Darya). Persian sources show that the ancient Turan (Turania) corresponded roughly to the Russian Turkestan of to-day. In the second half of the 19th century "Turanian" came to be used as a loose designation of Asiatic languages that were neither Aryan nor Semitic, and to be similarly applied in a racial sense to the nomadic peoples speaking those languages, as opposed to the agricultural Aryans. The term has more recently become synonymous with "Altaic" or "Ural-Altaic." "Turanian" is here treated in this definite sense.

Having spread in prehistoric times from the Altai mountains in the centre of Asia, this ethnic family at the present day occupies a broad belt of territory extending from Thrace across Asia to the sea of Japan and reaching from about 35° N. lat. to the coast of the Arctic Ocean. It consists of five main branches, the Samoyeds, the Finno-Ugrians and the Tunguses constituting the northern, and the Mongols and the Turks the southern division. The countries inhabited by the Turanians are Siberia, Mongolia, Manchuria, Chinese and Russian Turkestan, Asia Minor, parts of Persia and Afghanistan, the Caucasus, the Crimea, the Volga and Pechora regions of eastern Russia, Lapland, Finland, Hungary, and portions of the Balkans.

Down to the outbreak of the World War all the Turanian peoples were subject to foreign (Russian, Chinese, Persian, Afghan) domination except the Magyars and the Osmanli Turks. Only those sections of the Turanians that have come into close contact with the Aryans of Europe have succeeded in rising from their primitive state to a comparatively advanced degree of civilization: the Finns, the Magyars and the Osmanli Turks.

The Turanians in Europe number in round figures 22,000,000: 10,000,000 Magyars; 6,000,000 Samoyeds and Finns; and 6,000,000 Turks. In Asia there are 26,000,000: 115,000 Finns, Samo-

yeds, and Tunguses, all in Siberia; 6,000,000 Manchus, Mongols and Turks, all until recently under Chinese rule; 8,200,000 Turks in Asiatic Russia; 3,500,000 in Persia and Afghanistan; and 8,000,000 Osmanli Turks in Asia Minor. The Turks in Russia are usually called Tatars, and those elsewhere outside the Turkish Empire, Turco-Tatars. Their language is the most characteristic feature of the Turanians. As contrasted with the highly inflexional Indo-European and Semitic linguistic families on the one hand, and the monosyllabic Chinese on the other, the Turanian languages are typical examples of the agglutinative form of speech. Here unchangeable roots are combined with suffixes by means of what is called progressive vowel harmony, in such a way that the vowels of the endings are assimilated to that of the root. Thus the infinitive element *mak*, which appears in Osmanli Turkish *yaz-mak*, "to write," becomes *mek* in *sev-mek*, "to love."

The Mongolians best represent the Turanian physical type. They have broad faces, small, slanting eyes, high cheek-bones, broad, flat noses, thick lips and low foreheads: their complexion is yellowish brown, their hair straight, and their beards scanty. The various branches of the Turanians have intermingled to a considerable extent, but it was only on their western confines that they mixed much with aliens, especially Slavs. Thus many Finnish tribes have been absorbed by the surrounding Russians: the Magyars and the Osmanli Turks, though they have retained their Turanian speech, have lost most of their physical Turanian characteristics; while the Volga Bulgars have no trace of their original Turanian language and physique left, their name alone having survived among the Bulgarians of to-day.

The primitive religion of the Turanians is called Shamanism because its distinctive feature is the agency of the Shaman, a wizard priest, whose services are required to influence the supernatural powers. Witchcraft predominates in this religion, it being the function of the Shaman to master all that in nature is hostile to man, to curb the elements, to conjure spirits, to produce health or disease, fortune or misfortune. The Shamanist operates mainly against demons, but he also believes in higher gods, whom he calls to his aid by means of prayer and sacrifice. Ancestor worship is, moreover, a characteristic feature of Shamanism. An important instrument in the rites of the Shaman is the drum, by means of which he can summon spirits, and compel them to give active assistance. Shamanism is still found in all the Asiatic branches of the Turanian family. But it is only general among the Tunguses, all the tribes of whom (except the Manchus) are devoted to their old faith. The Samoyeds, too, are still largely Shamanists. Among the Mongols, the Buryats on Lake Baikal are the only tribe in which Shamanism prevails. Among the Turks, the old religion survives only in the tribes that remained behind in the Altai range. From the rest of the Turkish peoples it has been extirpated by Islam, though single tribes of Turkish nomads show clear traces of their original beliefs. On the other hand, the Magyars and the Finns adopted Christianity many centuries ago.

The very primitive stage of civilization which the Turanians had attained when they first appear in history, has remained on much the same level, with the few exceptions caused by European contact, down to the present day. As the cultivable soil of the ancient world had already been occupied by the Chinese, the Aryans and the Semites, the Turanians, when driven by the expansion of population to migrate from their ancient homes in the Altai mountains, were compelled to wander in barren steppes in order to maintain themselves. Their civilization thus acquired the stamp of nomadism, in which the isolation of small communities caused by their mode of life prevented the patriarchal system of government from advancing to any higher stage of political organization. The struggle for existence naturally brought them constantly into predatory conflict with their settled and more prosperous neighbours, while boundary disputes tended to perpetual internal strife. The unsettled habits thus produced have, since the adoption of Islam by the Turkish branch, made that branch for many centuries the main cause of unrest in the history of the world, because the directing force of fanaticism has been added to their unorganized restlessness.

The above account of the various branches of the Turanians will supply the material on the basis of which the prospects of Pan-Turanianism may be judged. The movement in its wider aspect having in the years preceding the war been the product of the German-educated *Intelligentsia* of Constantinople, was, after Turkey joined the Central Powers, much used in support of the alliance between Turkey and Hungary on the strength of racial kinship, and as a lure for the Tatars of the Russian Empire. In the summer of 1918, Halil Pasha, an uncle of Enver Pasha, had an interview, reported in a Berlin journal in 1920, with a German commanding officer in Anatolia, to whom he expounded the aims of the Pan-Turanian movement. Placing the national policy in the foreground, he said it was necessary to unite all Turkish-speaking peoples. The beginning must be made with the conquest of Turkestan, the cradle of the Turkish Empire. The next step would be to establish a connexion with the Siberian Yakuts, the farthest outpost of the Turkish Turanians in the north-east of Asia. After that, the Tatars of the Caucasus were to be included. This nationally exclusive Turkish Empire must, he continued, as a Mahomedan supreme power, have a great attraction for the Turks of Afghanistan and Persia. The incorporation of Azerbaidjân, the richest Persian province, might thus be hoped for in the near future. When, on the conclusion of the war, Constantinople had been occupied by the Entente Powers, Halil Pasha was thrown into prison there by them, but, managing to escape, he continued his activities in favour of a Pan-Turkish Empire. Enver Pasha had previously been emphasizing the Pan-Islamic policy and been using Arabs as Turcophil propagandists in the Caucasus. The general plan of this double procedure was by fusing the religious movement of Pan-Islamism with the racial movement of Pan-Turanianism to establish a great Turkish Empire, with Constantinople as the centre of both.

Pan-Turanianism, from the point of view of practical politicians, does not go beyond the ideal of a Turkish Empire comprising all the divisions of the Turkish race, the numbers of which do not really exceed about 26,000,000. As the Ottoman Empire contains no more than 10,000,000 Turks within its present limits, the Irredentism of the Pan-Turanian movement embraces a population of 16,000,000. Before the war, 12,000,000 of these were under Russian and 4,000,000 under Chinese, Persian and Afghan rule. At that period Russia could scarcely be regarded as a very promising field for Pan-Turanian propaganda; for generally speaking the Russian Mahomedans had been loyal, conservative, and somewhat narrow in their political outlook. Had Russia emerged intact from the conflict, her Turkish territory could have been wrested from her only at the price of another war, which the Ottoman Empire would hardly have been willing to face. But the whole situation has been transformed by the Russian Revolution and the consequent break-up of Russia. The Irredentist ambitions of Pan-Turanianism have now been brought appreciably nearer the possibility of realization. A warmer sympathy has been developed among the Russian Mahomedans with the Mahomedans abroad. Russian Turkestan and the two Khanates of Khiva and Bukhara have asserted their independence; the Tatars of the Caucasus have become republics. These new conditions might render the voluntary incorporation of all these outside Turkish populations in the Ottoman Empire not unlikely. For the important unifying elements of general identity of language, religion, and civilization, besides contiguity of territory, are all present. The speech of the Turkish branch of the Turanians has changed so comparatively little that all the divisions may be said to speak one single language, Turkish, differing only to the extent of dialects. Islam is the religion of all the divisions of the Turkish branch, which, though it only adopted this religion, has been its main protagonist. The Turkish-speaking peoples, again, have a common civilization which, based on their primitive nomadism, has as its superstructure the ethics and the culture of the Koran. Finally, with the exception of the Yakuts in the north-east of Siberia, the Turkish peoples are practically in continuous geographical contact from Thrace eastward to the frontier of Mongolia and northward into south-eastern Russia. The connexion of eastern Asia Minor, by way of the Caucasus

with Central Asia, which was closed by Tsarist Russia, is now open for the union of the Turks. This road to the East is of great importance both on political and economic grounds.

If the spirit of independence among the Turks of Central Asia, the Caucasus, and Azerbaidjan could be overcome by the unifying power of common language, race, religion, and culture, Turkey might become a formidable political power based on the combined moral force of the Caliphate and of Turkish nationalism.

Pan-Turanianism, however, if pushed to extremes, is an artificial and a retrograde movement, and would then come into irreconcilable conflict with Pan-Islamism. Thus the attempt to carry out the proposal of some of the Turks of Constantinople to renounce the religion of Mahomet, or even to substitute Turkish for the sacred language of the Koran, would incense the fanatical Moslem. Again, the Turkish peoples outside the Ottoman Empire do not form coherent populations, containing as they do large nomadic elements. On the other hand, the Ottoman Turks, indolent by nature, have never displayed any ability or energy in state-building. It is therefore not likely that they will develop enough statecraft and driving-power to succeed in welding together the different Turkish peoples into a single strong united empire containing perhaps 25,000,000 of the Turkish race. The extension of Pan-Turanism so as to include other branches of the Turanians can only be pronounced to be a purely visionary idea. The only connecting link between them and the Turks at the present day is the descent of their various languages from a single parent speech that existed in remote antiquity; but Lapp and Manchu are to-day farther apart than English and Sanskrit. The other four branches now differ from the Turks in religion and civilization, besides being separated from them by great and often immense distances. The Samoyeds are nominally Christians, but really Shamanists. The Tunguses, who inhabit a vast tract of north-eastern Asia as Shamanists and reindeer nomads, are slowly dying-out in Siberia while their most prominent tribe, the Manchus, are being entirely absorbed by Chinese civilization. The Mongols, who are the eastern neighbours of Turkish tribes, and were many centuries ago politically associated with the Turks as warlike invaders of the West, are nomads and for the most part adherents of Buddhism, which has transformed them into a peaceful and unenterprising people that at the present day has hardly anything in common with the Turks. The Finno-Ugrian branch, for the most part separated by long distances from the Turks, have with very slight exceptions been thoroughly Europeanized and Christianized for many centuries. The Magyars, conquered by the Turks in the 16th and 17th centuries, fought on the side of the Turks during the World War owing to the pressure of the German alliance; but there seems to be no permanent prospect of political association between these two racially and linguistically related races. It thus seems clear that at least 20,000,000 Turanians will never have the slightest inherent tendency to be drawn into union with the Islamic religion and civilization of the Turkish Empire.

(A. A. M.)

**PARAGUAY** (see 20.756).—The pop. of Paraguay in 1920 was supposed to be about 800,000. At least 60% of the inhabitants were illiterate, though President Franco during 1916-9 made an attempt toward educational progress. The school registration for 1916 was 80,142.

Of the imports of Paraguay 81%, and of the exports 40%, pass through the Asunción custom-house. The total foreign trade of Paraguay varied little between 1907 and 1918 though the proportion of imports to exports differed, as will be seen from the following table, showing the official customs values in Paraguayan gold pesos, equal to 4s. or 50.96 each:—

	Imports	Exports	Total
1907	7,512,502	3,236,110	10,748,612
1917	5,098,581	6,494,802	11,593,383
1918	5,201,726	7,171,319	12,373,045

The United Kingdom had first place in imports until 1908, when Germany passed her, supplying 29% of the total imports as against Great Britain's 21 per cent. A close competition followed. In 1913 the United Kingdom supplied 28.6% of Paraguay's imports as compared with 27.6% from Germany, but in 1914 the situation was reversed, Germany supplying 27% to the United Kingdom's 22.7 per cent. In 1915 and 1916 the proportion of imports from the United Kingdom rose to 33% and 38.5% respectively. There was in 1921 only one strictly British mercantile house, and only one American, as compared with five German houses.

**History.**—Manuel Gondra became President on Jan. 18 1911 but was overthrown by a revolution headed by Col. Albino Jara in July of that year. Jara was succeeded in turn by Liberato Rojas, who was overthrown Jan. 14 1912 by another "alteration of the legal order," as a consequence of which Pedro Pena was placed in the presidential chair Feb. 29. Considerable bloodshed accompanied these changes, which cost the country at least £400,000. On March 25 Emiliano González Navero became President, retaining office until Aug. 15, when Eduardo Scherer succeeded him. Scherer actually completed his term of office, the first time this had occurred in Paraguay since 1870. His firmness prevented several outbreaks and disturbances, especially one at the beginning of 1915, which might have been most serious under a weaker executive. Scherer's successor was fortunately another able man, Manuel Franco, who retained his position from Aug. 15 1916 until his death on June 3 1919. Franco not merely forestalled revolutions, but brought Paraguayan finance to the best condition it had reached for years. During his administration the meat-packing industry became fully established in Paraguay. This was the greatest step forward that had occurred since 1870. By encouraging an industry which more than almost any other improves the lot of the individual farmer in a rather isolated agricultural country, the three United States packing-houses that established themselves in Paraguay during President Franco's administration were of great service. They caused a thorough survey of Paraguay's cattle-raising possibilities to be made and also studied the different grasses and areas of pasturage and their suitability for different breeds of cattle. In 1918 37% of the total exports of Paraguay consisted of the products of stock-raising and meat-packing as against 32.4% for the products of the forest industries (lumber, quebracho, etc.) and 30.2% for agricultural products.

José P. Montero filled the remainder of Franco's presidential term, from June 3 1919 to Aug. 15 1920, when Manuel Gondra again became President, having been elected while minister to the United States. The lessened demand from Europe and the United States for the chief exports of Paraguay at the close of the World War caused a decided setback to Paraguay's prosperity. On Jan. 1 1921 Paraguay was unable to meet the payments due on her foreign debts, and the largest banks in the country became seriously involved, further aggravating the commercial crisis. An American financial adviser was assisting the Paraguayan Government in 1921. On Nov. 17 1913 through rail communication was inaugurated between Asunción and Buenos Aires. This has done much to lessen the isolation of the country, for under normal conditions the journey between the two cities is made in 50 hours. Paraguay renewed direct diplomatic relations with the United States in 1913, sending a minister to Washington for the first time in eight years, while the United States created a separate mission for Paraguay in the same year, accrediting a minister to Paraguay alone, instead of to Uruguay and Paraguay jointly as formerly. Great Britain in 1921 still accredited one minister to both countries. The United States and Paraguay signed an extradition treaty on July 30 1913. In Nov. 1921, Pres. Gondra was ejected from office as the result of a revolution.

The Government remained neutral during the World War, though Congress adopted a resolution of sympathy with the Allies and of approval of the action of the United States in declaring war on Germany. The Government dismissed some of its German employees, and maintained a pro-Ally attitude.

The best recent book on Paraguay is 'W. L. Schurz, *Paraguay, a Commercial Handbook*, published by the Government Printing Office at Washington, D.C., 1920. (C. L. C.)

**PARAVANE**, a naval device used in the World War first for attacking submerged submarines and subsequently for protecting vessels against mines and for cutting up hostile minefields. The name of Acting-Comm. C. D. Burney is especially associated with its design and development.

The explosive paravane in its final form consisted of a torpedo-shaped body carrying near its head a large steel plane which was set at a small angle to the centre-line of the body, and was in an approximately vertical position when the paravane was being towed. The thrust of the water on the plane carried the paravane away from the towing vessel, and with two paravanes, one on each side, a spread of sweep of about 200 ft. was obtained, *i.e.* the two paravanes were that distance apart. Horizontal and vertical fins near the tail increased the stability, and in the tail was fitted a depth-keeping mechanism consisting of a horizontal rudder actuated by a hydrostatic valve which responded to any difference in the water-pressure caused by a change of depth. The paravane carried a heavy charge of high explosive which could be detonated, by means of an electric current passing through the core of the towing-wire, in any one of three ways. If the paravane hit the hull of a submarine, striking-gear on its nose operated a switch which closed the firing circuit. This impact method would not become operative should the towing-line become entangled in the external fittings of a submarine, but in that case an extra load would be put on the line; apparatus was therefore provided such that when the load on the line exceeded a predetermined value a switch was tripped and the circuit closed. Finally a hand-switch on the bridge of the towing vessel enabled the charge to be detonated at will should the presence of a submarine be suspected.

It was soon seen that the explosive paravane could be adapted to protect vessels against moored mines. For this purpose the towing-lines were attached, not at the stern as with the explosive paravanes, but at a point as far forward and as low down as possible. Their outboard ends being kept about 100 ft. away from the central fore and aft line of the ship by the paravanes to which they were attached, they swept a wedge-shaped track in a horizontal plane at the level of the keel or slightly below it, and fouled the mooring-wires of any anchored mines lying in or near the course of the vessel. When this happened the mooring-wire was deflected along the towing-line until it reached the head of the paravane, where it was guided into the jaws of shears or scissors made of special high-grade steel, by which it was severed. The mine then floated to the surface and was exploded by rifle-fire. It was found that with a pull of about 7 cwt. the shears would cut a  $\frac{1}{2}$  in. mooring-wire. The normal length of the towing-lines was 56 yd.; three-strand wire ropes were used, each consisting of 37 galvanized wires, 0.049 in. in diameter, with an ultimate breaking strength of between 100 and 120 tons per sq. in. There were three types of protector paravanes: (1) The merchant-vessel type, known as "otters," for ships with speeds below 16 knots; (2) the fast-liner type; and (3) the battleship type.

The mine-sweeping paravanes were towed from the stern of high-speed destroyers. As the point of attachment had to be on deck, an arrangement called a "depressor" was used to bring the virtual point of tow down to the required depth at the stern. Wide paths could be swept at speeds of 26 to 30 knots.

**PARDO BAZAN, EMILIA** (1851-1921), Spanish author (*see* 20.800), died in May 1921.

**PARIS** (*see* 20.804).—The population of the French capital, —2,847,229 at the census of 1911,—was 2,906,472 at the census of 1921. In view of the rapid German advance on Paris after the outbreak of war in August 1914, steps were quietly taken to evacuate as many as possible of the civilian population; and on the night of Sept. 2 the President and ministers left the city for Bordeaux, where the Government was temporarily transferred. But the victory of the Marne removed the peril from Paris, and in December the Government returned there.

Paris during the World War was bombarded by aeroplane, Zeppelin, and artillery; 746 bombs were dropped from the air, killing 266 persons and wounding 603; German long-range artillery fired 303 shells into Paris, killing 256 persons and wound-

ing 620. The first air raid was made on Aug. 30 1914, by aeroplane and in daylight. The first Zeppelin raid took place by night on March 21 1915. The worst air raid was made on the night of Jan. 30-31 1918, when 91 bombs fell upon the city itself and 178 on the suburbs. The long-range bombardment began on March 23 1918, and continued until Aug. 9, with many intervals of calm, there being only 44 days upon which the Berthas were active. The existence of such long-range artillery being unknown when the first shells fell at an early hour of the morning, it was imagined that German aircraft, hidden high behind the clouds, must be engaged. All work in the city was at a standstill until noon, when the regularity with which the projectiles exploded at intervals of about 20 minutes, and an examination of some of their fragments, showed that a new engine of war was at work. The first two days of bombardment were the heaviest from the point of view of the number of shells fired, but from the number of casualties caused. March 29, when only one shell fell in Paris, was the most costly. That one shell fell during Good Friday service on the church of St. Gervais, bringing down with it a large portion of the roof; 88 people were killed and 68 wounded.

The air defences of Paris were not properly organized until March 1918. In fact organization had not been necessary, as German air services concentrated all their bombing raids upon England during the years 1916-8. The results obtained by the Paris system of air defences were as follows: on 13 different occasions, on which 107 aeroplanes all-told were employed, no single raider was able to reach Paris; of the 483 planes sent by the enemy to Paris in 1918, only 37 reached the city, and 13 were brought down; and only 11,680 kgm. of bombs were thrown upon the city.

The war being over, the work of demolishing the fortifications encircling the city was begun in 1919, in accordance with a grandiose scheme which would give Paris another ring of boulevards nearly 30 m. in length. It was intended that some of the ground thus made available should be used for building purposes, in the hope of solving the acute housing problem. It was proposed to keep much of it as garden, and to build numbers of well-equipped playing-grounds, and air stations round the city. One portion of the available space, S. of the city, was to be set apart for "University City," where accommodation would be provided for students of all nationalities; to include recreation and sports grounds, swimming-baths, etc. The site chosen is near the Parc Montsouris.

**PARKER, ALTON BROOKS** (1832— ), American lawyer, was born at Cortland, N.Y., May 14 1852. He studied at the local academy and normal school, taught for a short time, read law in an office, and in 1873 graduated from the Albany Law School. He was admitted to the bar and began to practise law at Kingston, N.Y. In 1877 he was elected surrogate of Ulster co., and was reelected in 1883. He resigned in 1885 on being appointed by the governor justice of the N.Y. Supreme Court to fill a vacancy, and the following year was regularly elected. He was a delegate to the Democratic National Convention in 1884 and in 1885 declined President Cleveland's offer of the first assistant postmaster-generalship. He was appointed a member of the second division of the N.Y. Court of Appeals in 1889 and a member of the general term in 1893. In 1898 he was elected chief justice of the N.Y. Court of Appeals. In 1904 he resigned on being nominated by the Democrats for president, but he was defeated by Theodore Roosevelt, the electoral vote being 336 for Roosevelt to 140 for Parker, the popular vote 7,623,486 for Roosevelt to 5,077,971 for Parker. He then resumed the practice of law in New York City. He was a delegate-at-large from New York to the National Democratic Convention in 1912. In 1913 he was counsel for the managers of the trial leading to the impeachment of Governor Sulzer of New York.

**PARKER, SIR GILBERT, BART.** (1862— ), English novelist and politician (*see* 20.827), was created a baronet in 1915 and a privy councillor in 1916. During the first two and a half years of the World War he was engaged on the work of publicity in

British interests in the United States, and he published *The World in the Crucible* (1915) and *The World for Sale* (1916). Amongst his later works of fiction are *The Judgment House* (1913); *The Money Master* (1915); *Wild Youth and Another* (1919) and *No Defence* (1920). He retired from Parliament in 1918 and did not seek reelection.

**PARKER, HORATIO WILLIAM** (1863–1919), American composer and musician, was born at Auburndale, Mass., Sept. 15 1863. His talent for composition manifested itself early; before he was 15, for example, in less than two days he set to music the verses in Kate Greenaway's *Under the Window*. He studied first in Boston, but later attended for three years the Royal Conservatory in Munich. After his return to America in 1885 he was for two years professor of music in the Cathedral School of St. Paul in Garden City, Long Island. From 1888 to 1893 he was organist of Trinity church, New York City, and from 1893 to 1901 organist of Trinity church, Boston. In 1894 he was appointed professor of the theory of music at Yale. Cambridge University bestowed on him the degree of Mus. Doc. in 1902. Before leaving New York City he had completed his oratorio, *Hora Novissima*, which was widely performed in America. It was also given in England in 1899 at Chester and at the "Three Choirs" festival at Worcester, the latter an honour never before paid an American composer. While carrying out the duties of his position at Yale he composed much. His opera *Mona* (libretto by Brian Hooker) won the Metropolitan Opera Company's \$10,000 prize in 1911, and in 1914 his opera *Fairyland* (also with Hooker) was awarded another prize of the same amount offered by the National Federation of Women's Clubs. His cantata *Morven and the Grail* was written in 1915 for the centenary celebration of the Handel and Haydn Society of Boston. His other works include the cantatas *King Trojan* and *The Kobolds*, the oratorios *St. Christopher* and *A Wanderer's Psalm*, besides numerous sacred and secular pieces. He died at Cedarhurst, Long Island, Dec. 18 1919.

**PARKER OF WADDINGTON, ROBERT JOHN PARKER, BARON** (1857–1918), English lawyer and lord of appeal, was born at Claxby Rectory, Alford, Lincs., Feb. 25 1857. He was educated at Eton and King's College, Cambridge, where he took his degree in 1880. In 1883 he was called to the bar and built up a large and important connexion, largely dealing with Government work. In 1900 he was appointed junior counsel to the Treasury, and was raised to the bench in 1906. As a judge he earned a high reputation for great shrewdness and learning, and in 1913 was made a lord of appeal in ordinary, being at the same time given a life peerage over the heads of the five sitting lords justices. In 1916 a special second division of the Judicial Committee of the Privy Council was constituted for dealing with Prize Court appeals, and over this Lord Parker presided until within a short time of his death at Haslemere July 12 1918.

**PARKIN, SIR GEORGE ROBERT** (1846– ), British educationalist (see 20.831), published in 1912 *The Rhodes Scholarships*, an account of his work as organizing representative of the Rhodes Trust (see 23.257). He was knighted in 1920. He retired from the secretaryship of the Rhodes Trust in 1921, being succeeded first by Sir Edward Grigg, and then, on the appointment of the latter to be private secretary to Mr. Lloyd George, by Mr. Geoffrey Dawson, formerly (1912–9) editor of *The Times*.

**PARMOOR, CHARLES ALFRED CRIPPS, 1ST BARON** (1852– ), English lawyer, was born at West Ilsley, Berks., Oct. 3 1852, the son of Henry William Cripps, Q.C. He was educated at Winchester and New College, Oxford, where he had a distinguished career. He was called to the bar of the Middle Temple in 1877, in 1890 became a Q.C. and in 1893 a bencher. In 1895 he was appointed attorney-general to the Prince of Wales (being reappointed in 1901 and 1912). He sat as Conservative member for the Stroud division of Glos. 1895–1900, for the Stretford division of Lancs. 1901–6 and for the Wycombe division of Bucks. 1910–4. In 1908 he was made K.C.V.O. Sir Alfred Cripps was well known as a strong High-churchman. He was appointed chancellor and vicar-general to the province

of York in 1900 and vicar-general to the province of Canterbury in 1902. He was chairman of the Canterbury House of Laymen and a member of its committee in 1910, and chairman of the House of Laity in the National Church Assembly of 1920. In 1914 he was appointed a member of the Judicial Committee of the Privy Council and raised to the peerage, and in 1917 he became treasurer of the Middle Temple. He was the author of two important works, *Law of Compensation* (1881, 5th ed., 1905), and *Law Relating to the Church* (6th ed., 1886).

**PARRATT, SIR WALTER** (1841– ), English organist, was born at Huddersfield Feb. 10 1841. He was educated privately and at College School, Huddersfield. After some years as organist and choirmaster to various churches, he became in 1872 organist of Magdalen College, Oxford, and in 1882 organist of St. George's Chapel, Windsor. From 1908 to 1918 he was professor of music at Oxford, and in 1916 was appointed dean of the faculty of music in London University. He was knighted in 1892, was created M.V.O. in 1901, and C.V.O. in 1917. He wrote various important articles on musical subjects for Grove's *Dictionary of Music*, and other works.

**PARRY, SIR CHARLES HUBERT HASTINGS, BART.** (1848–1918), English composer (see 20.865), retired from his professorship at Oxford in 1908. He acted during the World War as chairman of the Music in Wartime Committee, and did much to relieve the prevailing distress among poorer musicians. He died at Rustington Oct. 7 1918, and was buried in St. Paul's cathedral.

**PARSONS, ALFRED** (1847–1920), English painter, was born at Beckington, Som., Dec. 2 1847. He was educated privately, and in 1865 entered the General Post-Office as a clerk, but after two years his taste for painting decided him to adopt an artistic career. He was preëminently a painter of flowers and gardens. He was also interested in the designing of gardens, and was a judge at the Chelsea flower show. His picture of an orchard, "When Nature Painted All Things Gay," was purchased by the Chantry fund in 1887, and he was a frequent exhibitor not only at the Royal Academy but at the Grosvenor and New Gallery exhibitions. Among the various special exhibitions held of his work was one of scenes from the Warwickshire Avon (1885). As an illustrator Parsons took a very high place, much of his work appearing in *Harper's Magazine*, while among the books he illustrated are *She Stoops to Conquer*, Herrick's *Poems* (with E. A. Abbey), and *The Danube, from the Black Forest to the Black Sea* (with F. D. Millet). He died at Broadway, Worcs., Jan. 16 1920.

**PARSONS, SIR CHARLES ALGERNON** (1854– ), British engineer, was born in London June 13 1854, the fourth son of the 3rd Earl of Rosse. He was educated privately and at St. John's College, Cambridge, graduating 11th wrangler in 1876, and being elected in later life (1904) an hon. fellow of the college. In 1877 he entered the Armstrong Works at Elswick, having previously worked as a boy in his father's workshops at Birr Castle, King's co., Ireland, where the Rosse telescope was constructed (see 23.745). In 1883 he served for a year on the experimental staff of Messrs. Kitson of Leeds, and in 1884 entered into partnership with Messrs. Clarke Chapman & Co. of Gateshead. The partnership was dissolved in 1889, and Charles Parsons, whose invention of the Parsons steam-turbine was bringing him into continually greater prominence in connexion with the progress of shipbuilding, then built his own works at Heaton, Newcastle-upon-Tyne, for the making of steam-turbines, dynamos, searchlight reflectors and other electrical apparatus (see 25.845 seq.). Besides his chairmanship of C. A. Parsons & Co., he became managing director of several electric supply companies, notably at Newcastle, Scarborough and Cambridge, and also of the Marine Steam Turbine Co. which became the Parsons Marine Steam Turbine Co. of Wallsend-on-Tyne, owners of the turbine patents, with ramifications throughout the engineering world. He was elected F.R.S. in 1898, won the Royal Society's Rumford Medal in 1902, was president of the Institute of Marine Engineers 1905–6 and of the British Association 1919–20. In 1911 he was created K.C.B. During the World War Sir Charles

Parsons served on many Government committees connected with scientific research, electric power, aircraft, fuel research and the construction of tanks.

**PASCAL, JEAN LOUIS** (1837-1920), French architect, was born in Paris June 4 1837, and his architectural education was begun at the age of 16 when he became a pupil of Gilbert. Later, when in the studio of Questel, he entered the École des Beaux-Arts, where, amongst other distinctions gained, in 1866 he won the *Grand Prix de Rome*. On his return to Paris in 1870, after his four years at the Villa Medici, he was appointed inspector of works at the Louvre and the Tuilleries. In 1872 he became patron of his *atelier*, and thereafter was appointed assessor in public competitions, and subsequently received many distinctions. Amongst these was his election to the council of the Beaux-Arts and president of the jury, and to membership of the Institut de France, and finally he became *commandeur de la Légion d'Honneur*. In his long career the private, as apart from official, work of Pascal was of a very diversified nature, and covered a wide area of ground, domestic and civil, and particularly a long series of artistic memorial monuments such as those commemorating Col. d'Argy at Rome, Henri Regnault at the École des Beaux-Arts, and President Carnot at Bordeaux. Among his buildings are the Château du Doux, Corrèze, that for the Faculté de Médecine, Bordeaux—a design with much dignity and calm—the painter Perrault's house and studio, Paris, and several villas and châteaux in the provinces—at Pau, Beaulieu, Avignon and elsewhere. He lived long enough to see, at the close of his busy career of over 50 years, the completion of the Bibliothèque Nationale, Paris, a fine building characteristic of his learning and ingenuity, but speaking none of the modern note of a too conscious individuality. A man of untiring energy, Pascal's application to his *atelier* work and his many professional calls did not prevent his finding time for the literary side of architecture and he, with M. Gaudet, is responsible for the splendid edition of Blondel's *Architecture Française*, published under the auspices of the French Government. The celebrated *atelier* of which he was for so many years the greatly respected patron, was responsible in his time for the training of many architects to be found later on in every country in Europe, in the United States and in Canada. Among them were Sir John Burnet, Thomas Hastings of New York, Signor Beltrani of Milan and Henri Nénot of Paris. In 1914 he was awarded the gold medal of the Royal Institute of British Architects but his great age and state of health prevented his receiving this in person. He died in Paris in 1920.

**PASCOLI, GIOVANNI** (1855-1912), Italian poet, was born at San Mauro, Romagna, Dec. 31 1855. His first volume of verse, entitled *Myricae*, appeared in 1891, and his *Primi Poemetti* in 1897. His other volumes include *Odi ed inni* (1906); *Le Canzoni di Re Enzo* (1908) and *Nuovi Poemetti* (1909). He wrote also much elegant Latin verse, and was well known both as a prose essayist and for his Dante studies, which led to his appointment as professor of Italian literature at the university of Bologna. He died at Barga April 6 1912.

**PASSY, FRÉDÉRIC** (1822-1912), French economist and pacifist, was born in 1822 and was a nephew of the economist Hippolyte Passy, finance minister to Louis Philippe and to Louis Napoleon's Republican Government. Under his uncle's influence Frédéric devoted himself to economic studies, and to that end gave up the appointment as auditor of the Conseil de Droit, which he had held during 1846-49. In 1860 he began to teach political economy both in Paris and in the provinces. His first work on the subject, *Mélanges économiques*, appeared in 1857. True to his republican principles, he refused to be reconciled to the Second Empire, and remained, therefore, ineligible for any Government post. He was an ardent free-trader and an admirer of Cobden. In 1867 he founded the Ligue Internationale de la Paix, afterwards known as the Société Française pour l'Arbitrage entre Nations, and for the rest of his life he devoted himself to the promotion of international peace. From 1881 to 1899 he was deputy for the Seine department. In 1901 he received the Nobel Prize, sharing it with M. Dunant. His published works include

*De la Propriété Intellectuelle* (1859); *Leçons d'économie politique* (1860-61); *La Démocratie et l'Instruction* (1864); *L'Histoire du Travail* (1873); *Malthus et sa Doctrine* (1868); *La Solidarité du Travail et du Capital* (1875) and *Le Petit Poucet du 19ième Siècle*; *George Stephenson* (1881). He died in Paris June 12 1912.

**PATIALA, SIR BHUPINDR SINGH, MAHARAJA OF** (1891- ), head of the Sikh community in India, was born Oct. 12 1891, to the soldier-sportsman Maharaja Sir Rajendra Singh, whose death in Nov. 1900, at the age of 28, brought him to the *gadi*. He was carefully trained, and on receiving full ruling powers at the close of 1910 maintained and greatly developed the progressive policy of the council of regency, applying himself with great assiduity to the moral and material welfare of his people. Inheriting sporting and soldierly qualities, he was a skilful polo-player and batsman, becoming well known to British crowds when he captained the Indian cricket eleven in 1911. He also inherited the conspicuous loyalty of his house to the paramount Power. In the autumn of 1914 he set out with the Indian Expeditionary Force to France, but serious ill-health compelled his return to India after reaching Aden. The contribution of Patiala to the Indian army, including Imperial Service troops, was increased from about 4,000 men to 28,000, and as the recognized head of the Sikh race the Maharaja exercised an enormous influence in promoting recruitment from other parts of the Punjab. His subjects saw active service in nearly all the theatres of war, and won 125 battle distinctions. His gifts in material and money were constant and generous. He visited his troops in France, Palestine and elsewhere when deputed to England in the summer of 1918 with Sir S. P. (Lord) Sinha on selection as a member of the Imperial War Cabinet, being the second Indian prince to be called to Empire councils. In the Punjab disturbances in the spring of 1919 important responsibilities were assigned to him by the British authorities, and tranquillity was maintained throughout his state and adjacent British districts. In the third Afghan War which immediately followed he volunteered his personal services as well as the loan of his troops, and held a staff appointment in a trying hot-weather campaign, not returning from the frontier until an armistice was granted the Amir Amanulla. He took a prominent part in promoting the inauguration of the Chamber of Princes in 1921 and was elected to the small standing committee. He was raised to the rank of major-general, his permanent local salute was raised from 17 to 19 guns, and he held the grand crosses of the Star of India, the Indian Empire and the British Empire.

**PATON, FREDERICK NOEL** (1861-1914), British explorer and Anglo-Indian official (see 20.936\*), died July 1 1914.

**PATON, JOHN BROWN** (1830-1911), British Nonconformist divine (see 20.930), died at Nottingham Jan. 26 1911.

**PATTI, ADELINA JUANA MARIA** [BARONESS CEDERSTRÖM] (1843-1919), English singer (see 20.937), died at Craig-y-Nos Castle, Wales, Sept. 27 1919.

**PAYNE, JOHN BARTON** (1855- ), American public official, was born at Pruntytown, Va., Jan. 26 1855. He was educated at Orleans, Va., read law, and was admitted to the bar in 1876. He moved to West Virginia and practised law at Kingwood from 1877 to 1882, during the same period serving as chairman of the county Democratic committee. In 1882 he was elected mayor of Kingwood, and the following year went to Chicago, where he was engaged in law practice until 1893. Then he was appointed judge of the Superior Court of Cook Co., Ill., but resigned after five years to resume the practice of law. In Nov. 1917 he was appointed counsel of the Emergency Fleet Corporation and also legal adviser to the Commissioner of Internal Revenue. In 1918 he was appointed counsel of the Director-General of Railroads and in 1919 chairman of the U. S. Shipping Board. In Feb. 1920 he was appointed Secretary of the Interior, to succeed Franklin K. Lane, and he served to the end of President Wilson's term.

**PEACE CONFERENCE** (1919).—The first plenary session of the Conference of the Powers assembled in Paris to settle the terms of peace after the World War was held on Jan. 18 1919, more than two months after the conclusion of the Armistice with Germany; and the Conference remained in being from

\* These figures indicate the volume and page number of the previous article.

that date until Jan. 21 1920, when the Supreme Council met for the last time. Even then the work of the peace settlement was incomplete. What remained to be done was partly delegated to a council of ambassadors at Paris, partly left to the Premiers of the principal Powers, who continued to meet in consultation at irregular intervals during 1920 and 1921. The Conference separated before the Hungarians had decided to sign their treaty, and before the terms of the partition of the Ottoman Empire were finally agreed upon. It left the Adriatic question in such a state that 10 months elapsed before Italy and Yugoslavia could compose their differences. The total sum to be demanded from Germany in the name of reparation had not yet been settled, nor had the principal Powers finally agreed in what proportions this sum should be divided between them. But the events of 1920 showed that most, if not all, of these questions could be arranged without the cumbersome mechanism of a conference. An even more momentous uncertainty, the problem of the future attitude of the United States towards the treaties, would obviously be solved at Washington and not at Paris. But the most urgent difficulties of the transition from war to peace had been met, so far as diplomacy could meet them, before the Conference was six months old; and, after the German treaty had been signed, the doings of the statesmen at Paris no longer excited the same interest as before. The most important of these statesmen, except the French Premier, M. Georges Clemenceau, soon made their exit. In the last days of June 1919 Mr. Wilson returned to the United States, Mr. Lloyd George to London. Sig. Orlando had fallen from power before the signing of the treaty, and his successor, Signor Nitti, abstained from visiting Paris. In July Mr. Lansing, the American Secretary of State, withdrew, leaving Mr. Polk, his under-secretary, to act for him. In Sept., after the signing of the Austrian treaty, Mr. Balfour departed and Sir Eyre Crowe became the chief British plenipotentiary. By June 28 the main outlines of the new map of Europe were drawn; the principles which were to govern all the treaties had been laid down; Germany had been rendered powerless for evil, and the Austro-Hungarian Monarchy had ceased to exist.

*The Secret Treaties and the Pre-Armistice Terms.*—The Allied and Associated Powers entered the Conference with a load of previous commitments.<sup>1</sup> The three chief European Allies had to consider many secret undertakings given at critical periods of the war. In April 1915 France and Great Britain had purchased Italy's co-operation by the Treaty of London, which gave very definite pledges regarding Istria, Dalmatia, Cisalpine Tyrol, the Dodecanese and Adalia. In May 1916 France and Great Britain had mapped out their future spheres of influence in the Ottoman Empire; and in 1917 there had been consequential arrangements with Italy. In Aug. 1916 all three Powers had given pledges to Rumania regarding her claims on Hungarian territory, pledges which Rumania at least did not regard as invalidated by her subsequent Treaty (of Bucharest, May 1918) with the Central Powers. In Feb. 1917 all three had agreed with Japan to uphold her claims on Shantung. Finally there were agreements of a less definite character with Serbia and with Greece. It remained to be seen how far these compacts could be reconciled with each other and with the views of the United States, who had not endorsed any of them and was officially unaware of them up to the opening of the Conference. There remained the pre-Armistice terms which were binding on all the parties to the Conference, and which indisputably must prevail wherever they came into conflict with treaties of prior date. Drafted at Washington, on the basis of a separate correspondence between Mr. Wilson and the German Government, they had nevertheless been considered and adopted (with certain amendments) by the Supreme War Council of the Allies as the foundation of the future peace. This meant that (with the exceptions which they or Mr. Wilson had specified in Oct. and Nov. 1918) the Allies were bound to impose no terms which clashed with

Mr. Wilson's Fourteen Points (of Jan. 8 1918), his Four Principles (of Feb. 11), his Four Ends (of July 4) and his Five Particulars (of Sept. 27).

This peculiar obligation was the outcome of an offer, made by Germany on Oct. 4 1918, "to accept the programme set forth by the President of the United States in his message to Congress of Jan. 8 1918, and his later pronouncements, especially his speech of Sept. 27," as a basis for peace negotiations. A similar offer was made by the Austro-Hungarian Government on Oct. 7. From Germany the President required, as a condition precedent to negotiations, that "the military masters and monarchical autocrats of Germany" should be irrevocably deposed. To Austria-Hungary he intimated that in one particular he could no longer stand by the Fourteen Points. It was no longer sufficient that the Czechoslovaks and the Yugoslavs should be guaranteed autonomy within the Austro-Hungarian state. These peoples must now decide what action on the part of Austria-Hungary would satisfy their aspirations. A republican Germany and a partition of Austria-Hungary were thus indicated as fundamental conditions of the peace. The Central Empires accepted the fiat; and the European Allies then agreed to make peace with Germany "on the terms of peace laid down in the President's Address to Congress and the principles enunciated in his subsequent addresses," with two qualifications. They reserved judgment on the second of the Fourteen Points "relating to what is commonly known as the freedom of the seas." They pointed out that, in their opinion, the President's demand for the "restoration" of territories invaded by Germany should be understood to include "compensation for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea and from the air." The President accepted explicitly this meaning of "restoration," and accepted *ex silentio* the demurrer as to the "freedom of the seas." After the Conference had begun, he stated to some American journalists (Feb. 14 1919) that the freedom of the seas was no longer needed, as in future (with a League of Nations in existence) there would be no neutrals. It will be noted that the reply of the Allies to the President only committed them with regard to the German treaty. The armistices signed by Austria (Nov. 3 1918) and Hungary (Nov. 13) were unconditional, and the Italian Government afterwards held that neither of these countries was entitled to the benefit of the Wilsonian terms. But the legal point was not pressed by the Allies in general, even against Bulgaria and Turkey with whom Mr. Wilson had not negotiated at all. The general view was that Germany had negotiated on behalf of both herself and her Allies; and indeed the Wilsonian terms which Germany accepted made explicit references both to Austria-Hungary and to Turkey.

*Purport of the Wilsonian Terms.*—The general principles contained in Mr. Wilson's manifestoes were not all of the kind that a Peace Conference could enforce or promote. Some were principles of international morality; others could hardly be realized in a world which was still convulsed by national and racial animosities, by the sense of intolerable wrongs and of crushing disillusionments. The time was not yet ripe for insisting that the victors, equally with the vanquished, should abstain from "private international understandings of any kind," should throw down all "economic barriers" and should guarantee "equality of trade conditions" (most favoured nation treatment) to their former enemies. Still less could the Allies agree at that date to give "adequate guarantees" that their armaments should be "reduced to the lowest point consistent with domestic safety" within any definite period of time. It was easier for the Allies to accept some other principles which made a strong appeal to the moral sense of mankind: as, for instance, that nations ought to be governed in their foreign policy by the rules of private honour and by respect for the common law of civilized society; that "every part of the final settlement must be based upon the essential justice of that particular case, and upon such adjustments as are most likely to bring a peace that will be permanent"; and that "no

<sup>1</sup>For the preliminaries leading to the Armistice of Nov. 11 1918, see under WORLD WAR. See also, for points unsettled at the Peace Conference, SILESIA and other appropriate headings.

special or separate interest of any single nation, or any group of nations, can be made the basis of any part of the settlement which is not consistent with the common interest of all." These, and other similar rules, were valuable as a statement of the spirit in which the wiser heads of the Conference would approach their work. But the Conference could hardly do more for the propagation of Mr. Wilson's ideals than it did in approving the Anglo-American scheme of a League of Nations "formed under specific covenants" to ensure that "the combined power of free nations will check every invasion of right." When it provided that the Covenant of the League should form an integral part of each of the new treaties, and when it made the League responsible for supervising and revising many parts of the peace settlement, the Conference loyally accepted the conception of the League which Mr. Wilson had explained in his address of Sept. 27 and in several speeches of his European tour (Dec. 1918-Jan. 1919). The League was planned to be, as he had said at the Guildhall in London on Dec. 28, a permanent concert of Powers for the maintenance of the peace terms. It is easy now to blame the Allies for assuming that the Covenant, drafted by Lord Robert Cecil and Gen. Smuts in consultation with Mr. Wilson and Col. House, would be accepted without demur by the U.S. Senate. But their attitude towards the project of the League, when it was under discussion at the Conference, at least proves them honestly desirous of realizing Mr. Wilson's aspirations.

The territorial terms which Mr. Wilson had formulated were comparatively simple, though not always easy to reconcile with his principle of self-determination, which required that "every question whether of territory or of sovereignty, of economic arrangement or of political relationship" should be settled on the basis of "the free acceptance of that settlement by the people immediately concerned." Mr. Wilson himself subsequently confessed that, when he put self-determination on his programme (in spite of Mr. Lansing's fruitless objections, since revealed), he did so in ignorance of the very existence of some of the nationalities which afterwards invoked his aid. Literally and unconditionally applied, the principle of self-determination would have reduced eastern Europe to a chaos of privileged enclaves and economically helpless states; nor was it easy to see how it could be applied with any useful results to the German colonies or to the non-Turkish portions of the Ottoman Empire. The first of these two difficult cases was hardly met by Mr. Wilson's demand (in the Fourteen Points) that colonial questions should be settled with equal regard to the interests of the populations concerned and to the equitable claims of the Government whose title was to be determined. The solution eventually applied to both cases was that of mandates, a device first suggested by Gen. Smuts in Dec. 1918, and readily endorsed by Mr. Wilson when it was brought to his notice. As for the minor European nationalities, Mr. Wilson himself had already, before the Conference, indicated that their aspirations could not in every case be satisfied "without introducing new or perpetuating old elements of discord and antagonism that would be likely in time to break the peace of Europe and consequently of the world." This at least made it clear that a plebiscite would not be assumed to be in every case the one unfailing criterion of the justice of national claims.

The following is a brief summary of the territorial terms to which the Allied and Associated Powers were committed by the pre-Armistice negotiations: (1) Germany was to evacuate all Russian territory, and (2) to recognize the independence of all territories inhabited by indisputably Polish populations. (3) Belgium and the occupied territories of France, Rumania, Serbia and Montenegro were to be evacuated. (4) Belgium was to be left in the position of a sovereign state. (5) Alsace and Lorraine were to be returned to France. (6) Poland and Serbia were to be given free and secure access to the sea. (7) The independence and territorial integrity of Poland and the Balkan states were to be assured by international guarantees. (8) The Turkish portions of the Ottoman Empire were to be allowed

to form a sovereign state; but the Straits were to be placed under international control, and the non-Turkish nationalities were to be allowed "an absolutely unmolested opportunity of autonomous development." (9) The Czechoslovaks and the Yugoslavs within the Austro-Hungarian Monarchy were to determine their own political destiny. We may further mention Mr. Wilson's Ninth Point, demanding a readjustment of the frontiers of Italy along "clearly recognizable lines of nationality." To this limitation of Italy's ambitions Sig. Orlando had never agreed. But his protest was not, unluckily, made public till May 1919.

*Opening of the Conference.*—The invitations to the Conference were issued by the five principal and associated Powers, whose chief plenipotentiaries held consultations in Dec. and the early days of Jan. 1919, before they formally assembled at Paris. Mr. Wilson was in Paris from Dec. 13 to Dec. 25, in England from Dec. 26 to Dec. 31, in Italy from Jan. 3 to Jan. 6. M. Clemenceau, Sig. Orlando and Baron Sonnino visited London early in December. Finally, on Jan. 12, there took place at the Quai d'Orsay a meeting of the Supreme War Council (a body constituted in Nov. 1917) which was attended by Mr. Wilson and Mr. Lansing, M. Clemenceau and M. Pichon, Mr. Lloyd George and Mr. Balfour, Sig. Orlando and Baron Sonnino. On this occasion it was decided that only the representatives of the five chief Allied and Associated Powers (the fifth being Japan) should be entitled to attend all meetings of the Conference, and that other members should be summoned only when their special interests were involved in the discussion. The decision was taken without the other Allied and Associated Powers being consulted, but was in harmony with the practice of the Congress of Vienna (1815), and was defended on the ground that the five were "Powers with general interests." Membership of the Conference was accorded to 32 Powers in all. Enemy Powers were not admitted, and neutral Powers were only to attend, when specially summoned by the five, at sessions specially appropriated to the discussion of their claims. But all belligerents, and all Powers who had severed diplomatic relations with Germany, were entitled to appear at every plenary session. It had been originally proposed to put all "new states in process of formation" on the same footing as the neutrals with special interests. But the right of Poland and of Czechoslovakia to be represented in the Conference was conceded before the first plenary session. Croats and Slovenians were in fact represented by the Serbians, but the enlarged kingdom of Serbia, owing to the opposition of Italy, was not officially recognized until the end of May. The five principal Powers settled the number of plenipotentiaries by whom each state might be represented, with special regard to the military importance of each Power and to the part which it had played in the war. The number of plenipotentiaries was a question of sentiment only, since no Power exercised more than one vote; but the question was not settled without some bickering. Finally five plenipotentiaries were assigned to each of the principal Powers; three apiece to Belgium, Brazil and Serbia, two apiece to Canada, Australia, South Africa, India, China, Czechoslovakia, Greece, the Hejaz, Poland, Portugal, Rumania, Siam; one apiece to New Zealand, Bolivia, Cuba, Ecuador, Guatemala, Haiti, Honduras, Liberia, Nicaragua, Panama, Peru, Uruguay. All the Powers were allowed to make use of the panel system in choosing their plenipotentiaries, and the representatives of the British Dominions did important work on more than one occasion by virtue of their position on the panel of the British Empire. These arrangements were complete before the first plenary session (Jan. 18), which was merely asked to transact some formal business, on lines settled in advance by the Five. It elected M. Clemenceau as president of the Conference; it sanctioned the appointment of a secretariat, and also of a drafting committee on which the Five alone were represented. At the second plenary session (Jan. 25) certain of the minor Powers, Belgium and Canada amongst them, protested against the degree of control which the Five had assumed over the proceedings of the Conference. These protests were

bluntly answered by M. Clemenceau; but they could not be altogether ignored. The smaller Allies were by degrees allowed a larger representation on some of the commissions and committees; and in this way a use was found for the abilities and experience of some highly distinguished statesmen, such as M. Venizelos.

**Organization and Procedure.**—The original rules of procedure, drafted by M. Berthelot, do not throw much light on the methods of transacting business which were actually employed, and in some points they were quickly modified.<sup>1</sup> The conduct of affairs, until March 25, was in the hands of the Council of Ten, a body composed of two plenipotentiaries for each of the five Powers; it was simply the Supreme War Council adapted to new purposes. The plenipotentiaries were allowed to bring their expert advisers with them, and made free use of this permission; but the Council from the first availed itself of the power, accorded under rule 13, to refer technical questions to committees of experts. The proceedings of the Ten were secret; rule 8 provided for the publication of official *communiqués*, but these were usually so worded as to convey the minimum of information. Owing to the large numbers present at each session, the secrecy of the proceedings was seldom respected; and, while the unofficial reports published in the French press were severely censored, the correspondents of English and (more particularly) American papers were often successful in acquiring and transmitting important information. On Jan. 17 the Ten promised, in answering a protest from the correspondents, that the plenary sessions should be open to them, except in special cases. But these sessions were infrequent and, when they were open to the press, only transacted formal business. Those of May 6 and May 31, at which important differences of opinion became manifest, were held behind closed doors. The secrecy of the deliberations grew more complete after March 25, when the Council of Ten was superseded by the Council of Four (Mr. Wilson, M. Clemenceau, Mr. Lloyd George, Sig. Orlando). Thenceforward experts were merely summoned to answer questions; for over three weeks the only official continuously present was the interpreter (M. Mantoux); but in April Sir Maurice Hankey was admitted as secretary. The Four delegated certain questions to a council of five foreign ministers (Mr. Lansing, M. Pichon, Mr. Balfour, Baron Sonnino, Baron Makino), but this body did not become prominent until the end of June when the Four dispersed and left all current business to be transacted by the Five.

Each of the principal Powers, except France, provided its plenipotentiaries with a large staff of officials and other experts. These "delegations" served as panels from which was drawn the personnel of the innumerable commissions and committees appointed from time to time by the plenary sessions or by the Supreme Council.<sup>2</sup> Most of the earlier commissions were large and imposing bodies; each of the principal Powers contributed two or three representatives to each commission, while the other Powers were allowed to send, between them, five or ten. This was the constitution of the commissions on Reparations, on the Responsibility for the War, on the League of Nations, on International Labour Legislation, on Ports, Waterways and Railways, all of which were sanctioned by the second plenary conference (Jan 25). In Feb. and March five territorial commissions were constituted. On these only the principal Powers were represented. The subjects referred to them were the territorial claims of: (1) the Czechoslovaks, (2) the Poles, (3) Rumania and the Yugoslavs, (4) Greece and Albania,

<sup>1</sup> English was recognized at the Conference as of full equality with French as the official language, so that all the proceedings were bilingual. The British Dominions were recognized not only as an integral part of the British Empire delegation (being, for instance, part of the panel from which British representations on the Supreme Council were chosen), but also as states on an equality with other small independent states. Thus Gen. Botha and Gen. Smuts sometimes sat in the Supreme Council in one capacity and sometimes in the other.

<sup>2</sup> "Supreme Council" was the generic name applied to whatever body—the Ten, the Four or the Five—happened to be in control of the proceedings.

(5) Belgium and Denmark. On Jan. 27 the Supreme Council appointed a large economic commission to draft the articles of the German treaty which related to such subjects as commercial relations, shipping, industrial property, pre-war contracts, and the liquidation of enemy debts. On Feb. 12 a naval and military committee, under Marshal Foch, was created to draft the terms relating to disarmament and the surrender of naval and military material. The Council of Four, like the Council of Ten, constantly employed expert committees, but showed a preference for comparatively small bodies which could be trusted to work with expedition.

For business not immediately connected with the making of treaties the Supreme Council made considerable use of the Armistice Commission at Spá, of the military staff of the old Supreme War Council at Versailles, and of the Supreme Economic Council at Paris. The last named of these bodies was instituted, at the instance of Mr. Wilson (Feb. 8) to advise the Conference on any economic measures of a temporary character which might be necessary to ensure: (a) that the devastated areas were duly supplied with the raw materials and other commodities required for purposes of reconstruction; (b) that the economic life of other countries which had suffered from the war was promptly revived; (c) that the pressing wants of neutral and ex-enemy countries were satisfied without detriment to the Allied and Associated Powers. The Supreme Economic Council absorbed many of the functions of those inter-Allied councils which, during the later stages of the war, had been charged with special problems of food supply and relief work, finance, shipping and blockade. It also formed special sub-sections to advise on the reorganizing of inland communications by rail and water, and on the control of the raw materials required for reconstruction. Lord Robert Cecil, representing Great Britain, usually presided at meetings of the Supreme Economic Council. Mr. Hoover, who was one of the American representatives, made himself responsible for the Food and Relief section, which had to deal with the most urgent of all the duties referred to the Council. From Feb. 17 to the end of June the activity of the Supreme Council was unremitting. It was expected to see to the revictualling of Germany under the terms of the Armistice Convention. It organized relief work among the starving populations of eastern Europe. It reorganized the derelict transport systems of Austria-Hungary and Poland. Its German duties involved negotiations with a German finance commission, and the arranging of the Brussels agreement (March 14) under which Germany was supplied with foodstuffs up to the end of Aug. 1919. It was by successive recommendations of this council that the commercial blockade of Germany was partially relaxed in Feb., March and April; the most striking of these recommendations was that subjects of Allied countries should be free to trade with Germany, subject to any restrictions which their respective Governments might desire to maintain (April 24). In April the Council undertook to supervise the economic life of the left bank of the Rhine, during the period of occupation. After the German treaty had been signed the Supreme Economic Council was still utilized by the European Allies as an agent for the purchasing of foodstuffs in America and supplying Austria with coal. The last meeting was at Rome in Nov. 1919.

**The Council of Ten, Jan. 18–March 25 1919.**—The first section of the German treaty to be drafted in something like its final form was the Covenant of the League of Nations, which Mr. Wilson consistently regarded as "in a sense the most essential part of the peace settlement." By the end of Jan. the American and British delegates had agreed upon a draft. This was carefully discussed in the first fortnight of Feb. by the League of Nations Commission, on which were represented not only the five Great Powers, but also Belgium, Brazil, China, Portugal, Serbia, Greece, Rumania, Poland and Czechoslovakia. The most prominent personages who served on the commission, after Mr. Wilson who was its president, were Col. House (U.S.A.), Lord Robert Cecil and Gen. Smuts (British Empire), M. Bourgeois (France), Sig. Orlando (Italy) and M. Venizelos

(Greece). The Covenant passed its first reading at the third plenary session (Feb. 14), but was amended in details before it was finally approved by the fifth plenary session (April 28). The amendments were chiefly inspired by the wish to meet American criticism. One provided that members of the League might withdraw on giving two years' notice; another expressly guarded the Monroe Doctrine from attack. Among amendments which were considered but rejected it is enough to mention: (a) a Japanese proposal that there should be a clause declaring all members of the League, without respect of race or colour, to be equal; (b) an American proposal to forbid any discrimination "in fiscal and economic regulations" between one nation and another (which would have put an end to *Zollerheins* and to imperial preference); (c) a French proposal to endow the League with a general staff and with powers to supervise the process of disarmament. (*See LEAGUE OF NATIONS.*)

To the same period belongs the main work of the Labour Commission, which began to draft the Labour Convention on Feb. 1. The Convention was intended to convince the world that the interests of labour would be better served by supporting the Allies at Paris than by helping German Socialists to draft their Labour charter in the International Conference which sat at Berne in Jan. and February. The Commission, first proposed by M. Clemenceau, had an American chairman (Mr. Gompers); among the other prominent members were Mr. Barnes (Great Britain) and M. Vandervelde (Belgium). It contained no elected representatives of labour, but conferred with a number of labour leaders who were specially invited to Paris for the purpose. Its work proceeded smoothly and swiftly. The Convention enumerates nine fundamental principles, for drafting which Mr. Gompers was responsible; but otherwise it refrains from any attempt at remedial legislation. It is mainly concerned with outlining the organization, powers and procedure of a Labour Conference (an international labour parliament) and a Labour Office (a bureau of experts). The Convention links up the Labour Conference with the League of Nations, and provides that the original members of the League shall also be the original members of the Conference. The German delegates proposed (in May 1919) that the Convention should be revised by a conference of trade unions, in the light of the German Labour charter and of the Berne resolutions. This proposal was however rejected; the Convention in its final form owes nothing to German amendments. It forms section 13 of the Treaty of Versailles, and appears in all the other treaties with enemy powers. The Labour Conference met for the first time at Washington in the autumn of 1919, but was attended by no American delegates, owing to the fact that the U.S. Senate had not yet ratified the Treaty of Versailles. (*See INTERNATIONAL LABOUR.*)

The Labour Convention was not presented to the Conference until April 1, and for some weeks after the third plenary session (Feb. 14) it seemed as though the Ten and their satellitic commissions were making little progress. This impression was strengthened by the temporary absence of Mr. Lloyd George (Feb. 7–March 5) and of Mr. Wilson (Feb. 14–March 14), who departed on urgent business of different kinds to London and to Washington respectively. For a time the Supreme Council was also robbed of M. Clemenceau; he was wounded on Feb. 19 by a French anarchist and was not seen again in public until March 10. But in any case the Supreme Council was at this stage burdened with a mass of formal duties which could not be avoided or postponed. It was necessary, under the rules of procedure, to hear the views of the "members with special interests." Late in Jan. audiences were given to the claimants for the German colonies, among whom the British Dominions were conspicuous. Then came the turn of the minor Powers and the oppressed nationalities: Rumania, Greece, Czechoslovakia, the Hejaz, Belgium, the Syrians, the Druses, the Zionists, the Yugoslavs, Denmark, the Albanians, the Armenians and the Montenegrins. The ceremonial interviews rarely added anything to the case which had been already presented in writing; and all the claims, except those involving considerations of high policy, were referred, as the interviews concluded, to

the five territorial commissions, and to a central commission which was appointed (Feb. 27) to coördinate the conclusions of the territorial experts. On a few questions there was substantial progress. A provisional agreement was reached as to the future of the German colonies. A Financial Drafting Commission defined the questions of finance and reparation which must be settled by the experts. Between Feb. 12 and March 3 the Military and Naval Drafting Committee prepared the first draft of the naval and military terms, and early in March Mr. Lloyd George persuaded the Supreme Council to accept the principle that all the enemy Powers should be obliged to abolish compulsory military service. By March 10 the naval, military and air terms were practically complete and on March 17, when Mr. Lloyd George was contemplating another visit to London, Mr. Wilson, M. Clemenceau and Sig. Orlando sent him a joint letter, begging that he would remain in Paris for the fortnight which, in their opinion, was the time required for completing the German treaty. Mr. Lloyd George agreed, but on condition that a more expeditious and more secret procedure than that of the Ten was adopted. He carried his point; on March 25 an official notice was issued that informal discussions by the delegates of the principal Powers would be substituted for the methods hitherto adopted. With this announcement began the period of the Council of Four. The Marquis Saonji, who might have claimed a seat in this conclave, abstained from doing so, except when Japanese interests were involved, on the ground of his ignorance of European languages.

*Council of Four, March 25–May 7.*—The Four worked at high pressure to complete the German treaty. They met two or three times a day; they confined their discussions to matters of principle and high policy; they left questions of detail and all technical subjects to the experts. But there were delicate and urgent problems, not all vitally connected with the treaty, which came up at many sessions, and some of these were never finally settled at Paris. The Four could never concentrate on one subject, to the exclusion of all others, until a definite agreement was reached; for each stage in a particular discussion involved a further reference to the experts, and a longer or shorter delay until the experts were ready with their report. Hence a chronological record of their debates, if such were available, would be a bewildering document. But it is known what were the more contentious topics debated in these six weeks, and what were the main issues in each case.

(a) *The guarantees for Germany's compliance with the treaty* were a special anxiety to France. She asked that there should be a prolonged occupation of the left bank of the Rhine by French, British and American forces; that the Rhine bridge-heads (Cologne, Coblenz and Mainz) should be included in the zone of occupation; that the left bank should be permanently detached from Germany to form a neutral and autonomous state ("Rhineland Republic"). Great Britain and America had offered France defensive treaties (the "Three Power Treaty") in lieu of these cumbersome precautions (March 14). M. Clemenceau accepted the treaties, but also pressed for the adoption of the French scheme. His colleagues would not hear of a Rhineland Republic; but they agreed that the left bank, and a deep belt on the right bank, should be denuded of fortifications (Art. 180); and, more reluctantly, that there should be joint occupation for 15 years. Still another concession was extracted from them—the last clause of Art. 429, which provides that, even at the end of 15 years, the occupation may be continued if in the opinion of the Allies France is insufficiently guaranteed against an unprovoked attack. This clause was intended to provide for the contingency of the British or the American defensive treaty being still unratified at that date.

(b) *The Saar valley* was claimed by France in compensation for her ruined mines. At first she had asked for complete political sovereignty on historical grounds; but this solution, which involved the subjection of 650,000 Germans to French rule, was rejected by her Allies, who would not even restore the French frontier of 1814 in this region. But they conceded to her the Saar coal-mines in full ownership, and, not without some

hesitation, agreed that for 15 years the Saar valley should be withdrawn from the control of Germany and placed under the League of Nations. At the end of that time the inhabitants were to decide between three alternatives—the *status quo*, union with France, union with Germany. If they voted for Germany, then France was to receive the price of the mines from Germany or from the Reparations Commission.

(c) The *Reparations Clauses* were also of special interest to France. Her representatives insisted passionately on "integral reparation," the assessment of the damage actually done by Germany and by her allies, and the exaction of the utmost farthing. How otherwise, they asked, could France escape bankruptcy? Many English and American experts were impressed by the exhaustion of Germany, the danger of driving her to desperation, the unwisdom of leaving her liability indeterminate for the many months which would pass before a complete bill for damages could be presented; and they pressed for taking in final quitance whatever sum (20 or 40 milliards of marks at most) Germany could be compelled to pay at once. The French view prevailed, but there was another battle over the categories of damage, and Mr. Wilson was persuaded only with great difficulty to admit that pensions and allowances to combatants and to their families came within the terms of his pre-Armistice conditions. There were further debates on the capacity of Germany to pay and on the sum for which she might conceivably be liable. In the end the extent both of her legal liability and of the sum to be actually paid was left for future definition. Germany was to pay 20 milliards of gold marks in cash and kind by May 1 1921; and out of this sum the Allies would pay for any foodstuffs or raw materials which they considered indispensable to Germany. Two further sums, each of 40 milliards, were to be exacted later, bringing the total to 100 milliards; but this, in the words of the treaty, was only "a first instalment." The final account would be presented by the Reparations Commission before May 1 1921, and would be paid off by degrees over a period of 30 years, with interest at 5 per cent. On Sept. 5 1919 the French Minister of Finance encouraged the Chamber to expect that 300 milliards might be extracted from Germany. In Jan. 1921 the European Allies agreed to exact one-third of this sum, payable with interest over 40 years, and supplemented by a tax of 12 per cent *ad valorem* on German exports. This was rejected by Germany, but at the end of April the Allies presented an ultimatum which was accepted.

(d) The delimitation of the western frontier of Poland was not effected without serious debates. France desired to treat Poland liberally. Great Britain was impressed with the risk of creating a new *Germania irredenta* to trouble the peace of eastern Europe. The experts were anxious that due weight should be given to Mr. Wilson's Thirteenth Point, which stipulated that Poland should have a free and secure access to the sea. Poland (supported by France) asked for full sovereignty over Danzig and the approaches to that city. But the population of Danzig was almost wholly German, and the frontier demanded by Poland would have left 2,000,000 Germans under Polish rule—a solution which Mr. Lloyd George considered inadmissible. Thanks to Mr. Lloyd George a compromise was at last arranged which left Danzig a free city under the protection of the League of Nations with a very exiguous degree of freedom. The Polish frontier, in this compromise, was still drawn with more regard to the economic interests of Poland than to the rights of nationalities. But, before the German treaty was signed, the frontier was again modified, and other changes were introduced, in deference to the expostulations of the German delegates; in particular it was determined that in Upper Silesia a plebiscite should be held.

(e) *Shantung* was demanded by the Japanese plenipotentiaries under the treaties which China had concluded with Japan in 1915, but which, according to the Chinese plenipotentiaries, had been extorted by *force majeure*; also under a secret agreement of 1917 with the European Allies, to which the United States had never adhered. For a long time Mr. Wilson

resisted the Japanese claim, but he finally accepted (April 30 1919) a compromise which the Chinese regarded with so much disfavour that they declined to sign the German treaty. The Japanese were allowed to keep the town of Kiaochow with the adjacent district, and the right of exploiting the mines and the railways in the Shantung peninsula; but they gave an oral understanding that they would restore the sovereignty of the peninsula to China "as soon as possible." Mr. Wilson subsequently (Aug. 19) told a committee of the American Senate that he would have preferred a different solution. But the Japanese claim was pressed at a time when Italy seemed on the point of seceding from the Conference; and a second secession would have made it difficult to conclude any treaty with the Germans.

(f) The *Italian claims* to Austro-Hungarian territories were continually under discussion during April. They were primarily founded on the Treaty of London; but Sig. Orlando claimed Fiume also, taking his stand in this case on the right of self-determination which he otherwise repudiated. Mr. Wilson at first argued that the Treaty of London was incompatible with the principle, enunciated in the Fourteen Points, that "a readjustment of the frontiers of Italy should be effected along clearly recognizable lines of nationality" (Point Nine). But Sig. Orlando objected that Italy was not bound by this principle, against which he himself had twice protested in the Supreme War Council, when the terms of the German Armistice were under discussion. His protests had been overruled at that time, on the ground that they were irrelevant to the discussions with Germany; but he had reserved the right to dispute Point Nine, and he asserted this right to the fullest extent in April. On April 14 Mr. Wilson gave way to the extent of intimating that he would accept the northern (Brenner) frontier assigned to Italy by the Treaty of London, and would admit Italy's claim (based on the same treaty) to Lissa and Valona; but he required that Fiume, as the natural outlet for the trade of Yugoslavia and Austria, should be made a free city within the Yugoslav customs area, and he held that, as regarded Dalmatia, Italy ought to be content with guarantees for the rights of the Italian minorities living in that province. Subsequently he rejected a proposal, made by M. Clemenceau and Mr. Lloyd George, that Italy should be awarded Fiume in exchange for a renunciation of her treaty claims upon Dalmatia; on April 20 he declined to discuss the Adriatic problem any further; and on the 23rd he created a sensation by publishing a statement of the grounds on which he resisted the Italian pretensions. Next day Sig. Orlando left the Conference, and Baron Sonnino followed him within 24 hours. On April 29 the Italian Chamber, after hearing Orlando's account of the negotiations, reaffirmed his definition of the Italian claims by an overwhelming majority. On April 30 the German delegates arrived at Versailles and the Council of Four (now reduced to three) had to face the possibility that Italy would not sign the treaty; at this time was drafted the ratification clause which stipulates that the treaty shall come into force as soon as ratified by Germany and any three of the principal Powers. But on May 4 Orlando relented. He and his colleagues reached Paris on May 7, a day too late for the sixth plenary session which approved the draft treaty, but a few hours before the draft was handed to the Germans at Versailles. The Council had not surrendered to Italy on the Adriatic question, but it was left open for future discussion.

*The Draft Treaty and the German Delegates.*—Two considerable sections of the treaty, the Covenant of the League and the Labour Convention, had been finally approved on April 28 by the fifth plenary session without much debate; the chief feature of the proceedings was that Baron Makino and M. Bourgeois expressed regret that the commission had not seen fit to accept the Japanese and French amendments. The sixth plenary session (May 6), which was held in secret to approve the treaty as a whole, revealed more serious differences. The Chinese protested against the Shantung clauses, the Portuguese against the African settlement, and Marshal Foch argued that the military guarantees for the submission of Germany were inadequate. His objection was met, to a certain extent, by the announcement,

on May 7, that the United States and Great Britain were prepared to sign treaties with France, guaranteeing her against German aggression. But the session of May 6 was remarkable for the strong undercurrent of dissatisfaction among the minor Powers "with special interests" (including the British Dominions) who felt that their views had not been sufficiently considered. On May 7 at the Trianon the Conference saw the draft treaty handed to Count Brockdorff-Rantzau, the principal German delegate, and heard him deliver, without rising from his chair, a sharp attack upon their dilatory methods. He stated that, in the past six months, the blockade had been responsible for hundreds of thousands of deaths in Germany. "Think of that when you speak of guilt and punishment." He and his countrymen accepted the liabilities to which they were committed by the Armistice and Mr. Wilson's terms. They were prepared to play their part in restoring Belgium and the devastated areas of France. But he intimated that Germany did not hope for a just peace. "We are under no illusions as to the extent of our defeat and the degree of our helplessness; . . . we know the power of the hatred that we encounter here."

Fifteen days were allowed the Germans for preparing their reply, but the term of grace was eventually extended to May 29. The German delegates, to expedite the negotiations, transmitted their criticisms by instalments, each dealing with one topic (League of Nations, Labour Charter, Saar Valley, etc.); in some cases they tendered several notes successively on the same subject. The Supreme Council had arranged that these notes should be considered by 13 committees, each of which was specially responsible for one section of the treaty, and interim replies were returned to the Germans very promptly. Consequently much of the disputed ground had been covered in preliminary correspondence before the German counter-proposals were presented as a whole; and M. Clemenceau was able to dispatch the reply of the Allies on June 16. Both documents were polemical in character. The Germans, besides criticising many particular articles of the draft treaty, argued that its general tenor was inconsistent with the terms of the pre-Armistice agreement; and the Allies repudiated this imputation with some heat. The main criticisms of the Germans are noted below. Their counter-proposals were numerous, and only the more striking can be given here: (a) *Reparation*.—They offered to pay a sum not exceeding 100 milliards of gold marks, partly in gold but mainly in commodities and services; but they claimed the right of appeal from the assessment of the Reparations Committee to a neutral arbitrator. They would pay the first 20 milliards by May 1 1926; but they claimed credit for all war material surrendered under the Armistice conditions, for state railways and state property ceded along with Alsace-Lorraine and the colonies, and for the share of the German public debts which, as they maintained, these territories ought to bear. No definite period was fixed for the payment of the remaining 80 milliards, though it was stated that Germany would allocate to this purpose annually a sum equal to the average *net* peace budget of the empire before the war and it was stipulated that no interest should be paid. (b) *Territorial*.—They demanded a plebiscite in Alsace-Lorraine which should give the inhabitants an option between union with France, union with Germany and complete independence. In lieu of the Saar valley they offered to France fixed annual supplies of coal, pending the reconstruction of the French mines. In lieu of ceding West Poland, Danzig and Memel they offered to make Danzig, Königsberg and Memel free ports (under German sovereignty). They demanded that Germany's claim to keep her colonies should be referred to arbitration. (c) *Commercial*.—They offered to the Allies "most favoured nation" treatment in German markets for a restricted number of years, upon condition of complete reciprocity; and "national" treatment to Allied goods passing over German railways (without a time limit) on the same condition. (d) *League of Nations*.—They offered to negotiate on this subject, taking the Allies' draft covenant as a basis. But, as conditions precedent to negotiation, they demanded that Germany should be admitted immediately to the League;

that members of the League should be pledged to abstain from waging economic war; that the Allied Powers should, within two years, abolish compulsory military service and themselves disarm. (e) *Occupied Territory*.—They proposed that the armies of occupation should be withdrawn within six months after the signing of the treaty.

These proposals constituted a manifesto addressed to the public outside the Conference; but in some particulars they agreed with proposals which had been forcibly argued in the inner circles of the plenipotentiaries. M. Tardieu and Mr. Wilson Harris have both stated, apparently on good authority, that the idea of mitigating the treaty in essential details was before the Supreme Council at various dates from May 23 to June 13, and that one reason for these discussions was a doubt whether the treaty, as it stood, could be enforced on a recalcitrant Germany. Mr. Lloyd George was now the spokesman of the critics; among these were counted the leading members of his Ministry, who, together with Dominion representatives, had been summoned to a special meeting at Paris on June 1. He protested against the idea of maintaining a large army of occupation for a considerable time. He was now (for a short while at least) in favour of a fixed indemnity; he advocated revision of the Polish frontier and the early admission of Germany to the League of Nations. But it was hardly possible to rewrite the treaty at this stage; the dangers of further delay were too serious to be lightly accepted. On June 13 the movement for revision came to an end. Its only consequences were some concessions on secondary points. On Reparation and Military Occupation the Allies stood by their original draft. They conceded some slight changes in the Polish frontier with the object of bringing it "into closer harmony with the ethnographic division." They agreed to a plebiscite in Upper Silesia. They intimated that they were opening negotiations at once for an eventual reduction of their own armaments. They withdrew a provision for internationalizing the Kiel canal. They promised that Germany, if she complied with the terms of the treaty, should be admitted to the League of Nations "in the early future." They invited Germany to offer, within four months of the signing of the treaty, a lump sum in settlement of the whole bill for reparation, but this suggestion was not accepted.

*Signing of the Treaties of Versailles, June 28*.—All arrangements had been made for a general advance of the Armies of Occupation in case the German Government refused to sign the treaty, and there were a few days of suspense while Count Brockdorff-Rantzau was conferring with his colleagues at Weimar. On June 20 the Scheidemann Cabinet resigned, ostensibly because it would not consent to sign, but actually from a well-founded consciousness that it no longer commanded the confidence of the German Labour party. On June 21 a new Premier, Herr Bauer, offered to sign on conditions: he stated that the articles requiring the surrender of war criminals and those declaring Germany to be the sole author of the war must be omitted. He was told that conditions could not be accepted, and on June 22 obtained the leave of the Weimar National Assembly to sign unconditionally. Formal assurances to this effect were given on June 23 at Versailles, through Herr Haimhausen who, on the previous day, had succeeded Brockdorff-Rantzau as head of the German delegation. During the last days of suspense the German warships interned at Scapa Flow were sunk by their commanders, acting, it was stated, on orders from the German Admiralty (June 21).

The new German Minister for Foreign Affairs, Herr Hermann Müller, and his colleague Dr. Bell signed the treaty on June 28 in the Salle des Glaces at Versailles in the presence of all the plenipotentiaries, except those of China, who absented themselves to emphasize their protest of May 6 against the Shantung articles. Before and after this ceremony several subsidiary treaties were signed: (a) Defensive treaties with France, by Great Britain and the United States, undertaking to defend France against unprovoked aggression. The British treaty was ratified by Great Britain on Nov. 20 1919, but it was not to become binding until the American treaty should be ratified;

and since American ratification was subsequently refused (see UNITED STATES: *History*), the British treaty became a dead letter. (b) A protocol defining certain ambiguous conditions in the German treaty. (c) An agreement between the United States, Belgium, the British Empire, France and Germany, which defines the nature of the military occupation of the Rhineland. (d) The Polish minorities treaty by which Poland contracts with the Allies and with Germany to respect the civil and political rights of racial and religious minorities within her jurisdiction. The idea of imposing such a treaty was first laid before the Conference by Jewish associations, whose fears were excited by the reports of Polish pogroms in the winter of 1918-9; but it was also of great importance for the protection of German and other non-Polish minorities. Similar treaties were afterwards concluded by the principal Powers with Czechoslovakia, with Rumania and with Yugoslavia. The main Treaty of Versailles was ratified by President Ebert, on behalf of Germany, on July 10; by the King of Italy, by King George V. and by President Poincaré in Oct. 1919. But it was not till Jan. 10, 1920, when Germany at last signed a protocol agreeing to give compensation for the ships which had been scuttled at Scapa Flow, that the final exchange of ratifications took place at Paris, and the state of war between the European Allies (but not the United States) and Germany was formally terminated.

*Treaty of Versailles—Territorial Terms.*—Germany surrenders Alsace and Lorraine to France, free and quit of all public debts (Arts. 51, 55), and accepts the arrangements regarding the Saar basin which have been described above (Art. 45-50). Luxemburg ceases to form part of the German *Zollverein*, and Germany renounces all rights over the railways in Luxemburg (Art. 40). Belgium receives Moresnet *neutre* and part of Prussian Moresnet (Arts. 32, 33); also Eupen and Malmédy (Art. 34) subject to the result of a plebiscite, which was held in Sept. 1920 and resulted in the final reunion of these districts to Belgium, by whom they had been continuously claimed since 1815. These acquisitions give Belgium some valuable forests and railway stations and a population of about 70,000 souls. The frontier between Germany and Denmark is to be settled in accordance with the wishes of the population (Art. 109); these were ascertained by plebiscites held in North Schleswig (Feb. 10 1920) and in Central Schleswig (March 14 1920) when the former district voted for reunion with Denmark and the latter voted for Germany. Under Art. 87 Germany recognizes the complete independence of Poland and surrenders Danzig together with the territories received by Prussia under the partitions of Poland (Posnanian, W. Prussia) and part of Middle Silesia; in 1910 these districts had a population of 2,931,000 souls of whom 1,087,000 were Germans. Article 88 provides for the plebiscite in Upper Silesia which had been conceded on June 16 1919; the voting (March 21 1921) seemed to prove that this clause was a concession of substance, and the subsequent award of the League of Nations (Oct. 1921), in favour of Poland, was correspondingly disappointing to Germany. By Arts. 94 and 96 plebiscites are ordered for the Masurenland region of East Prussia, and the West Prussian *Kreise* of Stuhm, Marienburg, Marienwerder and Rosenberg; in July 1920 both plebiscites produced substantial majorities for Germany. By Art. 99 Memel with the adjacent territory (total pop. 122,000 souls) is detached from East Prussia and put at the disposal of the principal Powers, who intended that Memel should be the port of Lithuania but had not, up to May 1921, given effect to that intention. Article 100 similarly assigns Danzig (pop. 200,000) to the principal Powers, who (in accordance with this Article) have recognized Danzig as a free city with an elected legislature under a high commissioner appointed by the League of Nations. But Poland will control the Vistula and the main railways within the territory of Danzig, and will be responsible for the foreign relations of the city, which is also to be brought within the Polish customs area (Art. 104).

Under Art. 156 Germany abandons to Japan her rights in the Shantung peninsula; she also renounces her concessions in

Hankow and Tientsin (Art. 132), her privileges in Egypt under the Capitulations (Art. 147) and all her treaty rights in Morocco (Art. 141). By Art. 119 she renounces in favour of the principal Powers all her overseas possessions. These, in accordance with Art. 22 of the Covenant of the League of Nations, will be administered by mandatories of the League. The Supreme Council made, on May 6 1919, a provisional distribution of mandates for the German colonies. German E. Africa was allotted to Great Britain, by whom it was renamed Kenya Colony (July 8 1920); but on May 30 1919, Great Britain resigned the districts of Urundi and Ruanda, which border on the Belgian Congo, to be held by Belgium under a separate mandate. German S.W. Africa went to the Dominion of South Africa. France and Great Britain received a joint mandate for Togoland and Cameroen, with permission to delimit their respective jurisdictions by mutual agreement. German New Guinea was entrusted to Australia, German Samoa to New Zealand, the island of Nauru (a rich source of phosphates) to Great Britain, the German islands in the North Pacific to Japan. But the United States subsequently announced (Feb. 21 1921) that Mr. Wilson did not agree to the island of Yap, an important cable station, being included in the Japanese mandate, and this question was one of the matters considered at the Washington Conference. (See WASHINGTON CONFERENCE.)

*Treaty of Versailles—Reparations and Financial and Commercial Terms.*—The articles of the treaty which define the sums to be paid by Germany have been epitomized above. The annexes to the Reparations section specify some of the payments in kind which Germany is to make immediately on account of reparation: (a) She is to surrender all her merchant ships of 1,600 tons gross and upward; one-half of her merchant ships between 1,600 and 1,000 tons gross; also one-quarter of her fishing fleet and a proportion not exceeding one-fifth of her river craft. By Feb. 10 1920 she had surrendered vessels of over 1,000 tons amounting to 1,824,828 tons gross. (b) She is to furnish live stock, machinery, equipment, tools and building materials for the reconstruction of devastated areas. (c) During the next 10 years she is to find annually 7,000,000 tons of coal for France, 8,000,000 tons for Belgium, and for Italy deliveries amounting on the average to 8,000,000 tons per annum. Also she is to make good the difference between the actual output of the French pits in the Nord and Pas de Calais and their pre-war average output. But, since May 1920, her total liability for coal has been reduced to 2,000,000 tons a month. According to the Conference note of June 16 1919, the Germans might terminate this system of payment in kind as soon as they pleased after May 1 1921. "If Germany raises the money required in her own way, the Reparations Commission cannot order that it shall be raised in some other way."

The Reparations Commission is a body appointed, under Art. 233, with the duties of estimating Germany's liabilities and her capacity to pay, of insisting on the due performance of her obligations to pay in gold and in kind, and of seeing that the German scheme of taxation "is fully as heavy proportionately as that of any of the Powers represented on the Commission." The Commission is to consist of seven delegates representing the principal Powers, Belgium and Yugoslavia; but no more than five of these may vote at any meeting. The United States, Great Britain, France and Italy have a vote on every occasion; Japan and Yugoslavia only vote when their special interests are concerned; Belgium votes when neither Japan nor Yugoslavia is entitled to do so. On certain questions the unanimous vote of the meeting is required to make the decision valid; as, for instance, on the question of cancelling the whole or any part of the debt or obligations of Germany. The powers assigned to the Commission were severely criticised at the Conference by the German delegates, who said that they were greater than those which any German emperor had ever possessed in Germany. It remained, however, to be seen how those powers would be utilized afterwards. The Commission has considerable powers under the other treaties, being made responsible, directly or indirectly, for the execution of the Reparations

clauses in each; and it was conceivable that it might remain in existence for the next 42 years, or even longer.

The financial clauses provide that Germany shall pay the costs of the armies of occupation (Art. 249). They safeguard the right of the Allied and Associated Powers to dispose of enemy assets and property within their respective jurisdictions (Art. 252)—a clause of great importance since the German assets held by Great Britain exceeded £120,000,000 sterling, and those held by the United States exceeded \$500,000,000. On the other hand, ceded German territories, other than Alsace-Lorraine and the German colonies, are to be burdened with a due proportion of the German pre-war debt (Arts. 254, 255, 257). Germany transfers to the Allies any claims she may have to payment or repayment by Austria, Hungary, Bulgaria and Turkey (Art. 261).

The most striking feature of the commercial terms is that they impose on Germany a number of unilateral obligations for limited periods of time. For five years she must grant "most favoured nation" treatment to the Allies, in respect of both her imports and her exports (Arts. 264-7). For five years goods imported into Germany from Alsace-Lorraine, up to the average quantities of the years 1911-3, are to be free from German import duties; and imports from the ex-German provinces of Poland are similarly privileged for three years (Art. 268). The Allies may impose a special customs regime on the occupied territories "to safeguard the economic interests of the population" (Art. 270). For three years Germany may not raise the import duties on certain commodities (chiefly produced by Belgium and Italy) above the lowest rates to which these commodities were liable before July 31 1914 (Art. 269).

*Treaty of Versailles—Military, Naval and Air Clauses.*—Germany is required to abolish universal compulsory military service (Art. 173); her army is to be reduced, by a fixed date—which was originally March 31 1920, but subsequently altered to Jan. 1 1921—to a maximum total of 100,000 officers and men (Art. 160). The great general staff and all similar organizations are to be dissolved (*ib.*), and associations of all kinds are forbidden to instruct or exercise their members in the use of arms (Art. 177). The standing army is to be composed of volunteers recruited on a long-service system (Arts. 173-5). The stock of arms, munitions and military equipment which Germany may provide for this army is strictly limited; and the manufacture of such materials may only be carried out in factories approved by the Allies (Art. 168). All such materials in excess of Germany's legitimate requirements are to be surrendered within two months after the treaty comes into force (Art. 169). Germany is required to destroy all fortifications on the right bank of the Rhine within a distance of 50 km. from the river, and in the whole of her territory on the left bank (Art. 180). The size of her navy is defined; she may not keep more than 6 battleships, 6 light cruisers, 12 destroyers and 12 torpedo-boats; no submarines are allowed (Art. 181). She is to surrender 8 battleships, 8 light cruisers, 42 destroyers and 50 torpedo-boats (Art. 185), all her submarines (Art. 188), all military and naval aeroplanes and dirigibles (Art. 202). Warships and submarines still under construction are to be broken up. Germany's air forces are to be entirely disbanded by Oct. 1 1919 (Art. 199). The personnel of her navy, including officers, is not to exceed 15,000, and is to be recruited on a long-service system (Arts. 183, 194). The execution of these terms will be supervised by inter-Allied Commissions of Control armed with full powers of inspection and investigation (Arts. 203-210).

*Criticisms of the Treaty.*—One of the earliest critics was Gen. Smuts, who signed the treaty on behalf of South Africa, and on the same day issued a statement in which he spoke of "territorial settlements that will need revision" and "indemnities stipulated which cannot be exacted without grave injury to the industrial revival of Europe." He said that he had signed "because the real work of making peace will only begin after this Treaty has been signed." Mr. J. M. Keynes, till June 10 the chief finance expert of the British delegation, has argued (in his book on *Economic Consequences of the Peace*, published

in Nov. 1919) that the claims of the Allies to reparation have been unjustifiably inflated by claims for separation allowances and pensions to the families of combatants, and for pensions and for compensation money paid to the wounded and disabled; and that the demands made on Germany are out of all relation to her capacity to pay. These points are naturally taken in the German counter-proposals of May 29, which accuse the Allies of desiring to fasten "a system of slave labour" upon Germany. "If," says this document, "they impose upon Germany a debt which robs her of every possibility of a future; if as a consequence every improvement of Germany's economic condition, which the German people might achieve by tireless diligence and Spartan thrift, would lead simply to this, that even greater payments for the discharge of this debt would be imposed upon us, then any delight in creative work, any spirit of initiative, would perish for all time in Germany." The experience of 1920 and 1921 showed that this prophecy was overdrawn, but it has suggested to more recent critics the reflection that the Allies might have obtained more, if they had demanded less. Experience has also shown the unreality of the terrifying picture which the Germans, and also Mr. Keynes, presented of the Reparations Commission as a despotic tribunal created "to exploit the labour of the German people for the benefit of the creditor states." Another subject which frequently recurs in the German note is that of the treatment accorded to German private property in the dominions of the Allies, in Alsace-Lorraine and in the German colonies. They objected to the general policy of liquidation and of referring the expropriated persons to the German Government for compensation. They argued that, by international law, private property ought to have been respected even during the war. They complained that the Allies reserved the right to liquidate German property in their own territories for an indefinite period after the war. They pointed out that Germany could only compensate the sufferers by printing more and more paper money, in which case "Germany with her currency constantly depreciating would be forced to flood the world market with goods at ridiculously low prices." But the greatest emphasis of all is laid on the complaint that the Allies, by the terms of their treaty, are violating the "innate rights of nation." The right of sovereignty is said to be infringed by the powers of the Reparations Commission and of the International Commission appointed to control the navigation of the Elbe, the Oder, the Niemen, the Rhine and the Upper Danube. The seizure of her colonies is represented as meaning that Germany is denied "the right and the duty to coöperate in the joint task which devolves upon civilized mankind of exploring the world scientifically and of educating the backward races." It is further alleged that the right of self-determination has been consistently overridden in the territorial settlement, inasmuch as the fate of the Saar valley (for 15 years), of Alsace-Lorraine, of Danzig and Memel, has been settled without a plebiscite, and Austria is virtually forbidden to throw in her lot with Germany, however greatly the populations concerned desire this union. On the topic of self-determination the Allies showed themselves particularly sensitive in their reply of June 16 1919. This principle, as we have seen, had already caused them some embarrassment; they had not all interpreted it alike; and Mr. Wilson himself had reluctantly waived its application in certain cases which were complicated by economic or strategical considerations. On the other hand the Allies absolutely declined to discuss the categories of damage for which they were demanding reparation, and merely asserted that this part of the treaty had been drafted "with scrupulous regard to the correspondence leading up to the Armistice of Nov. 11 1918."

*The Austrian Treaty Negotiations.*—The drafting of the Austrian treaty was begun some time before the German treaty had been signed, and the Austrian delegates arrived at St. Germain-en-Laye on May 14 1919. But there were unexpected delays in completing the first draft, which could not be submitted to the seventh plenary session until May 29. Even then the military, financial and reparation terms and part of the

political terms were reserved; and in this incomplete form the draft was handed (on June 2) to Dr. Renner, the principal Austrian delegate. On the same day the Serb-Croat-Slovene state (Yugoslavia) was formally recognized by France and Great Britain, who thus at length followed the example set by Mr. Wilson nearly four months before (Feb. 5). Even in its incomplete state the draft showed the great concessions which had been made, at Austria's expense, to Italy and to Czechoslovakia. By May 29 Mr. Wilson had withdrawn his opposition to the Italian claim (under the secret Treaty of London) for a frontier which touched the crest of the Brenner Pass and gave Italy 200,000 German subjects. The draft showed this frontier. It also showed that the 3,000,000 Germans living within the historic boundaries of Bohemia, Moravia and Slovakia were to be included in the Czechoslovak state. Against these arrangements the Austrian delegates protested in vain. They were more successful when they claimed the German districts of western Hungary as being not only German in sentiment but also economically indispensable to Austria ("the kitchen garden of Vienna") and her natural bulwark against unprovoked attacks from the side of Hungary. This claim was granted on July 20, perhaps the more readily because of the defiant attitude of Bela Kun, the leader of the Hungarian Bolsheviks, who was still in possession of Budapest. The Austrian delegates asked the permission of the Conference for a plebiscite in western Hungary, but were told that this formality was needless, the sympathies of the population being unmistakable. Nevertheless western Hungary was still in the hands of the Hungarian Government till the autumn of 1921. A smaller, but still valuable concession, was that which restored to Austria the important railway junction of Radkersburg, originally assigned to Yugoslavia. The draft ordered a plebiscite to be taken in the Klagenfurt basin, which was claimed on ethnological grounds by the Yugoslavs and had been forcibly occupied by Yugoslav troops. Though the administration of the basin was provisionally assigned to Austria, the Austrians appear to have assumed that the plebiscite would be so managed as to ensure the victory of their rivals at the polls; and they lodged some protests on this assumption, which in fact was falsified. When at last the plebiscite was held (Oct. 10 1920), it was found that the whole of the disputed area preferred to remain under Austrian rule.

In the course of the negotiations with the Austrian delegates it became clear that the principal Powers as a whole were far more leniently disposed to Austria than the form of the Austrian draft treaty appeared to suggest. The draft had been constructed on the same lines as the German treaty, and the effect of the Austrian reparation clauses was to convey an impression of greater severity than was in fact intended. As in the German treaty, so in the Austrian, the total sum to be demanded was left uncertain. Austria was required to pay, by May 1 1921, "a reasonable sum" which would be assessed by the Reparations Commission (Art. 181); and her remaining liability was to be defined by that body after that of Germany had been fixed (Art. 179). But, out of the "reasonable sum" to be paid in the first instance, the commission were to pay for any supplies of food and raw material which it deemed essential to Austria; and the Conference soon discovered that Austria was quite incapable of paying, either in gold or in kind, for the relief that she required and received. Austria was obliged to resign all claims to the merchant shipping owned by her nationals. She was required to find a quantity of live stock for the devastated areas of Italy, Yugoslavia and Rumania. But, in 1921, the Allies decided to waive all their outstanding claims against her on account of reparation. This act of grace makes it unnecessary to dwell upon the insistence with which the Supreme Council in 1919 emphasized their right to treat the new Austria—a state of 7,000,000 souls—as the legal heir to the liabilities of the Austrian Monarchy. The chief advantage which the principal Powers derived from this attitude was that of a legal title to dispose of the severed lands of the Austrian Monarchy. These lands the new Austria renounces (under Arts. 36, 47, 53, 50, 89 of the treaty) in favour of the beneficiaries appointed by the

Conference. Similarly she renounces the interests of the old Austria outside Europe (Arts. 95-117).

Several concessions, other than those enumerated above, were notified to the Austrian delegates between June 2 and the date of signature. (1) The Supreme Council promised to support Austria's claim to membership of the League of Nations as soon as she possessed a responsible Government which had both the will and the power to fulfil its international obligations. This promise was fulfilled, and Austria was admitted to the League late in 1920 at a session held in Geneva. (2) The Council also conceded that the property of Austrian nationals in the former territories of the Dual Monarchy should not be liable to detention or confiscation by the Governments of those territories (Art. 267). (3) They sanctioned a temporary system (to last for five years) of preferential customs duties between Austria on the one side and Hungary and Czechoslovakia on the other (Art. 222). (4) They reduced from five to three years the period during which the new states could claim "most favoured nation" treatment in Austria without reciprocity (Art. 232).

The second draft of the treaty was handed to the Austrian delegates on July 20 and was practically complete. The Austrians presented their final observations on Aug. 6; the Supreme Council gave its final reply on Sept. 2. On Sept. 8 the Austrian National Assembly, while protesting against the terms, authorized its delegates to sign; and this ceremony took place at St. Germain-en-Laye on Sept. 10. But Rumania and Yugoslavia refused to sign because by doing so they would have pledged themselves to accept Minorities Treaties, similar in character and intention to that which Poland had signed at Versailles on June 28, under the terms of the German treaty. The argument which the principal Powers stated in defence of the Minorities Treaties was forcibly put by Mr. Wilson at the eighth plenary session (May 31). These Powers could not be expected to guarantee the independence and integrity of the new states, unless the latter would on their side guarantee equality of rights to the minorities, racial or religious, which, under the terms of the peace settlement, were being transferred from the allegiance of ex-enemy Governments. But this argument did not fit the case of Rumania or of Yugoslavia so completely as that of Poland or of Czechoslovakia. Rumania and Yugoslavia were old states, and (though greatly enlarged by the peace settlement) denied the right of the Conference to limit their sovereignty by special stipulations. They might have accepted minority treaties applying exclusively to new territories acquired under the peace settlement; but the Minorities Treaties presented for their signature applied indifferently to old and new territories alike. Eventually they were obliged to give way; but they did not sign the Austrian treaty and the Minorities Treaties until Dec. 10 1919, after receiving an ultimatum from the Conference. The final ratification of the Austrian treaty took place on July 16 1920.

*Summary of Austrian Treaty.*—The new Austria includes the provinces of N. Tirol and Vorarlberg, Salzburg, Carinthia, Styria (N. of the Drave), a strip of western Hungary and Upper and Lower Austria. The treaty reserves for future determination considerable sectors of the frontier on the E. and S.E., but the Klagenfurt plebiscite has settled the most important of the doubtful points in Austria's favour. Unlike Germany, Austria has been obliged to give explicit guarantees of the rights of her minorities; these guarantees may, however, be modified with the assent of a majority of the Council of the League of Nations (Arts. 62-9). Under the military clauses the Austrian army may not exceed a total of 30,000 officers and men, and is to be constituted and recruited by voluntary enlistment (Arts. 119, 120). Stocks of guns, munitions and equipment are restricted as in the German treaty, and surplus stocks are to be surrendered, and no air forces may be maintained. A special section of the Reparations Commission is constituted to assess and to collect the payments due from Austria (Art. 179); it is to include representatives of the United States, Great Britain, France, Italy, Greece, Poland, Rumania, Yugoslavia and Czechoslovakia; but the four first named Powers have two votes apiece,

and thus constitute a majority. Besides the "reasonable sum" to be paid before May 1 1921 (Art. 181), Austria is required to hand over all merchant ships and fishing-boats owned by nationals of the former Austrian Monarchy, and up to 20% of her river fleet; also animals, machinery and equipment, up to the limits of her capacity, for the restoration of devastated territories. Immediate delivery is required of specified quantities of live stock for Serbia, Rumania and Italy. Austria is made liable for so much of the Austrian war debt as is held outside the boundaries of the Austro-Hungarian Monarchy; but she is not liable for war debt bonds which are held by other states, or by their nationals, within those boundaries (Art. 205). All transferred territories of the monarchy are to be liable for their fair share of the pre-war Austrian debt (Art. 203). Austria renounces all claims to the state property, including royal property, lying within the transferred territories; but the states acquiring such property will be debited, and Austria will be credited, with its value by the Reparations Commission (Art. 208). The commercial clauses are similar to those of the German treaty. In the clauses relating to ports, railways and rivers, it is provided that the old Danube commission shall be revived, and that the Upper Danube (from Ulm downwards) shall be controlled by a new commission on which Great Britain, France, Italy, Rumania and the riparian states will be represented (Arts. 301, 302). Austria is guaranteed free access by railway to the Adriatic through the territories and the ports which have been severed from the monarchy (Art. 311).

The Austrian treaty is supplemented by two special agreements which were signed at St. Germain-en-Laye on Sept. 10 1919. By the first of these Poland, Rumania, Yugoslavia and Czechoslovakia agree with the other Allied and Associated Powers to make separate payments, not exceeding in the aggregate 1,500,000,000 gold francs, as a contribution to the costs of liberating the territories which have been transferred to them from the monarchy. By the second Italy agrees to make a similar payment, in consideration of the provinces assigned to her. None of these payments was to be made before 1926.

*The Bulgarian Treaty, Nov. 24 1919.*—The Bulgarian delegates, headed by M. Theodoroff, the Prime Minister, arrived in Paris on July 26, but did not receive the draft treaty until Sept. 19. The terms were not altogether unexpected, for M. Theodoroff had lodged objections against some of them on Sept. 2. But five weeks elapsed before the formal observations of the delegates were presented to the Supreme Council (Oct. 24). The Bulgarians demurred to the terms of the territorial settlement, which were thought by critics on the side of the Allies to be too lenient; they also complained that Bulgaria was harshly treated in not being immediately admitted to the League of Nations. They protested that Bulgaria could not afford to abolish conscription and maintain an army of volunteers, even on the small scale prescribed by the draft treaty. The Supreme Council in their reply (Nov. 3) promised speedy admission to the League, but made no other concession of substance. Further remonstrances from the Bulgarians merely led M. Clemenceau to intimate (Nov. 5) that the treaty as it stood must be either accepted or rejected within ten days. By this time M. Theodoroff had resigned office. His party had been severely defeated at a general election held in Aug., and he shrank from the invidious responsibility of signing the treaty. A new Government was formed by the leader of the Agrarian party, M. Stambolisky; and, on Nov. 13, Bulgaria's acceptance of the inevitable was notified to the Supreme Council. The treaty was signed at Neuilly-sur-Seine on Nov. 27, M. Stambolisky acting as the sole signatory for Bulgaria.

The general principle of the territorial terms is to restore the frontiers of 1914; but Bulgaria cedes to the principal Powers the share of Thrace which had been left to her by the Treaty of Bucharest; the Powers undertake to provide (by arrangement with Greece) outlets for Bulgarian trade on the Aegean. Certain districts are transferred (for strategic reasons) from Bulgaria to Yugoslavia; the most important of these districts contains the town of Strumitza. It is stated that further transferences of

territory to Yugoslavia were considered at the Conference, but were rejected on ethnological grounds as they would have affected districts in which the Bulgarian nationality preponderates. The reparation terms are more definite than those of the German and Austrian treaties. Bulgaria is required to pay 2,250,000,000 gold francs by half-yearly instalments extending over a period of 37 years. An inter-Allied commission of three members (representing France, Great Britain and Italy) will remain in Bulgaria to see that the reparation terms are duly honoured. This body will decide how the half-yearly payments are to be raised. It will prepare a list of the taxes and other revenues which are to be appropriated to reparation. If Bulgaria makes default in respect of any instalment, the commission may assume the duty of collecting the appropriated revenues. The commission may also recommend the Central Reparations Commission to give a time of grace for any particular instalment, or to reduce Bulgaria's liability. Such a recommendation will take effect if it is endorsed by a majority of the Reparations Commission. Bulgaria must provide, by way of restitution, specified quantities of live stock for the devastated areas in Greece, Rumania and Yugoslavia. She must also supply Yugoslavia with 50,000 tons of coal annually for five years. The maximum size of the Bulgarian army is fixed at 20,000 officers and men, raised by voluntary enlistment; but Bulgaria may maintain gendarmes, customs officials, forest guards and some other kinds of police and frontier guards (all armed with rifles) up to the number of 13,000. All Bulgarian war-vessels (including submarines) are to be surrendered or broken up, except four torpedo-boats and six motor-boats. No air forces may be maintained, no submarines may be built or otherwise acquired. The importation of arms and munitions is prohibited; only one munitions factory is permitted. No new fortifications may be constructed in Bulgaria.

*The Hungarian Treaty, June 4 1920.*—The Hungarian delegates did not appear in Paris until Jan. 7 1920, and over six months elapsed before the Treaty of the Trianon was signed. But the main features of this treaty had been settled long before the Peace Conference dissolved. Except in the territorial terms it was closely parallel to the Austrian treaty. The Supreme Council had informed Bela Kun on June 13 1919 what territories would be transferred to Czechoslovakia and Rumania; and on July 20 1919 the German districts of western Hungary were promised to Austria. But some time elapsed before Hungary acquired a Government which commanded the confidence of the Allies. Late in July 1919 Bela Kun was overthrown by the Rumanians, whom he had attacked on the line of the river Theiss. The Rumanians then occupied Budapest, and permitted the Archduke Joseph to assume the title of Administrator, with the support of a number of ex-officers (Aug. 6). The Archduke applied to the Supreme Council for recognition; but the Council insisted that he should resign, and that steps should be taken to form a coalition Government (Aug. 22). The Archduke then effaced himself, but his Premier, M. Friedrich, remained in office until the Rumanians evacuated Budapest in November. At last on Nov. 24 a coalition Government was formed under M. Huszar, and M. Friedrich joined the new Cabinet as Minister for War. M. Huszar was promptly recognized by the Supreme Council (Dec. 1), in spite of the fact that the strength of his position had not yet been tested by a general election. This, however, took place early in 1920 and produced a National Assembly whose sentiments were comparatively reasonable. The draft treaty was handed to the Hungarian delegates on Jan. 15 1920, a week before the termination of the Conference; the negotiations were left to be conducted by the Council of Ambassadors. On Feb. 12 the Hungarians presented counter-proposals and observations which were the reverse of conciliatory. They argued that the position of the Magyars in Hungary was an exact parallel to that of the Czechoslovaks in Bohemia, and asked why the principle of self-determination had been differently applied to the two cases. They asked that the Szeklers of E. Transylvania should be left under Hungarian rule; that all the territories which Hungary was required to

surrender should remain within the Hungarian customs régime for a period of years; that no territories should be transferred without a plebiscite, or, alternatively, that better safeguards should be provided for the rights of Magyar minorities. These requests came too late for serious consideration. All the ambassadors would promise was that the League of Nations should be free to consider any minor rectifications of boundaries which the frontier commissions might recommend on ethnological or economic grounds. It is remarkable that this reply, which only involved small alterations in the draft treaty, was not transmitted until May 6. There was one Hungarian pretension with which the Allies dealt more promptly. The Huszar Government claimed that Hungary was still a monarchy, though the royal dignity was in suspense; it was no secret that many Hungarians still desired a Habsburg dynasty. But on Feb. 2 1920 Great Britain, France and Italy declared that a Habsburg restoration in Hungary would violate the fundamental principles of the peace settlement. The Hungarian royalists did not even then abandon all hope; the monarchical character of the constitution was reaffirmed by the Government on March 23. But since the signature of the Treaty of the Trianon the three states of Czechoslovakia, Yugoslavia and Rumania have combined in a "Little Entente" which avowedly exists to defeat any Hungarian project for a Habsburg restoration.

The only parts of the Hungarian treaty which call for comment are those which fix the future boundaries of Hungary and the allocation of the transferred provinces. On the N. the new frontier gives to Czechoslovakia the southern slopes of the Carpathians, mainly though not entirely populated by Slovaks. To provide Czechoslovakia with a frontage on the Danube and to secure the economic unity of the Carpathian territories, the frontier line has been so drawn as to place large Magyar populations under Czechoslovak rule. Similarly Rumania receives not only Transylvania, in the E. of which there is a compact Magyar (Szekler) minority, but also a broad strip of the Hungarian plain to the W., in which the chief towns are Magyar, in order that Transylvania's railway communications with the Danube may be adequately secured. The Banat, which is divided between Rumania and Yugoslavia, has a mixed population, predominantly Slav in the western and predominantly Rumanian in the eastern half of the province. The German element in the eastern Banat is considerable and would no doubt have preferred to remain under Hungarian rule. But the chief difficulty which the Conference experienced in dealing with the Banat was the adjustment of the conflicting claims of Yugoslavia and Rumania. For the Allies, in their secret treaty of Aug. 1916 with Rumania, had promised her the whole of the Banat, without regard to the historic claims of Serbia. At the Conference M. Bratianu pressed for the fulfilment of the secret treaty. He was met with the reply that Rumania herself had cancelled it by making peace with the Central Powers in May 1918; but he continued to reiterate his demands until the terms of the partition of the Banat were irrevocably settled by the Conference and announced to the world (June 13 1919). To this incident were due the Rumanian occupation of Budapest, the intrigue with the Archduke Joseph (which seems to have included a plan for the union of the Rumanian and Hungarian crowns) and the delay of Rumania in signing her Minorities Treaty.

Like Austria, Hungary is precluded from alienating her independence, except with the consent of the Council of the League of Nations (Art. 73). She is required to pay a reasonable sum, fixed by the Reparations Commission, before May 1 1921; her total liability will be fixed by the same body (Arts. 163, 165) and the balance is to be paid in half-yearly instalments over a period of 30 years, unless payment is respite or remitted by the Allies. She is to surrender all her merchant shipping, up to 20% of her river fleet, and an indefinite quantity of live stock (at the discretion of the Reparations Commission) for devastated countries.

*The Adriatic Question.*—When the Italian plenipotentiaries reappeared at Paris in May 1919 they were offered by the

American delegation the so-called Tardieu Compromise, under which Fiume and its hinterland would have constituted an independent state for 15 years, and a plebiscite would afterwards have been taken to ascertain the views of the inhabitants. To this compromise, it is alleged, Sig. Orlando gave his consent; but the Yugoslav delegates insisted on unacceptable amendments, and the American attempt at mediation was dropped at that time. Subsequently the Italian poet D'Annunzio, at the head of a band of volunteers, occupied Fiume (Sept. 12) while fresh negotiations were in progress (at Washington) between Mr. Wilson and the Italian Government. In spite of this *coup d'état*, which was disavowed by Italy, the American negotiations continued; by Oct. 27 Italy had agreed that Fiume should be a free state under the protection of the League of Nations and had resigned her claims on Dalmatia, while Mr. Wilson was prepared to recognize Italy's sovereignty over the Pelagosa group, Lissa, Lussin, Unie and the port of Valona. The Adriatic position was then examined more minutely at Paris by M. Clemenceau, Sir Eyre Crowe and Mr. Polk. These three proposed that Italy should be offered a protectorate over the Dalmatian city of Zara, but that she should be asked to abandon her demands upon the isle of Lagosta and the eastern part of Istria, and also her proposal that the city of Fiume should be made independent of the free state of Fiume. The offer did not satisfy Sig. Nitti, who intimated that Italy, in default of a more acceptable scheme for a compromise, would take her stand on the secret Treaty of London. To this Mr. Lloyd George and M. Clemenceau replied that they too were willing in the last resort to abide by that treaty, but on Jan. 14 1920 they offered new terms which were distinctly more favourable to Italy than those of Dec. 9 1919. The new terms were drafted after Mr. Polk had left Paris for Washington, and were presented to Sig. Nitti before the U.S. Government had been consulted regarding them. Accordingly Mr. Lansing intimated, on Jan. 20, that Mr. Wilson could not admit the right of France and England to modify, on their own responsibility, the only terms of compromise to which an American representative had subscribed. The French and British Prime Ministers argued, in reply, that their new proposals were actually more favourable to Yugoslavia than those of Dec. 9, and were intended to save France and England from the necessity of honouring the Treaty of London, to which, as was notorious, Mr. Wilson had always objected. But on Feb. 10 Mr. Wilson stated precisely his objections to the terms of Jan. 14. They gave to Italy the whole of Istria and the prospect of a future protectorate over Fiume. They also provided for the partition of Albania between Yugoslavia, Italy and Greece. Mr. Wilson stated that he could not coöperate with the European Allies if they allowed the admitted principles of justice to be overborne "by the country possessing most endurance in pressing its demands." The upshot of the controversy was that Italy and Yugoslavia were left to settle their differences, if they could, by separate negotiations, with the proviso that they must not come to terms at the expense of Albania. It took some time to reach this consummation. But on Nov. 12 1920 Italy and Yugoslavia concluded the Treaty of Rapallo, and on Jan. 2 1921 D'Annunzio's garrison at Fiume surrendered to the Italian Government. Albania, thanks to Mr. Wilson's intervention, has established an independent Government and has been admitted (Dec. 17 1920) as a member of the League of Nations. The Adriatic question was thus provisionally settled, nearly a year after the close of the Conference, but still on lines which the Conference had suggested.

*The Turkish Treaty.*—The Turkish question was discussed at Paris in May and June 1919, but the drafting of the Turkish treaty was not seriously taken in hand until the London Conference of Feb. 1920. This delay was due partly to the hope (unhappily falsified) that the United States would join in the treaty; but also to difficulties arising out of the allocation of mandates for the non-Turkish portions of the Ottoman Empire. The twelfth of the Fourteen Points provided that these territories should receive "unmolested opportunity of autonomous development." Article 22 of the Treaty of Versailles indicated

that some at least of them would be recognized as independent nations, under such mandates as they were willing to accept. The principal claimants for these mandates were France and Great Britain, who in May 1916 had come to an understanding about their future spheres of influence (the Sykes-Picot agreement), on the basis that the French sphere should include Cilicia, Southern Armenia and Syria (with autonomy under French protection for Damascus, Aleppo, 'Urfa, Deir and Mosul); that Palestine should be an international territory; and that Haifa and Mesopotamia should be in the British sphere. But Greece claimed the whole of Turkish Thrace, Smyrna (which she occupied with the approval of the Supreme Council in May 1919) and the Aegean Is.; while Italy claimed the Dodecanese (of which she had retained possession at the end of the Libyan war in 1912) and a sphere of influence on the adjacent mainland. There were difficulties connected with all these claims. The most notorious conflict of interests was that between France and the Hejaz (over the Arab districts of Syria), which came to a head in March 1920 with the proclamation by a "Syria National Congress" of an independent Syria (to include the Lebanon, Palestine and Mesopotamia) and of Faisal, the heir apparent of the Hejaz, as the king of this state; but there were also doubts as to the wisdom of allowing Greece to assume responsibility for Smyrna, and as to the possibility of reconciling the French and Italian claims with Mr. Wilson's promise to respect the political unity of the Turkish race. The future of Constantinople was long in doubt. At last on Feb. 16 1920 the Conference of London announced that it would remain the Turkish capital; but, a month later, the Allies informed the Turkish Nationalists that this concession was conditional on their good behaviour, and Constantinople was temporarily occupied by Allied troops under the command of Gen. Milne. On April 24 the Conference of San Remo gave mandates to France for Syria, Cilicia and the Lebanon; to Great Britain for Palestine and Mesopotamia; a mandate for Armenia was declined first by the League of Nations (April 27) and afterwards by the United States Senate (May 27). At last on May 11 the draft treaty was handed to the Turkish delegates at Sèvres. Its terms produced considerable excitement among the Nationalists, and it was necessary for the Allies to call upon the Greeks to make armed demonstrations both in Asia Minor and in Thrace. But at the Conference of Spa (July) the last touches were put to the treaty and on Aug. 10 it was duly signed by the Turkish delegates.

Under the treaty Constantinople is left to the Sultan, with the proviso that it may be forfeited if Turkey violates the terms of settlement, especially those by which she guarantees the rights of minorities in her territory. In accordance with the Fourteen Points the Straits are neutralized and placed under the control of an international commission. Smyrna, with about half its *vilayet*, is left under Turkish sovereignty, but this sovereignty will be exercised by the Greek Government, and Smyrna may be incorporated in the Greek customs area. There is to be a local legislature, which may, if it so desires, petition the League of Nations (within five years) for the incorporation of Smyrna in the Greek kingdom. Greece also receives, in full sovereignty, Thrace outside the zone of the Straits, Imbros, Tenedos, Lemnos, Samothrace, Mytilene, Chios, Samos and Nikaria. But she may not fortify the first five of these islands (owing to their proximity to the Straits); and she engages to sign a minorities treaty. Armenia is declared a free and independent state; the boundary between Turkey and Armenia is to be referred to the arbitration of the President of the United States. Syria, Mesopotamia and Palestine are recognized as independent states; their boundaries will be fixed by the principal Powers, and they are to be administered by mandates, on terms formulated by the principal Powers and submitted to the Council of the League of Nations for approval. The Hejaz is recognized as a free and independent state. Turkey cedes to Italy the islands of Astrolalia, Casso, Scarpanto, Rhodes, the Dodecanese and Castellorizo. The British protectorate over Egypt and the British annexation of Cyprus are confirmed. The chief feature of the

military clauses is the proviso that Turkey may maintain no military forces except the Sultan's bodyguard, and gendarmes and frontier guards not exceeding 50,000 in number. The Allies waive their claims for reparation. But Turkey is to pay the costs of the armies of occupation since the Armistice of Oct. 30 1918, and to compensate civilian nationals of the Allies for loss or damage suffered in the war through the action or negligence of the Turkish authorities.

**BIBLIOGRAPHY.**—All the treaties have been published by the Stationery Office. Supplementary documents are printed in the *History of the Peace Conference*, vols. I-III, ed. H. W. V. Temperley (1920-1), which also comments exhaustively on the German treaty, and gives an account of proceedings up to June 28 1919. Three more volumes are in preparation; these will deal with the remaining treaties. A few more documents will be found in the *American Journal of International Law* (and supplements) for 1919 and 1920. The German *Comments on the Conditions of Peace* of May 29 1919 is published (in English) by the Amer. Assoc. for International Conciliation (Oct. 1919); the *Reply of the Allied and Associated Powers*, of June 16 1919, is published by the Stationery Office: Cmd. 258 (1919). For the question of Fiume see documents published by "Adriaticus" in *La Question Adriatique* (1920), and the Stationery Office paper: *Correspondence relating to the Adriatic Question*, Cmd. 586 (1920). Of books describing or criticizing the Conference the following are useful: Sir M. Hankey, "Diplomacy by Conference" (*Proc. Brit. Inst. of International Affairs*, 1921); H. Wilson Harris, *The Peace in the Making* (1920); J. M. Keynes, *Economic Consequences of the Peace* (1919); C. H. Thompson, *The Peace Conference Day by Day* (1920). Of capital importance is the series of articles by M. André Tardieu in *L'Illustration* for 1920, reprinted in his book *La Paix* (1921). See also R. Lansing, *The Peace Negotiations* (1921) and *The Big Four and Others* (1921). (H. W. C. D.)

**PEARCE, CHARLES SPRAGUE** (1851-1914), American painter (see 21.24), died in Paris, France, May 18 1914.

**PEARS, SIR EDWIN** (1835-1919), British lawyer and man of letters, was born at York March 18 1835, and educated privately and at the London University where he took first-class honours in Roman law and jurisprudence. He was called to the bar at Middle Temple in 1870 and for a time was private secretary to Frederick Temple, afterwards archbishop of Canterbury, and secretary to various associations connected with social work in London. In 1873 he settled in Constantinople, practising in the consular courts and becoming president of the European bar there. He acquired in this way an intimate knowledge of the East which he turned to account in 1876 when, as correspondent of *The Daily News*, he sent letters home describing Moslem atrocities in Bulgaria which aroused popular demonstrations in England led by W. E. Gladstone (see 12.71). He was knighted in 1909. His works include *The Fall of Constantinople, a Story of the Fourth Crusade* (1885); *The Destruction of the Greek Empire* (1903), and his most distinguished book, *Turkey and its People* (1911) in which he displayed his expert knowledge of Byzantine Constantinople. He died Nov. 27 1919 at Malta as the result of an accident on his journey home from Constantinople.

**PEARSE, PATRICK HENRY** (1879-1916), Irish educationist, author, and Sinn Féin leader, was born in Dublin on Nov. 10 1879. His father was an Englishman, a sculptor and worker in stone, who was himself the author of a pamphlet on *England's Duty to Ireland as it appears to an Englishman*. It is likely that it was from his father Pearse derived his love of liberty; and from his mother, whose people came from county Meath, he drank in memories of '08 and of the Fenians. He was educated at the Christian Brothers schools and graduated before he was 24 at the Royal University of Ireland as a B.A. and B.L. His first serious work was when he became editor of the *Claidheamh Solais*, the weekly organ of the Gaelic League. When engaged on this work he made a tour through Belgium to study bilingual methods, and edited several *Fiana* tales from Irish manuscripts. He was a hard worker on the *Coisde Gnotha* or Executive of the League, and secretary to its publication committee. He was more interested in education than in any other subject, and it is remarkable that he was in favour of accepting Mr. Birrell's Irish Council bill (see 14.788) in 1907, because it gave the Irish control over their own education. In this attitude he stood almost alone. His first book was a slender volume containing *Three Lectures on*

*Gaelic Topics*, published when he was only 19, dedicated to the New Ireland Literary Society (an ephemeral body which he himself had founded) by its President. This little book contained the germs of much later and better work, including a plea for enthusiasm, and a prophecy that the Gael would "become the saviour of idealism in modern intellectual and social life." In order to carry out his educational schemes he founded a school at Cullenswood, in Dublin, which prospered. The idea was to give an Irish education such as he assumed would be given in a free Ireland. Much stress was laid on the Irish language and on religion. In 1910 he removed this school to the Hermitage, Rathfarnham, a few miles out of Dublin, and continued to run it until his death. He travelled in America collecting money for his schemes, and on his return threw himself into the Irish Volunteer movement. He was high up in its councils, and led in the revolution of 1916, of which he was commander-in-chief. At the same time he proclaimed an Irish Republic. After a week's fighting in Dublin he saw that further resistance was useless, and ordered the Volunteers to lay down their arms. He and Thomas MacDonagh, who had formerly been one of his assistant masters at the Hermitage, and other leaders were tried by court-martial and shot soon after their surrender. Pearse was an excellent orator, with a fine resonant voice. He was a pious Catholic, of irreproachable life, a great lover of children and of nature.

After his death appeared *The Collected Works of Padraic H. Pearse* (3 vols. 1917), containing plays, poems and stories in Irish, and one volume of English writing. (D. Hy.)

**PEARSON, SIR (CYRIL) ARTHUR** (1866-1921), English newspaper proprietor and philanthropist, was born at Wokeay, near Wells, Feb. 24 1866, and was educated at Winchester. He early founded the business of C. Arthur Pearson, Ltd., newspaper proprietors and publishers; and after having made large profits with *Pearson's Weekly* and other periodicals he founded in 1900 the *Daily Express*, a halfpenny rival to the *Daily Mail*, and in 1904 purchased the *Standard* (see 19,560, 561). He was a strong supporter of Mr. Chamberlain's tariff-reform movement. In 1910 increasing—later complete—failure of sight obliged him to retire from the active direction of newspapers. Henceforth he devoted himself and his fortune with whole-hearted industry to efforts to ameliorate the condition of the blind. During the World War he established at his house, St. Dunstan's, in Regent's Park, London, a hospital for blinded soldiers, and became chairman of the Blinded Soldiers and Sailors Care Committee (1914). He also became president of the National Institution for the Blind. He was created a baronet in 1916 and G.B.E. in the first gazette of the new Order of the British Empire in 1917. He died in London Dec. 9 1921. Having been eager to encourage those among the blind who cannot command attendance, he had made it his practice to have his bath unaided, but on this occasion he accidentally slipped, was stunned by striking his head on a tap and suffocated while unconscious, his face under water.

**PEARY, ROBERT EDWIN** (1856-1920), American Arctic explorer (see 21,30), died in Washington, D.C., Feb. 20 1920. Because of his discovery of the North Pole (1909) he was promoted rear-admiral in 1911 and received by special Act the thanks of Congress. The same year he was U.S. delegate to the International Polar Commission in Rome. During his later years he was much interested in aerial navigation and delivered many addresses in which he urged coast patrol by aeroplanes. In 1913 he was made Grand Officer of the Legion of Honour (France). He was the author of *The North Pole* (1910) and *Secrets of Polar Travel* (1917).

**PEEL, ARTHUR WELLESLEY PEEL, 1ST VISCOUNT** (1829-1912), English statesman (see 21,39), died at Sandy, Beds., Oct. 24 1912.

He was succeeded by his son, **WILLIAM ROBERT WELLESLEY PEEL**, who in 1916 was chairman of the Committee on Detention of Neutral Vessels, in 1919 became Under-Secretary for War, and in 1921 Chancellor of the Duchy of Lancaster.

**PEKING, China** (see 21,61).—During the first decade of the new Chinese Republic, great improvements were made in the

matter of the maintenance, lighting and sanitation of the principal thoroughfares of the capital; the police were reorganized on western lines, and instructed in traffic control; and, as the result of the introduction of metalled roads, the old-type mule cart was rapidly replaced by carriages, motor-cars and jinnikishas. Many of these changes were due to the initiative of Chu Chi-chien, Minister of the Interior in 1913.

The conditions of railway traffic between the city and the outside world were also greatly improved by the location of the termini of the Peking-Moukden and Peking-Hankow lines at the Chien Mén, the great southern gate of the Tatar city, which lies between the palace and the Temple of Heaven. The wall adjoining this gate has been pierced with new passages for general traffic and broad thoroughfares thrown open to the public in the Forbidden City.

A large number of buildings in foreign style have been erected for Government offices, banks and business premises. In spite of these changes, however, chiefly conspicuous in the official and business quarters in the vicinity of the legations, the general features of the scene which the traveller sees from the walls remain much the same as in former times, a vast enclosure within which the yellow-tiled roofs of palaces and temples emerge here and there above the trees; and in the less frequented parts of the city, notably the Manchu quarter, there is but little outward evidence of change. The poverty-stricken appearance which the Chien Mén district and other business centres presented as the result of the destruction wrought by the Boxers in 1900 has gradually disappeared.

The trade of the city remains local as of old, and generally unconcerned with industrial enterprise, but during the first ten years of the Republic the citizens of the capital were able to recover a considerable measure of comfortable prosperity, because of the freedom with which money was circulated by the various political and military parties.

New macadamized roads running from the city in several directions (to the western hills, to Tongshan and to Tungchow) are amongst the most conspicuous manifestations of the Peking municipal council's activities. The number of foreigners resident at the capital has increased considerably in recent years, and, although the city has not been opened by treaty to foreign trade, a number of business houses have been established with the tacit consent of the Chinese authorities.

See E. Backhouse and J. O. P. Bland, *Annals and Memoirs of the Court of Peking* (1913); D. Mennie and P. Weale, *The Pageants of Peking* (1921); P. H. Kent, *The Passing of the Manchus* (1912); J. O. P. Bland, *China, Japan and Korea* (1921).

**PÉLISSIER, HARRY GABRIEL** (1874-1913), English comedian, was born at Finchley in 1874. His father was a Frenchman living in England—a descendant of Marshal Péliissier—and his mother was English. In 1911 he married Fay Compton, the daughter of Edward Compton, the actor. He became an "entertainer" and author of musical sketches and organized a troupe known as "The Follies," who gained a very great success in a special genre of musical entertainment, half song, half witty parody, at the Apollo theatre, London. He died in London Sept. 25 1913.

**PELLETAN, CHARLES CAMILLE** (1846-1915), French politician and journalist (see 21,69), died June 4 1915.

**PENLEY, WILLIAM SYDNEY** (1852-1912), English actor (see 21,99), died at St. Leonards-on-Sea Nov. 11 1912.

**PENNSYLVANIA** (see 21,105).—During 1910-20 there was a great increase in the industrial developments of Pennsylvania, largely as a result of the World War. From 1914 until American participation in 1917, the Allied Governments expended many millions of dollars among the steel, ammunition and other establishments, bringing to the state a period of prosperity the extent of which was apparent when the Liberty Loans and war taxes disclosed the accumulated wealth. The state maintained its rank as the second state in population and in industry.

The pop. of the state in 1920 was 8,720,017, an increase of 1,054,006 over 1910. The rate of increase, 13.8%, was considerably lower than that of the preceding decade, 21.6%. In 1920 the pop. of the 15 largest cities of the state was: Philadelphia, 1,823,158; Pittsburgh, 588,193; Scranton, 137,783; Reading, 107,784; Erie, 93,372; Harrisburg, 75,917; Wilkes-Barre, 73,833; Allentown, 73,502; Johnstown, 67,327; Altoona, 60,331; Chester, 58,030; Lancaster, 53,150; Bethlehem, 50,358; York, 47,512; and McKeesport, 46,781.

*Agriculture*.—A decrease of nearly \$100,000,000 in the value of crops from 1919 to 1920 was reported by the state department of agriculture, but the state's farms showed an improvement in

production during the preceding decade. The contrast is shown in the following table:—

	1909	1920
Wheat	26,265,000 bus.	26,774,760 bus.
Indian Corn	48,800,000 "	65,755,660 "
Oats	25,948,000 "	44,858,325 "
Buckwheat	5,665,000 "	4,952,860 "

The depreciation in the value of crops from 1919 to 1920 was due in part to reduced acreage, but chiefly to the heavy decline in prices. The average farmer in 1920 lost \$134.20 as a result of depreciation. The price of the average dairy cow during the year dropped from \$96.75 to \$75.50, the dairy industry alone depreciating \$2,890,774. Sheep depreciated \$3.75 a head, falling from \$10.25 to \$6.50, and the total loss to sheep-raisers was \$4,000,000. Hogs declined from \$30.90 to \$16.15 and farm horses from \$111 to \$102. The potato production for the entire state for 1920 was 29,158,435 bushels. The state department of agriculture valued the total fruit production of 1920 (20,825,000 bus.) at \$18,742,500.

**Mineral Production.**—The following table shows the figures of the coal and coke industry during 1910-8, in tons:—

	Bituminous	Anthracite	Coke
1910	148,770,858	83,683,994	23,722,944
1911	142,189,329	90,917,176	19,084,320
1912	160,830,492	84,426,860	24,682,474
1913	172,965,659	91,626,964	24,718,238
1914	145,884,530	91,189,641	17,164,124
1915	157,420,068	89,377,706	22,012,945
1916	169,123,814	87,680,198	26,428,926
1917	171,074,411	100,445,299	23,240,777
1918	177,217,294	99,445,794	27,157,373

During these years an average of 190,000 persons were engaged in mining bituminous coal and 170,000 in mining anthracite.

**Manufactures.**—In the absence of final industrial figures for the U.S. census of 1920, not yet available in Dec. 1921, comparisons between the industries of 1909, 1914 and 1919 must be drawn from U.S. census figures for the first two periods and the survey made by the state department of internal affairs for the latter. In 1914 Pennsylvania became the foremost state in the value of silk production, displacing New Jersey. Her 1914 production was valued at more than one-third of the total for the United States, and the state had more than two-fifths of all the employees in the industry. In 1909 226 silk-producing establishments, with 36,469 employees, had a production valued at \$62,061,000. In 1914 284 establishments, with an average of 44,755 wage-earners, produced material valued at \$86,938,554. In 1919 347 establishments, with 57,079 employees, produced material valued at \$238,422,600. Pennsylvania was the leading state in 1914 in hosiery manufacture, reporting 39.7% of the national quantity and 41.2% of the national value. In 1909 464 establishments manufacturing hosiery, employing 38,206 hands, produced a value of \$40,658,000; in 1914 408 establishments, with 41,130 employees, produced a value of \$64,163,449; in 1919 328 establishments, with 35,400 employees, \$130,167,800. In the iron and steel industry in 1909 66 blast furnaces, with 14,521 employees, yielded \$168,578,000, and in 1914, 52 with 11,518 employees a product valued at \$135,806,067. Notwithstanding the decrease the state in 1914 employed 39.2% of all the wage-earners and produced 42.8% of the total product of the country. Steel works and rolling mills in 1914 also showed a decrease from 1909. In 1909 189 establishments, with 126,911 employees, produced \$500,344,000, and in 1914 178 establishments, with 131,955 employees, produced \$488,106,324. In the manufacture of tin-plate, Pennsylvania in 1914 led the nation. Comparative figures show:—

	Establishments	Employees	Product
1909	17	2,346	\$ 25,234,066
1914	13	2,368	36,795,990
1919	8	12,311	115,642,390

The state census of 1919, for all industries, shows a total of 20,888 establishments in the state divided as follows:—buildings and contracting, 2,895; chemicals and allied products, 768; clay, glass and stone, 583; clothing, 1,398; food and kindred products, 2,404; leather and rubber goods, 395; liquors and beverages, 453; lumber and its remanufacture, 1,114; paper and printing, 1,740; textiles, 1,024; laundries, 273; metals and metal products, 3,432; mines and quarries, 1,564; public service, 1,005; tobacco and its products, 709; and miscellaneous, 1,131. The total average number of employees was 1,691,171 (167,562 salaried employees, 1,523,609 wage-earners); the total wages, \$2,176,449,100, and the total value of products, \$8,853,047,600. The highest valuation was placed on metals and metal products, \$3,675,971,500, more than 40% of the whole value of production. Employees in this industry numbered 508,311. Next was a product of \$722,515,300 from the mining industries, which employed on an average 329,179 men in 1919. The textile industry maintained third place with 125,291 employees and a production valuation of \$646,683,000. The figures from 1915-9 are as shown in the following table.

XXXII.—2

	Establishments	Average No. Wage-Earners	Value of Production
1915	22,359	1,503,188	\$4,180,790,500
1916	20,964	1,735,543	6,419,410,000
1917	22,101	1,802,813	8,336,984,800
1918	21,158	1,827,101	9,403,366,600
1919	20,888	1,523,609	8,853,047,600

**Education.**—Two progressive steps a decade apart mark the development of the public schools. The first was the adoption of the School Code of May 18 1911; the second the enactment of what is known as the Finegan programme (named after the State Superintendent of Public Instruction) by the Legislature of 1921. The School Code of 1911 was virtually a codification of all the laws governing the public-school system and a general unification, with many new features, of administrative measures. Its most important sections provided for independent control of taxation and borrowing by school boards with minimum and maximum tax rates varying according to the size of the school district; reduction of the number of members in school boards so as to simplify official business; establishment of a State Board of Education; establishment of a state school fund, and general provisions for the better selection of text-books and for the development of higher education. The measures of 1921 (the Finegan programme) are as follows: (1) Providing that after Sept. 1 1927 those persons who enter the teaching service must show evidence of graduation from a state normal school or an equivalent education and training; (2) requiring fourth-class districts to maintain schools for 150 days in 1921-2 and 160 days in 1922-3; (3) increasing the qualifications of county superintendents by providing that no one except college-trained persons or normal-school graduates with certain school experience shall be qualified for the position; (4) increasing the salaries of all assistant county superintendents from \$1,800 to \$2,500 per year and giving most of the county superintendents an increase in salary of \$500 or \$1,000; (5) establishing a state-wide salary schedule for teachers, fixing the minimum at \$1,200. In cities annual increments are required, and proportionately higher salaries are provided for high-school teachers; (6) increasing the state aid to schools for each biennial period from \$24,000,000 to \$36,000,000 and establishing a new basis of apportionment; (7) encouraging consolidation by providing that for each school closed the district shall be entitled to receive an annual allotment of \$200; (8) making sufficient appropriations for normal schools so that they may be supported without tuition fees and providing a salary schedule for the faculties; (9) creating a State Council of Education to consist of nine business and professional men and women, replacing the State Board of Education and the college and university council; (10) standardizing the elementary courses in public and private schools and requiring that they be taught in the English language and from texts written in English; (11) strengthening the compulsory attendance laws.

**Finance.**—The revenues of the state more than doubled from 1909 to the end of 1920. The receipts in 1909 were \$28,945,210; in 1920, \$62,071,293.97. This does not include \$11,800,000 derived from the sale of state road bonds, a fund kept separate from the regular state moneys. Governor Sproul recommended to the 1921 session of the state Legislature an increase of about 10% in the tax on manufactures and a small tax on mined coal, a combination which would add more than \$30,000,000 to the treasury annually. The treasury disbursements in the fiscal year 1920 were \$74,960,112.20; the highest ever known. The total was \$18,000,000 higher than in 1919, the increase being due to road construction. During the 1920 season approximately 410 m. of concrete state road were built, and 350 m. were under construction in 1921. In two years, 660 m. of 18-ft. concrete roadway, some of which had a brick wearing surface and some asphalt, were constructed by the state. In 1920 a total of 337 m. of macadam highway were resurfaced and 1,400 m. of highway had surface treatment. The maintenance force of the State Highway Department in March 1921 was keeping up 9,503 m. of roadway, of which 463 m. were in boroughs and on state-aid roads. The total resources in 1919 of all the banking institutions within the state, whether organized under national or state laws, were \$4,529,919,000. Of these the state banks had resources in 1920 of \$3,615,244,850, divided as follows: savings banks, \$314,256,637; banks of deposit, \$331,759,257; trust companies; banking resources, \$1,380,919,028; trust funds, \$1,578,424,021; trust funds in banks, \$9,885,906.

**Constitutional Changes.**—The first two constitutional amendments of the decade ending 1920, adopted in 1911 and 1913 respectively, had to do with the courts, the one of 1911 increasing the number in Philadelphia county and merging those in Allegheny county, the one of 1913 altering the judicial and municipal terms to conform with an amendment of 1909 which changed the date of the elections from Feb. to November. Another amendment of 1913 enabled municipalities, except Philadelphia, to embark upon the construction or acquisition of waterworks, subways, etc., even though their cost brought the indebtedness above the limit allowed, and permitted arrangement whereby the interest and sinking-fund charges were paid from the principal until the properties should have been completed and in operation for one year. A limit of 10% of the assessed valuation of taxable property in a municipality was fixed for such indebted-

ness, three-fifths of the electors of the municipality having first to give their assent to the increase. On Nov. 2 1915 the people voted on four proposed amendments and adopted three of them. The first and the most important prepared the way for workmen's compensation. The second enabled Philadelphia to increase its borrowing capacity under conditions similar to those set forth in the amendment of 1913. The third enabled the general assembly to enact laws providing a system of registering, transferring, insuring and guaranteeing land titles by the state or the counties. Amendments passed by the Legislature in 1915 and 1917 were approved by the voters in 1918, one enabling the state to issue bonds to the amount of \$50,000,000 for the improvement of highways, and the other enlarging Philadelphia's borrowing capacity by removing the previous restrictions which confined its increased indebtedness to the construction or acquisition of waterworks, subways, etc. An amendment approved at the general election in 1920 enabled the assembly to levy "graded or progressive taxes." The result of these numerous amendments was manifest in the session of 1919, when a bill was passed authorizing the governor to appoint a commission to study the constitution with an eye either to general revision or to amendment by sections. This commission held public hearings during 1920 and prepared a report to be placed before the session of 1921.

**Legislation.**—The number of boards, commissions, etc., functioning under the state government was greatly increased between 1910 and 1920. The Legislature in 1911 created a Bureau of Professional Education under the State Department of Public Instruction, its purpose being to regulate the education of physicians, dentists and pharmacists. The same year a State Board of Education was created, composed of six members, to report and recommend legislation needed to increase the efficiency and usefulness of the public-school system, to equalize educational advantages in all sections of the state, to inspect schools supported in part or in whole by the state, to encourage vocational training, to improve sanitary conditions and to promote physical and moral welfare. A Bureau of Medical Education and Licensure, under the Department of Public Instruction, was also created by Act of 1911, to examine into conditions in the medical schools and conduct the examination of students applying for state licenses. In 1911 the office of state fire marshal was created, with general powers of investigation over all fires in the state and means of fire prevention. Another important change of 1911 was the reorganization by legislative enactment of the State Highway Department and the undertaking of an extensive system of highways to be built and maintained entirely from state funds.

In 1913 the Department of Labor and Industry was created, with the power to enforce the "laws relating to the safety, health and prosperity of employees and the industries." Under it were formed the bureaus of Inspection, Hygiene and Engineering, Statistics and Information, Mediation and Arbitration, Employment, and also an Industrial Board. A Workmen's Compensation Board was created, the state was divided into districts and the administration of compensation carried on through referees and members of the board. A State Workmen's Insurance Board was created the same year for the purpose of administering the insurance fund provided in the Workmen's Compensation Act. In the meanwhile the Legislature in 1913 did away with the old State Railway Commission and substituted a Public Service Commission, with powers far greater than those of its predecessor, and having jurisdiction over "all railroad, canal, street railway, stage line, express, pipe line, ferry, common carriers," etc., companies "doing business within the state."

The year 1915 saw the reorganization of the Department of Agriculture with the creation of a Commission on Agriculture to appoint all officers and employees of the department and prepare the budgets of the department and of the State Live Stock Sanitary Board. Other new boards of that year were the one on vocational training under the Department of Public Instruction; the Board of Censors, upon all motion pictures; the Prison Labor Commission, to supervise the manufacturing industries of inmates of penal institutions; and the Veterinary Medical Examining Board. The Bureau of Municipalities under the Department of Labor and Industry was a development of 1917 intended to classify and make available statistics and other information tending to improve the government of municipalities. Five boards were created the same year: the State Military Board which has the power to grant pensions not exceeding \$12 per month to widows or minor children of national guardsmen killed on active duty while under the direction of the governor; the Board of Pharmacy; the Board of Optometrical Education, Examination and Licensure; the Board of Commissioners on Uniform State Laws and the Public School Employees' Retirement Board. The Legislature of 1917 also created a Commission on Public Safety and Defense, to which was appropriated \$2,000,000 and which functioned during the two years of American participation in the World War, partly independently and partly through the State Committee of Public Safety and Council of National Defense. The Commission on Public Safety and Defense was succeeded in 1919 by the Commission on Public Welfare, which received an appropriation of \$500,000 to carry on the work of reconstruction, Americanization, and collection of the records of the state's part in the World War. The session of 1919 also created a Bureau of Statistics and Information under the State Department of Internal Affairs, transferred the Bureau of Municipalities from the Department of

Labor and Industry to the Department of Internal Affairs, and created a Bureau of Rehabilitation under the Department of Labor and Industry. The year 1919 witnessed the adoption of two Federal amendments, Pennsylvania ratifying the prohibition amendment, as the forty-fifth state, on Feb. 25, and the woman suffrage amendment, as the seventh state, on June 24.

More recent governors were John K. Tener, Republican, 1911-5; Martin G. Brumbaugh, Republican, 1915-9; William C. Sproul, Republican, 1919-.

**War Period.**—Pennsylvania sent 297,891 men into the U.S. army, of whom 53,419 were regulars, 21,350 national guardsmen, and 223,122 drafted. There were 31,063 Pennsylvanians in the navy, 16,872 of whom enlisted in the naval reserve, 13,772 in the regular navy, and 419 in the national naval volunteers. The state was represented by 5,422 men in the marine corps, making a total of 334,376 men and women in the national armed forces. In addition it had 1,600 Y.M.C.A. workers, 147 Knights of Columbus secretaries, and 129 welfare workers under the Society of Friends. In the army Pennsylvania suffered 35,042 casualties, of which 7,898 were deaths. Financially, 559,936 Pennsylvanians subscribed \$315,834,950 to the First Liberty Loan; 881,207 subscribed \$549,963,700 to the Second Loan; 2,026,973 subscribed \$467,758,550 to the Third Loan; 2,349,252 subscribed \$812,217,400 to the Fourth Loan; and 1,289,764 subscribed \$564,173,200 to the Victory Loan, making a total of \$2,709,947,800 for the five loans, a per capita of \$32.92 as compared with the per capita throughout the United States of \$23.31. The war taxes of the state were: 1917, \$589,056,143.20; 1918, \$446,811,191. The American Red Cross in its two campaigns in Pennsylvania raised \$27,283,990.90 or 10% of the total for the whole country. The Red Cross membership in the state at the close of 1918 was 1,669,758 adults and 1,451,057 juniors, the latter being 86-12% of the school population. Pennsylvania gave approximately \$3,000,000 to the war welfare work of the Knights of Columbus. The two Y.M.C.A. drives in the state netted \$6,562,516.23.

More than 85,000 men and women were employed in the six Pennsylvania shipyards on the Delaware river in 1918. The Hog I. plant near Philadelphia built 110 cargo vessels of 7,500 dead-weight tons apiece and 12 transports of 8,000 tons. The Harriman yard at Bristol, of the Merchants' Shipbuilding Corp., built 32 cargo vessels of 9,000 tons apiece; William Cramp & Sons at Philadelphia built four tankers of 10,000 tons apiece and nine steel ships, all but one of which were of more than 9,000 tons. Likewise it launched 35 destroyers during the war period and 13 subsequently. The Chester yard of the Merchants' Shipbuilding Corp. built 28 cargo ships and tankers averaging 8,000 tons apiece and several small naval vessels. The Sun Shipbuilding Co. at Chester built 14 ships averaging 11,000 tons apiece and four cargo ships of 10,000 tons apiece. It also constructed nine mine-sweepers for the navy. The yard for wooden ships of the Traylor plant at Cornwells Heights built eight vessels of 3,500 tons each. The Federal Government spent \$46,396,266.80 in housing war workers in the state, \$2,321,000 being spent by the Emergency Fleet Corp. for shipbuilders, and \$23,375,266.80 by the U.S. Housing Commission.

The Remington Arms Co. at Eddystone manufactured 1,181,908 rifles up to two days before the Armistice, or 47% of the American rifles supplied to troops at home and abroad. The Baldwin Locomotive Works at Philadelphia and Eddystone contracted for 470 steam locomotives for the U.S. Railroad Administration and nearly 4,000 steam locomotives for the A.E.F. and the Allies. The Aluminum Co. of America, at Pittsburgh, manufactured 3,385,955 meat cans for mess kits, or two-fifths of the total made in America. The Edward G. Budd Co., Philadelphia, pressed and stamped 1,150,775 steel helmets, while a total of 2,767,237 helmets were painted and assembled in the Ford Motor Co. plant in Philadelphia. The entire cannon-forging output of the country during the war was 8,440 before Armistice Day, and Pennsylvania's contribution was 2,960, or almost two-fifths. One of the three American powderbag loading plants was located at Tullytown, Pa.; it employed 7,000 persons and had reached a capacity of 40,000 bags a day at the date of the Armistice. The Pittsburgh Plate Glass Co. at Pittsburgh had a total output of 81,845 optical lenses when the end of the war caused a general cancellation of contracts. (A. E. McK.)

**PENNSYLVANIA, UNIVERSITY OF** (see 21.114).—In 1910 the Henry Phipps Institute for the study, treatment and preven-

tion of tuberculosis was transferred to the university. In 1912 the college was divided into three separate departments—the college, the Towne scientific school, and the Wharton school of finance and commerce. In 1914 the school of education was established, with a four-year course leading to the degree of Bachelor of Science in Education; since then there has been held every spring at the university "Schoolmen's week," and teachers from all over the state assemble to take part in conferences and discussions. By a merger in 1916 the Medico-Chirurgical College of Philadelphia became an integral part of the university as its graduate school of medicine, and in 1918 another merger was effected with the Philadelphia Polyclinic and College for Graduates in Medicine. In 1917 a course in military science was established to qualify students for commissions as reserve officers. In 1920 the laboratory of hygiene and public health became the school of hygiene and public health.

During the decade 1910-20 there were many developments in the widening of the university's usefulness to the community through the establishment of extension schools. In 1920-1 the university had 964 officers of instruction, of whom 302 were in the college, and 213 in the department of medicine. The enrolment was 11,182 students including 2,652 women, of whom 753 were in the college (arts and science); 29 in biology; 780 in the college course for teachers; 1,281 in the summer school; 638 in the Towne scientific school; 2,277 in the Wharton school of finance and commerce; 1,439 in the evening school of accounts and finance; 996 in the extension schools; 760 in the school of education; 218 in the school of fine arts; 657 in the graduate school; 191 in the law school; 433 in the medical school; 101 in the graduate school of medicine; 735 in the school of dentistry; 30 in the school of veterinary medicine, and 6 in the school of hygiene and public health (duplications, 142).

Beginning with 1920 the tuition fees were raised from \$200 to \$250 in the college, the Towne school, the Wharton school, in education, law, dentistry, and hygiene; from \$200 to \$300 in medicine; and from \$100 to \$150 in veterinary medicine. In 1920-1 the income from tuition fees was \$1,425,000; the payment for "educational salaries" amounted to \$1,425,000, and for other salaries and wages \$678,000. In June 1920 the excess of the university's assets over its liabilities was \$26,000,000, and the donations for the year were \$278,000. The total value of real estate (including the university's buildings) was \$11,486,000; and libraries, museums, apparatus and furniture were valued at \$3,645,000. The university library, including numerous special collections, contained about 500,000 bound volumes and 50,000 pamphlets. A question of paramount importance concerning the future policy of the university was settled in 1921, when the trustees, in accordance with the overwhelming sentiment of the alumni, resolved that the university should continue as a private institution and not surrender its independence, as had been proposed, by becoming a state university with consequent supervision by the official representatives of the state Government.

In 1921 Gen. Leonard Wood (q.v.) was elected "head of the university" under such appropriate title as may be hereafter agreed upon." Later in the year Gen. Wood was appointed governor-general of the Philippines, and was granted a year's leave of absence before assuming his duties at the university. During the World War 9,204 students and alumni of the university saw service, of whom 7,411 were in the army, 856 in the navy, 827 in auxiliary service, and 110 in the armies of America's Allies. Of these 212 died for their country's cause. (E. F. S.)

**PENSION** (see 21.118).—The following summary shows the chief pension legislation in the United States during 1908-20. Legislation in Great Britain regarding pensions is described in the article following this: PENSIONS MINISTRY. An Act of March 4 1909 provided that under direction of the Commissioner of Pensions the expenses of last sickness and burial of deceased pensioners should be reimbursed. An Act of May 11 1912 granted \$30 per month to honourably discharged men who had served 60 days or more in military or naval service during the Mexican War. An Act of Feb. 19 1913 granted \$20 per month thereafter to survivors of Indian wars named in earlier Acts. An Act of March 3 1915 provided double pension in case of death of an officer or enlisted man of the navy or marine corps, or for disability of an enlisted man, resulting from an aviation accident. An Act of April 27 1916 granted a special pension of \$10 per month for life to persons whose names are entered on the "Army or Navy Medal of Honor Roll." An Act of Aug. 29 1916 granted double pension for disability or death of a student-flyer of the navy or marine corps due to an aviation accident. This Act also repealed Section 4716 of the Revised Statutes, which made disloyalty in the Civil War a bar to a pension. An Act of Sept. 8 1916

granted \$20 per month to the widow of a Civil War veteran who was his lawful wife during the period of his service, and the same rate to the widow of a veteran of the Civil War, Mexican War, and War of 1812, on reaching the age of 70 years. An Act of Oct. 6 1917 provided a payment of \$25 per month thereafter for widows of officers or enlisted men of army, navy, or marine corps, who served in the Civil War, in the Spanish-American War or in the Philippine insurrection; this Act was amended June 25 1918 making existing pension laws inapplicable to persons in active service on Oct. 6 1917, or entering it thereafter, except in so far as rights under any such law had theretofore accrued. An Act of July 16 1918 granted widows of officers or enlisted men, volunteers and regulars, who served 90 days or more in the Spanish-American War, Philippine insurrection, or Chinese Boxer rebellion, if without means of support other than daily labour and an actual net income not exceeding \$250 per year, \$12 per month and \$2 per month additional for each child under sixteen. In case of death or remarriage of the widow, the whole pension goes to any child or children under 16 years of age. An Act of Dec. 24 1919 provided that no one should draw both pension and compensation under war risk insurance (see below). The War Risk Insurance Act was made effective as of April 6 1917. An Act of May 1 1920 granted \$50 per month from that date to persons on the roll because of Mexican War or Civil War service; and \$72 to those so nearly blind or helpless as to require personal aid and attendance; also increasing rates of pension for certain permanent specific disabilities. This Act granted \$30 per month to widows of men who served in the War of 1812 or the Mexican War, also to widows, married prior to June 27 1905, of men who served in the Civil War and to certain remarried widows, with \$6 per month additional for each child under 16 years. In case of death or remarriage of widow, the whole pension goes to any child or children under 16 years. This Act also increased the pension to army nurses of the Civil War, and dependent parents of Civil War soldiers, to \$30 per month. An Act of June 5 1920 granted pensions ranging from \$12 to \$30 to soldiers and sailors who served 90 days or more in the Spanish-American War, Philippine insurrection, or China Relief Expedition, under certain conditions as to service, the rate depending upon degree of disability or age attained; this Act also increased rates of pension for certain permanent specific disabilities.

The following table, furnished by the Commissioner of Pensions, shows the number of pensioners on the roll at the close of the fiscal year, June 30 1921, together with disbursements of pensions for that year:—

	Soldiers	Widows, etc.	Total	Disbursements
Civil War	218,775	281,327	500,102	\$246,584,639.64
Spanish-American War	31,066	8,216	39,282	6,171,569.82
War of 1812	—	64	64	24,160.21
Mexican War	109	2,135	2,244	888,024.64
Indian Wars	3,784	2,569	6,353	1,565,862.41
Regular Establishment	13,832	4,081	17,913	3,456,191.45
World War	63	32	95	25,394.37
Total	267,629	298,424	566,053	\$258,715,842.54

By an Act of May 22 1920 provision was made for the retirement of Civil Service employees and for payment to them of certain annuities based on amount of salary, length of service and age or disability. The annuity fund is created in part by the deduction of 2½% from the salaries of employees. The minimum annuity is \$180 per year, the maximum \$720. This law is administered by the Commissioner of Pensions. On June 30 1921 there were 6,471 annuitants on the roll, to whom had been paid \$2,913,547.

**War Risk Insurance.**—Soon after the outbreak of the World War, at the request of the Secretary of the Treasury, there was created, Sept. 2 1914, a bureau of marine insurance, under the Treasury Department, for protecting American vessels and cargoes against loss or damage. After America entered the war further legislation, enacted June 12 1917, enlarged the scope of the marine bureau to make provision for insuring against loss of life or injury masters, officers, and crews of American vessels. Under date of Jan. 4 1919, seven weeks after the signing of the Armistice, right to application was withdrawn and no further insurance issued to seamen. From

June 12 1917 to June 30 1919, the end of a fiscal year, the number of policies issued was 6,150; net insurance written, \$322,429,408; net premiums received, \$842,348; losses paid, \$124,724.

By Act of Oct. 6 1917 further amendment made provision for granting allowances by the Government to the families and dependents of all enlisted men. To secure this allowance the enlisted man was required to make an allotment from his pay. Two classes of allotment were established, A, compulsory allotment to a wife, child, or divorced wife awarded alimony; B, voluntary allotment to parent, sister, brother, grandchild, or grandparent. To these allotments the Government added allowances, not exceeding \$50 per month, as follows. Under Class A, \$15 per month was deducted from the enlisted man's pay and addition made by the Government to bring the monthly payment up to \$30 for a wife; \$40 for a wife and one child; \$47.50 for a wife and two children; and \$5 for each additional child. Under Class B, the Government added monthly \$10 for one parent, \$20 for two parents, and \$5 for each dependent sister, brother, grandchild or grandparent. If a man, in addition to the compulsory allotment, desired an allowance under Class B, he was required to make an additional allotment of \$5 per month. In case of no compulsory allotment, the voluntary allotment under Class B was \$15. Class A, took precedence, and, if the entire Government allowance of \$50 was required for this, no payment was made under Class B. From Oct. 6 1917 to June 30 1920 requests for allotments and allowances numbered 1,666,607; during the same period 2,807,093 application blanks were returned without such requests. For the fiscal year ending June 30 1920 allotments paid beneficiaries amounted to \$20,748,709; Government allowances, \$32,819,027.

The Act of Oct. 6 1917 also provided compensation for death or disability of all persons in service, including women in the army and navy nursing corps, in line of duty. The recognized beneficiaries include a widow until remarriage, dependent widower, children under 18 years, and dependent mother or father. Death compensation allowed was as follows: widow, \$25 per month; widow and one child, \$35; widow and two children, \$42.50; widow and three children, \$47.50; widow and four children, \$52.50, with no further allowance for additional children. If the deceased were a woman, \$20 per month was granted for the first fatherless child, \$10 in addition for the second, \$10 in addition for the third, \$5 in addition for the fourth, and \$5 in addition for the fifth, with no further allowance for others. A mother or father was allowed \$20 per month, and, if both were dependent, \$15 each. The maximum death compensation was \$75 per month. Compensation for disability depended upon its seriousness and duration. For a man totally disabled it was as follows: unencumbered, \$30 per month; if he had a wife, \$45; if he had a wife and one child, \$55; \$10 additional each for a second and third child, with no further allowance; and \$10 additional for each dependent father or mother. At the close of the fiscal year, June 30 1920, compensation was being allowed on 42,045 death claims, and on 134,408 disability claims, the latter involving a monthly payment of \$5,036,103. In the case of disabled persons provision was also made that the Government furnish free medical service and supplies, including artificial limbs so far as "reasonably necessary."

A novel feature of the Act of Oct. 6 1917 was the provision for granting insurance at peace-time rates to any person, man or woman, in active military or naval service. Such insurance was wholly voluntary, and could be taken out, in multiples of \$500, for any amount from \$1,000 to \$10,000 inclusive, at a monthly premium rate varying from 63 cents per \$1,000 at the age of 15 to \$3.35 at the age of 65. All persons in service Dec. 14 1917 were given until April 12 1918 to apply for policies, and those entering later were given 120 days. Among the beneficiaries allowed were wife, husband, child, grandchild, sister, brother, stepbrother, stepsister, adopted brother or sister, parent, grandparent, and step-parent. A man's fiancée could not be named as beneficiary. This insurance was issued on the yearly renewal basis, to be continued as term insurance for five years after the proclamation of peace, when it would automatically expire. Privilege, however, was granted for converting this temporary insurance, in whole or in part, into one of the permanent forms of Government insurance, including ordinary life, 20-payment life, 30-payment life, 20-year endowment, 30-year endowment, and endowment maturing at the age of 62. Premiums on converted policies may be paid monthly, quarterly, semi-annually, or annually. In the case of monthly premiums, 31 days of grace are provided. If term insurance is allowed to lapse, reinstatement may be secured within 18 months after discharge from service or 12 months after lapse, but health of the applicant must be as good as it was at the time when the premium was first withheld. Never before was insurance on such a large scale undertaken. The cost of administration was assumed by the Government and not included in the computation of the premiums for term insurance. The hazards of war were ignored and peace-time terms offered, such as no commercial company could have undertaken. The inevitable loss to the Government was regarded as part of the cost of the war. All converted insurance was to be administered by the Government and not handled through commercial companies. At the time of the Armistice, Nov. 11 1918, there were on file 4,152,787 applications for insurance. Between Oct. 6 1917 and June 30 1920 there were filed 4,631,993 applications for term insurance, requesting a total insur-

ance of \$40,284,892,500, an average of about \$8,697. On the last-mentioned date there had been issued 4,610,185 certificates for term insurance. The amount involved exceeded that in all commercial life insurance companies and fraternal organizations of the United States combined. About 98% of the enlisted personnel had taken advantage of this unprecedented opportunity. Every effort was made to induce policy-holders to convert their war-risk insurance into some form of permanent Government insurance, but by far the greater number allowed their policies to lapse. In 1921 all the activities concerning the welfare of ex-service men were consolidated in the Veterans' Bureau.

**PENSIONS MINISTRY (Great Britain).—**Before the World War the Admiralty and the War Office were responsible in the United Kingdom for the award and payment of service and disability pensions. The commissioners of the Royal Hospital, Chelsea, acted for the War Office in respect of pensions to warrant officers, N.C.O.'s and men. Pensions to privates and N.C.O.'s were paid quarterly by the regimental paymaster, those to officers and warrant officers by the paymaster-general. In the financial year 1913-4 there were in round numbers 60,000 service and 25,000 disability pensions for the army (men), and for the navy 33,000 and 7,700 respectively. The total annual cost to the State was £3,695,000. In the subsequent changes the disability pensioners were transferred to the new organizations, the service pensions remaining unaffected.

The first war alteration was made in Sept. 1914. A Central Army Pension Issue Office was set up and weekly instead of quarterly payment of pensions was authorized. Next, by the War Pensions Act 1915, the local war pensions committees were set up, under a statutory central committee "for the purpose of administering supplementary assistance in case of hardship and providing for the after-care of disabled officers and men." These committees were appointed under schemes of local authorities, more than half the membership being nominated by these authorities. The Ministry of Pensions was subsequently set up by the Act of Dec. 1916. This transferred to a minister responsible to Parliament the powers and duties of the Admiralty, the War Office, and the Chelsea Commissioners "in respect of the administration and payment of pensions and grants to officers and men, to their widows, children and dependents and to persons in the nursing service of the Naval and Military forces," the administration of service pensions being left with the service departments. It was provided that the powers and duties of the statutory committee above referred to should be continued under the control of the minister, who should communicate through it with the local committee. This arrangement proved unworkable, and in 1917 a new War Pensions Act dissolved the statutory committee and transferred its powers to the minister. A pensions appeal tribunal was set up. In 1919 a further Act conferred a statutory title to pension, subject to the conditions of the royal warrant. Previously it had been, in theory, only an act of grace. Independent statutory appeal tribunals were also appointed.

In the Ministry of Health Act (1919) provision was made for the transfer by order in council of "all or any of the powers and duties of the Ministry of Pensions with respect to the health of disabled officers and men after they have left the service" to the Minister of Health, at a date "not earlier than one year or later than three years after the termination of the present war." A further addition to the series of the Pension Acts was made in 1920, when an Act was passed providing that after the termination of the present war fresh cases were not to be transferred to the Ministry of Pensions, but were to remain, as in pre-war days, under the care of the War Office and Admiralty respectively, to whom the Air Ministry must now be added. Finally under the War Pensions bill of 1921, it was proposed that the large proportion of temporary awards should be converted into permanent awards, a right of appeal being granted to the pensioner. The period was to be within four years of his discharge from the service or after the first award of a pension to him. The administrative functions of the local war pensions committees were also to be limited and the numbers of these bodies reduced.

*Award of Pensions.*—Pension finance, generously revised at the outbreak of the World War, was reorganized from time to time in

accordance with the changing type of recruits and the rise in the cost of living. The scales of 1917 and 1918 were again considered in 1919 by a select committee of the newly elected House of Commons, which settled the rates governing payments till 1923. The principle of payment is that of compensation for disablement attributable to or aggravated by war service. "Disablement" is assessed by purely medical opinion, in terms of a percentage reduction from the standard of a normal healthy man. The pension is on a flat rate graded from 20% to 100%; below 20% only a lump sum is awarded payable usually in weekly allowances. Pensions are in the first instance awarded temporarily—usually for 12 months—and remain temporary till the disability has reached its final and stationary condition, when they are made permanent. The patient is subject to periodical medical examination during this time, and at each "board" his disability is reassessed for the next period. In addition the principle was laid down in 1917 that no account was to be taken of the earnings of disabled men. The "alternative pension" was also provided whereby a man might obtain a pension (within certain limits) running up to his full pre-war earnings, which by the Warrant of 1919 were further loaded up by 60% on account of the increased cost of living. Widows, also, may choose alternative pensions (husband's earnings plus 60%), and this right has been exercised in a large number of cases. The new pension scales were not to be subject to revision before April 1923.

The following figures may be quoted from the Warrant of 1919:—

(1) Totally disabled (privates):

Man	40s.
(+ attendance allowance up to 20s. if helpless)	
Man and wife	50s.
Man, wife and one child	57s. 6d.
Man, wife and two children	63s. 6d.
For each additional child	6s.
(2) Widows:	
Childless	20s.
(+ 6s. 8d. if aged 40)	
With one child	36s. 8d.
With two children	44s. 2d.
For each additional child	6s.

Although the assessment of disablement is a purely medical matter, the question of entitlement (*i.e.* whether due to war service) is decided by medical and lay opinion combined. The claimant has an appeal against the assessment of a medical board to a medical appeal tribunal; he may similarly appeal against refusal of entitlement to one of eleven statutory pensions appeal tribunals set up under the 1919 Act. These are appointed by the Lord Chancellor and are independent of the Ministry of Pensions.

**Constitution.**—In 1918 the Ministry consisted of the following branches: (1) Finance (including pensions issue office); (2) awards (men); (3) awards (men's widows and dependents); (4) awards (officers and officers' widows and dependents, and medical treatment and training of officers); (5) local administration; (6) medical services; (7) vocational training; (8) artificial limbs; (9) surgical appliances; (10) chief inspector; (11) special grants committee. The only important change in these divisions has been in the case of vocational training, which in 1919 was transferred to the Ministry of Labour (save for convalescent centres associated with medical treatment).

In April 1919 a scheme of regional decentralization was begun, and during the following 12 months 11 regions were set up. Each is governed by a director, assisted by a commissioner of medical services, a regional administration officer, an awards officer, a finance officer, a registrar, and staff. These regional offices carry on (1) medical examination; (2) awards of pensions; (3) control of Ministry hospitals; (4) supervision of the local war pensions committees. The Ministry itself, whose staff had numbered at its inception in 1917 2,296, expanded with its work to 5,751 in its first year, and in 1921 had reached 26,000, which included 8,000 hospital staff. (Of the male staff at this date 94% were ex-service men.) The local war pensions committees then numbered 349, with nearly 1,000 sub-committees. They had 27,500 members and a paid staff of 6,200 in addition to many voluntary workers. Space precludes more than a mention of the special grants committee, the chief function of which is to make supplementary and special grants where need exists, under regulations approved by the Ministry of Pensions.

**Duties.**—The machinery was great, but the burden was gigantic. By 1917 (when the Ministry came into being) 262,000 pensions in all had been granted. The number was doubled in the following 12 months. The increase continued rapidly; at one time as many as 35,000 new awards were made in a week. The pressure was greatest in the first six months of 1919, when demobilization was at its height. It was estimated at the beginning of 1921 that the crest of the curve had been reached; cessation or reduction of temporary pensions had begun to balance new awards, and medical treatment to be commensurate with the demand.

The subjoined figures have been taken as exemplifying the business of State pensioning at its maximum. (The figures are approximate and are taken from the estimates for 1920-1.)

Cost of administration 1920-1, including medical services, and local war pensions committees	£5,000,000
--	------------

Cost of local war pensions committees (administration)	£1,150,000
Money disbursed through local war pensions committees 1920-1 (recoverable advances, treatment allowances, etc.)	£20,000,000
Estimated total cost of pensions including medical services and administration expenses	£123,000,000.

From these sums were treated or maintained, partially or wholly, both the World War and pre-war disability pensioners (the awards of these last by the Royal Warrant of 1917 had been levelled up to the corresponding war scale). The total number of awards had increased from 262,000 in 1917 to 1,849,000 at Dec. 31 1920, made up as follows:—

Disabled men	1,216,000
Widows	226,000
Dependents	384,000
Children	23,000

The pensions, temporary and permanent, actually in payment on Dec. 31 1920 were:—

Disabled men	1,180,000
Widows	169,000
Dependents	362,000
Children	16,900

In addition the following first awards of disability retired pay or pension had been made:—

Officers	56,487
Officers' widows	10,408
Officers' children	11,302
Officers' other dependents	7,077
Nurses	2,045
Nurses' dependents	22

In payment on Dec. 31 1920 (approx.):—

Officers	38,850
Officers' widows	9,700
Officers' children	9,100
Officers' other dependents	6,500
Nurses	1,458
Nurses' dependents	22

Including wives' allowances, and children's allowances the total number of beneficiaries was nearly 3,500,000.

Medical treatment was being carried on in 84 hospitals and convalescent centres and 150 clinics. The Ministry controlled 14,000 beds in its own institutions and 10,000 in civil institutions (*c.f.* the whole voluntary hospital system of the country, which has not more than 40-50,000 beds). There were under treatment at any given time 158,000 cases. The cost of this, including allowances to men under treatment, in excess of pension, amounted to £16,000,000 per annum. The doctors directly employed were 464, the hospital staff numbered 7,600; in addition, for assessment purposes, there were 450 medical boards, each of three members, examining over a considerable period from 21,000 to 25,000 men every week.

**Special Features.**—In addition to the mere mass of the task, many most baffling problems demanded solution. The Ministry, in addition to pensions work and medical treatment, had for example to undertake the supply and repair of artificial limbs and surgical appliances (a special division of the Ministry was organized to deal with this). There were in Dec. 1920 23,932 officers and men pensioned on account of amputations of the leg, and some 64,000 cases of wounds of the upper extremity involving amputation of arm or part of the hand. There were 8,000 cases of epilepsy, 114,000 cases of "heart disease" and 69,000 cases of nervous disease (under which are included both "shell shock" and "neurasthenia").

There was no medical staff in existence to cope with such numbers. In the case of the "nervous diseases" a special training school for psycho-therapy and other forms of treatment was established in London, where a four months' course was given. The problem of "heart disease" demanded specialist attention; a system of special cardiologists boards and clinics for examination and diagnosis was started in London, and extended throughout the country.

For the concurrent treatment and training of the broken men six large centres had been opened by Jan. 1921, and it was intended to open two more, giving accommodation in all to between 3,000 and 4,000. The effect of concurrent treatment and training upon the health and prospects of the patients were extremely beneficial. Difficulties were experienced in their absorption in industry, and efforts were made to overcome this by the institution of a national Roll of Honour by which firms pledged themselves to employ a certain proportion of disabled men, while special treatment for the permanently unfit was being considered. (W. E. EL.)

**PERCIN, ALEXANDRE** (1846— ), French general, was born at Nancy (Meurthe) on July 4 1846. He entered the Ecole Polytechnique on Nov. 1 1865, and two years later was appointed a sub-lieutenant of artillery. He was promoted lieutenant in 1869 and captain in 1870. He took part in the Franco-German

War and the commune fighting and was twice wounded—in Dec. 1870, at the battle of Patay, and again in April 1871 before Paris. He was made a major (*chef d'escadron*) in Jan. 1883, lieutenant-colonel in 1890, colonel in 1895, general of brigade in 1900, and general of division in 1903. In the period between 1900 and his retirement, Gen. Percin was a very active reformer and innovator in the tactics of the artillery arm. The typical field-artillery tactics of 1914, based on time shrapnel covered fire, and on the intimate liaison of infantry and artillery, were largely due to his work, and after his retirement he continued a very active student and critic of artillery operations. His marked personality, and his political opinions as a radical, however, made him many enemies. At the outbreak of the World War he was recalled to service, but only as commander of the Lille region, and he was involved in the controversies connected with the evacuation of Lille. Later he was employed for a short period as inspector-general of artillery units. In Jan. 1915 he was placed in the reserves. He was given the Grand Cross of the Legion of Honour in June 1917.

Amongst his more important works are *La Manœuvre de Lorraines*, *L'Artillerie aux Manœuvres de Picardie* (English translation, War Office, 1912) and a psychological study of battle under the title *Le Combat* (1914).

**PERCIVAL, JOHN** (1834–1918), English divine, was born in Westmorland Sept. 27 1834, the son of William Percival, of a yeoman family. He was educated at Appleby and Queen's College, Oxford, where he took his degree in 1858. In 1860 he was ordained, and went to Rugby as an assistant master. In 1863 he went to Clifton College as first headmaster, remaining there for 15 years. He was elected president of Trinity College, Oxford, in 1878, and while in this position took much interest in the foundation of Somerville College for women. In 1887 he became headmaster of Rugby, and in 1895 was appointed to the bishopric of Hereford. His broad churchmanship placed him in opposition to the dominant tendency in the Church of England, and he was also a strong and militant Liberal in politics, being an ardent advocate of the disestablishment of the Church in Wales. He died at Oxford Dec. 3 1918.

**PÉREZ GALDÓS, BENITO** (1843–1920), Spanish novelist (see 21.139), died Jan. 4 1920. The final series of his *Episodios Nacionales* contained *España sin rey* (1908); *España Trágica* (1909); *Amadeo I.* (1910); *La Primera República* and *De Cortago á Sagunto* (1911); and *Canovas* (1912). He also published various plays and novels, including *El Caballero encantado* (1909), and *Santa Juana de Castilla* (1918).

See L. Olmet and A. Carraffa, *Los Grandes Españoles*, vol. i., Galdos (1912).

**PERIODICALS:** see NEWSPAPERS.

**PERISCOPE.**—An optical instrument used in land warfare and in submarine navigation, enabling an observer to see in all directions while remaining under cover or submerged. Essentially it consists in an optical system of lenses and mirrors, or mirrors alone, the upper part of which projects from cover, or from the deck of a submarine, while the observer looks into the lower end, receiving an image of the surrounding country or sea by reflection down a tube.

The use of reflecting mirrors for the purpose of observing from cover is no novelty, and during the trench warfare of the Crimean War 1854–5 a device was patented which scarcely differs from the simple mirror periscope of the World War. From the beginning of the 20th century, however, the practical introduction of submarine navigation brought about the development of new elaborate periscopes of great length and provided with an optical system of lenses, which were built into the structure of the submarine. At the same time, on land, the new necessities imposed on field artillery by the growing use of covered positions led to the development of scissors-telescopes (see RANGEFINDERS) and panorama-telescopic sights (see SIGHTS), in which the optical system was arranged with the tube of the telescope vertical and the object-glass and eyepiece systems at right angles to the axis of the tube. And in the World War, while optical instruments of this kind were elaborated and

improved, the periscope as such came into use for the infantry garrisoning trenches. Manufactured in large quantities it soon became an essential part of infantry as well as of artillery and machine-gun equipment. In the present article, periscopes for land service and those forming part of the equipment of submarines will be described in turn.

(1) *Land-service Periscopes* vary much both in design and size, some being only a few inches long while others are as much as 80 ft. in length. The simplest form of periscope, and that most generally used by troops, consisted of a tube, rectangular in section, provided with two mirrors, the upper of which, inclined at an angle of  $45^\circ$  to the axis of the tube, reflected the image of the foreground vertically downwards to a second mirror, also inclined to the axis at  $45^\circ$  into which the observer looked. But in order to obtain an adequate field of view, the mirrors, and therefore the box, had to be made somewhat large, and in the close-quarters conditions of trench warfare even the few inches by which they projected over the parapet or other cover made them sufficiently obvious to draw fire. Less conspicuous periscopes were therefore designed, and these, in order to take in enough of the foreground, had to be provided with a magnifying as well as a reflecting system. In the British service half of the stereoscopic scissors-telescope used in range-finders was frequently employed as a periscope. Its lower end was fitted with a ball-and-socket joint to enable it to be laid in any direction, and beneath this is a screw which can be screwed by means of a small lever into a piece of wood embedded in the side of a trench.

In an ingenious periscope designed by Messrs. R. & J. Beck of London (fig. 1) the upper prism is supported above the telescopic system on a flat strip of metal which can be slid through side supports on the body of the periscope. When in use, the prism is supported some inches above the body and is the only part that can be seen by the enemy. If it is shot away, it can be replaced in a few seconds. When the periscope is not in use, the prism is lowered and protects the upper lens in the body.

Small German periscopes were usually 1 metre or  $\frac{3}{4}$  a metre in length and had two eyepieces giving magnifications 10 and 15 diameters. The optical system is shown in fig. 2. They could be either held in the hand or attached to a direction stand.

A neat rainguard made of sheet metal, to the same curve as the body of the periscope and almost 8 inches long, is attached to the upper prism box by two spring straps. When in use, it is held at right angles to the periscope above the upper window by a bayonet catch; when not in use, it is lowered and sprung round the body of the periscope just below the upper prism box.

Many periscopes of considerable length and special design have been used, to enable observations being made in comparative safety from behind large objects, e.g. houses, trees, etc., or from folds in the ground. Of these the most remarkable is the German *Giant Periscope*, two specimens of which exhibited in the collection of trophies in the Imperial War Museum, Crystal Palace, have excited considerable popular interest. This periscope is considerably larger than any others, and was designed for observing over obstacles of between 9 and 26 metres in height. It can be rapidly erected or taken down and transported on its carriage. It consists mainly of 3 parts, viz. a steel telescopic mast and upper and lower optical systems which are attached to it.

The telescopic mast is carried in trunnions on the carriage, and travels closed and in a horizontal position. Gears are provided for elevating, levelling, aligning the upper and lower optical systems, adjusting the inclination of the reflector and rotating the mast around a vertical axis so that observations may be made and azimuth angles taken in all directions. The

FIG. 1

FIG. 2

telescopic mast consists of 8 tubes. The lower one is attached to the carriage, and the upper one is pulled out as far as it will go and retained in position by catches before the mast is raised. The other six are connected to each other and to the lowest one by wire

are reflected by a mirror B down the centre of the conical casing which contains the upper optical system and is attached to the top of the mast. The two achromatic lenses, C and D, bring the rays to a focus on the plane surface of the large lens, E, forming an image there. Immediately above this plane surface and almost touching it is a system of wires which enables angular distances from the centre of the field to be read at the eyepiece below. The mirror can be elevated and depressed by means of a flexible shaft which passes up the centre of the mast and actuates gear attached to the mirror frame.

From the large lens, E, the rays pass through the open air for a considerable distance, depending upon how much the mast has been raised, to the lower optical system. Here they pass through the lenses and prism shown into one of the eyepieces, F. By moving the lens G up and down the image can be formed in the correct position for the eyepiece at all extensions of the mast.

There are three eyepieces which are mounted on a revolving sleeve in such a way that any one of them can be quickly brought into use, to give the magnification suitable to the height of the mast. (Low power from 3 to 8; medium from 5 to 14; high from 7 to 21.) Each eyepiece is provided with a dummy eyepiece which comes opposite to the eye which is not observing and permits of it being kept open. This lessens eyestrain. Coloured anti-glare glasses are provided.

(2) *Submarine Periscopes.*—When a submarine is completely submerged the occupants are not able to see through the water except under very exceptional conditions. In the Mediterranean on a sunny day it is possible to see for several yards through the water at about 25 ft. below the surface.

In the North Sea, and usually, it might be said that once the boat is submerged, direct observation through the water is impossible. In the very earliest submarines a cupola was built on the top of the hull, which was kept just above the surface when it was desired to take observations. To reduce resistance, these cupolas were made telescopic in the French submarines "Gymnote" and the "Gustave Zédé," but the arrangement proved unsatisfactory. An optical tube replaced this cupola in the "Gustave Zédé," and comprised a short tube (on top of the submarine) with a lens to close the top end, which was kept just above the surface when running submerged. Horizontal rays of light entering at the top were reflected by a prism down the tube and focussed on to a sheet of paper in front of the helmsman inside the submarine. This gave him a limited view of what lay directly ahead. The word "periscope" was first applied to this instrument.

The modern submarine periscope consists essentially of a long tube, the top of which is just above the water when diving, while the lower end passes through a stuffing box on the shell of the boat into the control-room. The top is closed by a pressure-tight window, inside of which is a prism which reflects the light rays vertically down the tube to a prism at the bottom end, where they are reflected in a horizontal direction and focussed in an eyepiece attached to the bottom of the tube. Thus the commander can see what is happening on the surface when navigating the submarine some 20 ft. or more below it.

The greater the depth of submergence the less the disturbance made by the submarine on the surface of the water, and the greater the immunity from gun-fire, ramming, etc.; also in a sea-way the deeper the submarine the more readily is it controlled. For these reasons the length of the periscope has steadily increased, and the dimensions of the upper end have as steadily decreased. Increased length necessitated an increase in the diameter of the main tube to limit the amplitude of the vibrations caused by being pushed through the water. A typical instrument in the British navy was 30 ft. long, with a 5.9 in. diameter main tube, and the top 3 ft. of the upper tube 2 in. diameter. For the German "U" boats Messrs. Zeiss made a periscope 7 metres long, main tube 150 mm. (5.9 in.), and about 2 ft. 6 in. of the top tube 30 mm. (1.2 in.) diameter.

The main tube must be accurately machined as it has to be readily trained in its stuffing-box as well as be water-tight in all positions, through a considerable range of vertical travel. The modern practice is to take rapid observations rather than to keep the periscope above the water all the time. To facilitate this mechanical lifting, gear is provided which is readily controlled, and can raise or lower the periscope at a speed approaching 25 ft. per minute.

The field of view is usually about 40° at a magnification of 1.5. It is therefore necessary to train the periscope round when taking observations on different bearings. This can be done in two ways, either by rotating the optical train inside the main tube, or, as is more usually the case, rotating the whole periscope. With the increase in weight and size the effort required has increased, and power training has sometimes been necessary. Where possible,

FIG. 3

cables and pulleys in such a way that when the cable which connects the two lowest tubes is wound in by means of a winch, each of the tubes except the fixed one will rise within the next one

FIG. 4

through the same distance. When erect, the mast is steadied by means of three guy ropes.

The details of the optical systems are as follows: The rays from a distant object after passing through a protecting window A (fig. 5)

FIG. 5

however, by refinements in workmanship, etc., efforts are made to keep the torque required so low as to be within the power of the operator. Usually a revolving scale round the edge of the field shows the direction of the view. If the whole instrument moves, the operator also moves round with it in the boat, and knows at once in which direction he is looking.

Owing to proximity to the magnetic compass the whole of the tube must be non-magnetic. High-strength bronze was used in the earlier practice in the British navy. A special nickelchrome steel was manufactured and machined by Messrs. Krupp for use for the outer tube of the German navy periscope used before the war, and a similar steel was developed and used in the British service, but it is costly and more difficult to machine to the required accuracy than is the case with bronze.

The use of aircraft for anti-submarine work led to the demand for a periscope which could be used for looking overhead. In the sky-searching periscope the upper prism can be rotated by mechanism inside the periscope, so that aerial observations can be readily made before the submarine "breaks surface."

To enable a distant ship or other object to be examined more closely it is possible in some periscopes to change the magnification from a normal power of 1.5 to a power of 6. This, and the sky searching previously mentioned, means increased internal gearing and a larger upper tube. As a rule every submarine has at least two periscopes, one unifocal with a small upper tube and the other bifocal and sky-searching with a larger upper tube.

Whilst in the British service sky searching up to right overhead was arranged for, German periscopes as a whole are limited to 20° above the horizontal. In each case 10° depression is allowed for to follow the roll of the submarine.

For special purposes other features are added, such as range-finding attachments, etc. A "night" periscope for use at dusk has been developed. It is much shorter than the typical instruments described, so that the maximum brightness of image is obtained.

The periscope when installed in the submarine is used for two purposes: (a) general observation for submerged navigation; (b) for correctly aligning the submarine when firing a torpedo at a target. In connexion with (a) the principal requirement is clearness of field. Continuous use of a periscope is very trying for the observer's eyes, and for use in bright weather light-filter screens are provided to reduce the glare. It has also been found that in foggy and misty weather suitable colour screens are of assistance. These screens are usually embodied in the eyepiece. For purposes of torpedo attack the periscope is used as a range-finder to determine the distance the target is away, and also in connexion with tables to determine the correct time to fire the torpedo, allowing for the speed of the enemy, course, etc. Officers of submarines have devised various mechanical devices to avoid calculations, and these have been added to the periscope. Although two periscopes are provided when attacking, one only would be shown for short periods to get check observation so as to prevent the wash of the upper tube revealing the proximity of the submarine.

**PERKIN, WILLIAM HENRY** (1860– ), English chemist, was born at Sudbury, England, in 1860, eldest son of Sir William Perkin, founder of the aniline dye industry. He received his general education at the City of London School, and his scientific education at the Royal College of Science, South Kensington, and at the universities of Würzburg and Munich. During 1883–6 he held the position of *Privatdozent* in the university of Munich. In 1887 he returned to England and became professor of chemistry at the Heriot-Watt College, Edinburgh. In 1892 he accepted the chair of organic chemistry at the Victoria University, Manchester, which he held until 1912. During this period his stimulating teaching and brilliant researches attracted students from all parts, and he formed at Manchester a school of organic chemistry famous throughout Europe. In 1912 he succeeded Prof. Wm. Odling as Waynflete professor of chemistry at Oxford. He soon made his influence felt there—new and more extensive laboratories were built, and for the first time in England a period of research became a necessary part of the academic course in chemistry for an honours degree. Prof. Perkin was president of the Chemical Society from 1913 to 1916. He was awarded the Longstaff medal of the Chemical Society in 1900, and the Davy medal of the Royal Society in 1904. The main results of his work are embodied in a very numerous and brilliant series of papers in the *Transactions* of the Chemical Society. The earlier papers deal chiefly with the properties and modes of synthesis of cloud chain hydrocarbons and their derivatives. This work led naturally to the synthesis of many terpenes and members of the camphor group; also to the investigation of various alkaloids and natural colouring matters. In addition to purely scientific work Prof. Perkin always kept in close touch

with chemical industry. His text-books on practical chemistry, inorganic and organic chemistry, written in conjunction with Prof. Kipping, are in general use.

**PERNERSTORFER, ENGELBERT** (1850–1918), Austrian politician, was born on April 27 1850 at Vienna, the son of a small master tailor. While still a lad at the *Gymnasium* he had to earn his living by giving lessons. At the *Schottengymnasium* he struck up a close friendship with Viktor Adler, and became interested in the Pan-German political movement. While still at the *Gymnasium* he gave courses of lectures at the Workmen's Education Union. At the university he came into contact with Schönerer, to whose intimate circle he belonged. He collaborated in the preparation of the so-called Linz programme of the Left National party, and for a quarter of a century, from 1881 onwards, he edited the periodical *Deutsche Worte*. He separated from Schönerer as the latter adopted an increasingly reactionary and anti-Semitic attitude. He was also the inspirer and one of the founders of the German School Union. In 1885 he was elected to the Austrian Parliament as independent candidate for the manufacturing centre of Wiener-Neustadt. From that time, with the exception of the electoral period 1897 to 1901, he sat in Parliament until his death, and from 1907 onwards was its vice-president. In 1907 he became president of the parliamentary Social Democratic party, which had in the meantime increased in number to 87 in consequence of the adoption of universal suffrage. He died, after a rather long illness, in Vienna on Jan. 7 1918.

**PERRY, JOHN** (1850–1920); British mathematician, was born in Ulster Feb. 14 1850 and educated at Queen's College, Belfast. Though he took a post as a schoolmaster in 1870, he also qualified as an electrical engineer and devoted much of his time to turning mathematics to practical account. He served for a time as assistant to Lord Kelvin. Later he was associated with Prof. Ayrton and together they were responsible for many inventions in electrical apparatus (see 3.76, 8.782 and 783, 9.236, etc.). In 1881 he became professor of engineering and mathematics at the City and Guilds of London Technical College and in 1896 professor of mathematics and mechanics at the Royal College of Science, retiring in 1914. He published many books on applied mathematics and did much to further scientific engineering, especially by his lectures to operatives and by such works as *The Steam Engine* (1874), *Spinning Tops* (1890), *The Calculus for Engineers* (1897), etc. During the World War he was an adviser on gyroscopic compasses. He died in London Aug. 4 1920.

**PERSHING, JOHN JOSEPH** (1860– ), American soldier, was born near Laclede, Mo., Sept. 13 1860. He studied at the Kirksville (Mo.) Normal School (B.A. 1880); graduated from the U.S. Military Academy in 1886; was commissioned second-lieutenant and immediately assigned to the 6th Cavalry in a campaign against the Apaches in Arizona. His conduct won the praise of General Nelson A. Miles, and in 1890, during an uprising of the Sioux, he was sent to Dakota, in charge of the Indian scouts. In 1891 he was appointed military instructor at the university of Nebraska, remaining there four years. He entered the law school and received the degree of LL.B. in 1893, having been made first-lieutenant the preceding year. In 1897 he was appointed instructor in tactics at the U.S. Military Academy, but on the outbreak of the Spanish-American War (1898) asked to be assigned to active duty. He served in Cuba through the Santiago campaign, was appointed chief of ordnance with the rank of major of volunteers, and in June 1899 assistant adjutant-general. He organized in Cuba the Bureau of Insular Affairs of which he was head for several months. In Nov. 1899 he was sent to the Philippines as adjutant-general of the Department of Mindanao, and in 1901 was honourably discharged from volunteer service. The same year he was made captain in the regular army and later conducted a campaign against the Moros, which he completed with success in 1903. The same year he returned to America and was appointed a member of the General Staff. In 1905 he went to Japan as military attaché to the American embassy, and during the Russo-Japanese War spent several months as military observer with the Japanese army in Manchuria. As a reward for his success in the Philippines President

Roosevelt in 1906 finally secured his promotion from captain to brigadier-general, passing him over 862 senior officers. Soon after he returned to the Philippines as commander of the Department of Mindanao and governor of the Moro Province. Here again he was engaged in quelling the insubordinate Moros until his decisive victory at Bagsag June 12 1913. He was then placed in command of the 8th Brigade at San Francisco. While he was temporarily absent in 1915 on duty at the Mexican border his wife and three young daughters lost their lives in a disastrous fire, but his son was rescued. In March 1916 he was put in command of the punitive expedition into Mexico against Francisco Villa, and the same year was made major-general. After the death of Maj.-Gen. Funston in 1917 he succeeded him as commander of all the American troops on the Mexican border. This position he held until America's entrance into the World War, and was then chosen to command the A.E.F. in Europe. With his staff he reached England June 9 1917, and four days later landed in France to prepare for the coming of the American troops. In Oct. 1917 he was made general, U.S.A. In some quarters it was felt that as the American detachments arrived they should be hastily trained and then distributed among the Allied forces already in the field, but from the start General Pershing insisted upon the integrity of the American army, though willing in cases of emergency to place detached American units in the different Allied armies. He was convinced that the presence of an independent American army would be a serious blow to German *moral*. In Dec. 1917 he forbade American soldiers the use of alcoholic drinks, excepting light wines and beer, allowing these only in deference to French customs. As Commander-in-Chief of the A.E.F. he planned the American attack at the Marne salient in 1918, as well as American operations at St. Mihiel and in the Meuse-Argonne. His management of the A.E.F. is clearly described in his succinct *Final Report* (less than 100 pages), issued by the Government Printing Office, Washington, Dec. 1919. His nomination by President Wilson to the permanent rank of general was confirmed unanimously by the U.S. Senate Sept. 1 1919, a grade held previously by only four Americans—Washington, Grant, Sherman, and Sheridan. In 1921 he was appointed Chief-of-Staff. By King George V. he was given the decoration of G.C.B.

**PERSIA** (see 21.187).—The autumn of 1909 was a turning point in Persian history. The despotic Shah had abdicated, thus ending the bad old order. Great Britain and Russia were sympathetic to Persia, the latter Power not only appointing a minister with liberal ideas, but withdrawing her troops gradually from Kazvin and Tabriz. In other words the field was clear and Persia had every chance of setting her house in order. The new Assembly met in Nov., when Siphahdar read a speech from the throne, full of good intentions. Nor did his Cabinet fail at the first difficult task. When the question of disbanding the *mujahidin* or "warriors of the Holy War" arose, these soldiers of fortune, for the most part, assumed a menacing attitude and threatened to mutiny unless their exorbitant demands for pay were granted, but the matter was finally settled without bloodshed. Far more dangerous was the discord that raged among the Nationalists, who again broke up into two parties, the "Revolutionaries" (now mis-named "Democrats") being bitterly hostile to the Moderates. Unfortunately the former party, by its activity, its violence, and its secret organization, gained the ascendancy. Nor were the leaders any better, Sardar-i-Assad, the Bakhtiari chief, intriguing with the "Revolutionaries" against Siphahdar. The raising of a joint loan of £500,000 from the two Powers, mainly to provide the pay due to the police and soldiers, encountered stormy opposition in the Assembly and was not carried through. The "Revolutionaries" forced their way into the Cabinet, with the result that no progress of any kind was made.

Siphahdar ultimately resigned and a "Democrat" Cabinet was formed under the influence of Sardar-i-Assad, whose nominee for the premiership was a Kajar prince, Mustaufi el Mamalik. It was hoped that office would sober the "Democrats," but little sense of responsibility was shown, together with an intense craving for the sweets of office. Generally speaking the Majlis made

Cabinet rule impossible. It was broken up into several parties swayed by passion, intrigue or greed for money, and would lightly pass votes of censure whenever an incident which appeared to be unfavourable to Persia was reported, without giving the minister concerned the chance of explaining matters. Moreover, the hostility of the Majlis and of the Cabinet towards Russia was exasperating to the northern Power.

*Chronic Disorder.*—In the autumn of 1909 M. Passek, Russian consul-general, was attacked by tribesmen, when travelling to Shiraz with an escort of Cossacks. A few months later, the British consul was attacked near Abadeh and two Indian sowars of his escort were killed. The authority of the governor-general of Fars was threatened by the Kashgais. In the N., adherents of the ex-Shah drove the governor from Ardebil, and Russia was suspected of being implicated in this plot—probably with justice. Elsewhere in northern Persia there was little disorder compared with the unsatisfactory state of affairs in Fars, which gravely threatened British commerce and other interests. So much was this the case that Great Britain began to consider the situation as one that might demand British intervention, and, in the autumn, the Persian Government was notified that, failing the restoration of order within three months, Persian levies under British officers would be raised to guard the trade routes.

In the autumn of 1910, Nasir el Mulk was elected regent in the place of the deceased 'Azud el Mulk, and reached Teheran at a critical time. Mustaufi had been obliged to resign; Siphahdar again formed a Cabinet and Sardar-i-Assad had left for Europe. The new Cabinet was settling down, when the ex-Shah, who had passed across Russia with munitions labeled "Mineral Waters," suddenly landed near Asterabad. At first, there was a panic at Teheran. Siphahdar, whose loyalty to the constitution was suspect, was induced to resign, his place being taken by the Bakhtiari chief Samsam es Sultaneh. The ex-Shah marched on Teheran while Salar el Dauleh simultaneously advanced on the capital from Kermanshah. The Russians undoubtedly favoured the ex-Shah, but his troops were defeated, as was the horde of tribesmen under Salar. Finally the ex-Shah retired to Russia, mainly because Great Britain declined to consider the question of his return to the throne.

*American Financial Mission, 1911.*—The financial troubles of Persia were mainly due to the all-pervading corruption and irresponsibility of the governing class. It is to the credit of the "Democrats" that an effort was made to deal with the situation by engaging the services of Mr. Morgan Shuster, an American, as financial adviser. Upon examining the situation, Mr. Shuster realized that, without extraordinary powers, he could do little. He therefore demanded the powers of a dictator, which were granted him by the "Democrats," with whose views he found himself in sympathy. Russia regarded his actions with hostility. He was advised by the regent to reorganize everything else before interfering with the comparatively model organization of the customs under his Belgian officials. Instead of following this sound advice, he began work with the customs, exciting deep animosities. Indeed, in many ways, he ignored the realities of the situation. To take an important instance, Shuster wished to organize a Treasury gendarmie and offered the task to Maj. C. B. Stokes of the Indian army, whose appointment as military *attaché* was expiring. Stokes was a Russophobe, owing to his strong pro-Persian proclivities, and Russia firmly objected to an appointment which would give him control over men stationed in every part of Persia. The matter caused much stir and was finally settled by Maj. Stokes being ordered to leave Persia and return to India. This was a rebuff to Shuster, but worse was to follow. The Russian Government was determined to oust him, but took action on a weak case. The Treasury gendarmes seized the principal property of Shu'a es Sultaneh, the young Shah's uncle, who had taken part in the ex-Shah's attempt. Actually he was a Turkish subject. However, the Russian consul-general, under the flimsy pretext that Shu'a owed money to the Russian Bank, sent some Russian Cossacks, who ordered the Treasury gendarmes to retire under threat of opening fire on them. A guard of Persian Cossacks was subsequently posted by orders of the Russian consul-general. On the following day Shuster dispatched a much stronger body of Treasury gendarmes who ejected the Persian Cossacks. Russia regarded this foolish act as a challenge and presented an ultimatum demanding an apology for the insult offered to her consul-general. When this had been accepted, she demanded the dismissal of Shuster. The Majlis at first refused with cries of "Death or Independence," while at Tabriz and Resht attacks were made on the Russians, who dealt sternly with the incidents, hanging the leading ecclesiastic and other notables at Tabriz. Russian troops supported

the ultimatum by marching on Teheran, and the Persians, recovering from their fond illusions, submitted. The failure of Shuster was disappointing. His selection was, perhaps, unfortunate, but, in any case, Russia would hardly have permitted him to succeed.

*Bombardment of the Meshed Shrine, March 1912.*—There were few acts more discreditably to Russia or more harmful to her true interests than the bombardment of the shrine of the Iman Riza, the chief centre of pilgrimage in Persia. The Russian consul-general at Meshed, who was determined to play a hostile rôle in Persia, had taken advantage of local disturbances to bring in a large Russian force under a major-general. There was no need for this, and the population, cowed by its arrival, was peaceful. This state of affairs, however, was not allowed to continue, as it meant no honours and no loot for the Russians. A notorious *agent provocateur* was sent to the shrine, where he soon collected large crowds to listen to his incendiary speeches. This was all that was necessary and the shrine was bombarded by the Russians, nominally to expel the agitators. Actually they were taken away by night in a wagon under a Russian escort. Many innocent men and women were killed and wounded; the sacred tomb-chamber in which lie the remains of Persia's saint, close to those of Harun al Rashid, was repeatedly struck by the shell-fire; and the treasury, which contained the rich gifts of countless pilgrims, was removed, but was afterwards restored, although by no means intact. The outrage excited intense feeling in Persia and, to a lesser degree, throughout the Moslem world. It demonstrated beyond all doubt the sinister policy of Russia, and was the chief cause of the hatred with which the northern Power was regarded. In England the bombardment passed almost unnoticed, as it occurred simultaneously with the disaster to the "Titanic," which entirely absorbed public attention.

*Persia in 1913.*—The year before the outbreak of the World War found Persia in a miserable plight. Russia was constantly strengthening her hold on the N. by seizing on, or creating, pretexts for further intervention. Great Britain was bound by the Anglo-Russian Agreement to coöperate with the northern Power, but did her best to help Persia to maintain her independence, a task which native incapacity, intrigue and corruption rendered very difficult. In her sphere of influence in the S. she supported the organization and development of the Swedish gendarmerie by advances of money and by other means, and tried to secure capable governors for Fars and Kerman. The position in Fars, the storm-centre of southern Persia, remained thoroughly unsatisfactory. The Kashgai tribe, the most powerful in southern Persia, defied the governor-general and raided in Fars as did the Boir Ahmadis; the Khamsheh Arabs raided the caravan routes in the Kerman province; and other tribes raided in the Fars, Yazd or Kerman provinces from time to time. It was generally realized that the evil was beyond the powers of the Persian Government to cure, but in pursuance of the British determination to avoid any increase of commitments—a decision that was eminently sound—action in the form of unsatisfactory palliatives was alone taken. Throughout this period, no Persian Cabinet would assume office without applying for a considerable advance of money from the two Powers. Money was given, the question of repayment was arranged, and there were practically no results. Much of the money was embezzled and the balance was spent to small advantage. The case of Capt. Eckford, who was killed by a raiding party of Boir Ahmadi tribesmen between Shiraz and Dasht-i-Arjan, is typical. The governor-general of Fars, Mukhbir es Sultaneh, who played a sinister rôle in the World War, took advantage of the incident to press for large sums of money, with which he proposed to raise a force of over 1,000 men, and expressed his confidence that he would be able to punish the Boir Ahmadis and other evil-doers without difficulty. The Swedish gendarmerie was already being organized in the province, but had the fatal defect from the point of view of a Persian governor-general that the money for their pay did not pass through his hands. At Teheran the Treasury was empty. A Cabinet bent on reform was being constituted with a programme which entailed a loan of about £5,500,000. Meanwhile, in order to support the governor-general of Fars in his unsuccessful attempts to restore order and punish the Boir Ahmadis, the British legation advanced a sum of £15,000 for three months and, later on, £100,000 for twelve and a half months. In Feb. 1913, the two Powers advanced Persia £400,000. The negotiations for a larger loan were connected with that of railway concessions of which some account is given below.

*Salar ed Dauleh.*—Among the many difficulties of the Persian Government, that of Salar ed Dauleh was particularly irritating.

That troublesome prince had rebelled against his brother Mahommed 'Ali Shah, had been defeated and had been kept under honourable arrest. When Mahommed 'Ali Shah made a bid to regain the throne in 1911, Salar had, as mentioned above, organized a movement from the S.W. and proclaimed himself Shah but, again, had been decisively beaten. In 1912, the irrepressible prince reappeared on the scene and, after occupying Kurdistan, threatened Hamadan. Farman Farma, appointed governor-general of Kurdistan, held Kermanshah against him, inflicting a repulse which drove Salar to take to flight. He then proceeded to lead the life of a brigand chief, fomenting local troubles and blackmailing any wealthy landowner or merchant who was unfortunate enough to fall into his hands. After the formation of the Cabinet of 'Ala es Sultaneh in 1913, it was decided to make terms with the prince who, mainly through Russian support, was nominated governor of Gilan. The regent realized the danger of appointing this "stormy petrel" to a post where he controlled the main route between Russia and the capital, and refused to sanction the appointment. The Russian Government, for a while, declined to permit it to be cancelled, but finally at the repeated request of the British, induced Salar to accept a pension and leave Persia. During the same period there was considerable anxiety as to the movements of the ex-Shah who, it was feared, was intending to make another bid for the throne, but the enquiries made by the British Government tended to show that there was no real cause for anxiety on the subject.

*The Swedish Gendarmerie.*—The general condition of Persia is one of chronic anarchy which is more intense the nearer any particular locality may be to the powerful raiding tribes. This anarchy the Persian Government is impotent to stop until there is a radical change of character and a movement towards virility and honesty in the governing class. A study of the Blue Books from one point of view is a summary of outrages and of ineffectual measures taken for their punishment, the British minister making the best of an almost hopeless situation and staving off a total collapse by a hand-to-mouth policy of doles, warnings and good advice. In view of the fact that Russia had organized a Persian Cossack brigade in the N., it would have been only befitting that Great Britain should organize a force for the restoration of order in the S., but so afraid of increased commitments was the British Foreign Office that it agreed to the Persian Government engaging Swedish officers for the formation of a gendarmerie and, in the summer of 1911, a mission composed of 20 officers reached Persia under Col. Hjalmarson. The Swedes had no knowledge of the country, the Moslem people, the language or oriental intrigue. The Russians eyed their mission unfavourably and would have rejoiced at its failure. They considered that, if successful, the gendarmerie would certainly become a dangerous rival to the Cossack brigade, which was only nominally controlled by the Persian Government and was actually under the orders of the Russian Legation. The Persian Cabinet, although anxious for the success of the gendarmerie, was generally apathetic and also irregular in making payments. The British legation, on the contrary, helped and supported the new force in every way, realizing that unless it succeeded in its very difficult task of restoring order, Persia might well break up into a number of robber-infested provinces. The Swedish officers who were drawn from the regular army, worked hard to train their men. At first, they enlisted the riff-raff of Teheran but gradually recruited a better class of men. Their ignorance of how to deal with Moslems led them to make many mistakes, but this was after all only natural. Generally speaking, they made good progress at the capital and in its neighbourhood.

The British legation, which was watching the dwindling of trade in Fars and the increasing lack of law and order, constantly urged the necessity for sending a force of gendarmes to that province and, in Feb. 1913, the first detachment left for Shiraz. Col. Hjalmarson's scheme for Persia was to place 1,500 men as road guards in Fars supported by a mobile column of 1,800 men. A contingent at Isfahan would form a link with headquarters at Teheran. He also intended to organize stations for the Qum-Sultanabad, for the Hamadan-Kermanshah, and the Saman-Damghan routes. These schemes would require about 8,000 men and would bring up the number of instructors to twenty-eight. The cost would have been about £400,000 for the first year and, later on, considerably more. The problem of Fars was very difficult, owing both to the power and disposition of the Kashgais, Boir Ahmadis and other tribesmen, and the rugged nature of the terrain. The Swedes made an unfortunate start at Bushire where they enlisted 168 men locally, many of them noted bad characters. These men, owing to two of their number being stripped naked and flogged, all resigned. Probably it was fortunate that they did so, for had they escorted a caravan of arms and ammunition to Shiraz, as was the original intention, it is hardly likely that it would have reached its destination with its contents intact. The gendarmerie marched into Fars and on the way made a successful attack on some Arab robbers, recovering a certain amount of looted property. Owing to the men belonging to N. Persia it was found impossible to take over the route near the coast, as the heat overpowered them, but they occupied it as far as Kazerun. At first the newcomers were not attacked, although the petty chiefs, who lived by blackmailing caravans, realized that if they remained their profits would cease. They were however afraid to move and the gendarmerie gradually established themselves and engaged a num-

ber of tribesmen as levies. In the vicinity of Shiraz, a detachment was taken out to attack the Kasghais before it was sufficiently trained, with the result that the men behaved badly and allowed themselves to be disarmed. However, they had constructed posts along the route and these they held at the outbreak of war.

*The Bakhtiari Domination.*—The chief role in the Persian revolution had been played by the Bakhtiari tribe which, entirely owing to the influence of Sirdar-i-Assad, had marched on Teheran and secured the abdication of Mahommed 'Ali Shah. During the years that followed, not only had they held the chief posts but their tribesmen had been the mainstay of the constitution. Whenever an expedition had been sent out, they drew money, arms and ammunition, most of which ultimately reached the Bakhtiari country. Sirdar-i-Assad had undoubtedly cherished the ambition of founding a new dynasty, but while events were favouring his designs, he became blind. However, his tribe continued to dominate Teheran and assumed a provocative attitude towards the gendarmerie. The Swedish officers took prompt action, surrounded the Bakhtiari quarter with machine-guns and artillery, and put an end to an intolerable state of affairs from which Europeans as well as Persians had suffered. The chiefs, perforce, agreed to dismiss the greater part of their contingents and felt the humiliation so keenly that they never again attempted to dominate the capital.

*German Activity before the World War.*—For some 20 years before the war, Germany had made strenuous efforts to increase her influence and interests in Persia. Perhaps the most definite success gained at the capital was the opening of a college staffed by German professors, to which the Persian Government was induced to contribute a handsome annual grant.

But to realize the persistence with which her policy was conducted, attention must be turned to the Persian Gulf. Before 1896 Germany had no representative or trade in that torrid region but, in that year, the campaign opened by the firm of Wonnekhaus establishing itself at Lingeh where it began dealing in mother-of-pearl; and, in 1897, a German vice-consulate was founded at Bushire. Three years later Germany made great efforts to purchase a site for the terminus of the Bagdad railway at Kuwait, but the astute Sheikh Mubarak had previously concluded a secret treaty with Great Britain by the terms of which, in return for protection, he agreed not to sell or lease any of his territory without the consent of that Power. Germany did not accept this rebuff as final and induced Turkey, members of Mubarak's family, and the Wahabis to take a hand in the game, but all direct attacks were foiled by British sea-power. A more successful plan was to induce the Turks to establish posts in Khor 'Abdalla, an inlet running from behind Biubiyan Is. to within 30 m. of Basra. The fact that the creek was situated in Mubarak's territory mattered nothing, and these posts were occupied until the outbreak of the World War. Five years after its foundation at Lingeh, the firm of Wonnekhaus, supported by German subsidies, opened its headquarters on the Bahrain Is. with branches at Basra and Bandar 'Abbas. The reason for the change of headquarters was soon evident as the islands are situated among the pearl banks, of which Germany attempted to gain control through a lease derived from the Sultan, whose claims in the Persian Gulf were shadowy. The little island of Halul, which is situated in the centre of the banks, was particularly aimed at, but Great Britain intervened and spoiled the new scheme. Germany was indefatigable in her efforts. Foiled entirely as regards the pearl fisheries, she attempted to control the working of the red oxide deposits of Abu Musa. The Sheikh of Sharjah, a Trucial chief, bound by treaty with Great Britain not to enter in an agreement with any other Power, had granted a concession for working these deposits to three Arabs, two of whom lived at Lingeh, while the third partner was his own subject. Wonnekhaus acquired the concession which the Sheikh promptly cancelled, sending a large body of his subjects to expel the concessionaires. This action raised a storm in the German press, but the case was too weak to be supported and merely a formal protest was made. The last attempt to be recorded was to secure a large piece of land along the river bank at Mohammereh, with the object of creating a German settlement, quays, etc., but again British vigilance was too strong. Much credit is due to Sir Percy Cox, the British Resident, for foiling every German attempt. In spite of these failures, in 1906 the Hamburg-America Co. started a service to the Persian Gulf. The first steamer created a sensation, lavish hospitality being dispensed to all comers, who also welcomed the novelty of a band. Trade was small at first and native passengers were not encouraged, but shipments of railway material helped matters and ultimately a flourishing trade was established. Great Britain, at the actual outbreak of war, was engaged in negotiations with Germany and Turkey. So far as the former Power was concerned, but for the war she would have secured a strong position at Basra, the destined terminus of the Bagdad railway. The suzerainty of Turkey over Kuwait was also acknowledged. In other words British predominance in the Persian Gulf would have been weakened. So far as this important problem was concerned, the results of the war have been beneficial.

*Persia at the Outbreak of the World War.*—The regent left Persia for more than a year in 1912, merely returning to arrange the coronation of the young Shah. This took place with due pomp

and circumstance in July 1914 and, as Nasir el Mulk left Persia again after the ceremony, the young monarch had hardly taken up his duties when the war broke out. His Majesty summoned the Majlis and duly proclaimed the strict neutrality of Persia. The position was, however, very difficult. The grantees were, in many cases, only anxious to receive money from one or more sides; the masses hated the Russians and disliked and mistrusted the British for being friends of their enemies. There was sympathy in some quarters for the Turks and "let the Christians devour one another" was frequently heard. But the outstanding feature was the powerlessness of Persia. Her military forces included the Cossack brigade 8,000 strong, the Swedish gendarmerie 7,000 strong, and the useless Persian troops under Persian officers.

At first sight it would seem unlikely that remote Persia should become a war theatre, but actually this was bound to be the case, unless she could defend her neutrality. A reference to the map will show that Azerbaijan, the N.W. province of Persia, marches with Turkey on the W. and with Russia to the N. Furthermore an advance by either belligerent through Persian territory would enable that Power to outflank the other and operate in open country, whereas a direct attack could only be made across the very high range which runs from the shores of the Black Sea to Mount Ararat. This strategical fact had been realized by Russia and Turkey before the outbreak of the World War, and both Powers, taking advantage of the impotence of Persia, had established themselves in Persian territory in the vicinity of Lake Urmia, the Turks holding the chief passes on the Perso-Turkish frontier which was only finally delimited just before war began.

*Russo-Turkish Operations in Azerbaijan.*—At the outbreak of hostilities the Russians, in this section of the war theatre, assumed the offensive and drove the Turks back on Van. However, the Kurds on both sides of the frontier rallied to the Turks and, finding Tabriz undefended, entered it in Jan. 1915. They then moved northwards along the road to Julfa, only to be repulsed by a Russian detachment which subsequently reoccupied Tabriz. At Urmia the Kurds, driving in front of them the Christian tribesmen of Targavar, assaulted the town, hoping to massacre its Christian inhabitants. But, aided by a small Russian detachment and the tribesmen of Targavar, the townspeople drove off the enemy. The Russians, in view of the Turkish invasion of the Kars province, were obliged to draw in their outlying detachments, and this was followed by the exodus of 10,000 Christians.

In the spring of 1915, after the crushing defeat of the Turks at Sarikamish, the Russians reoccupied Urmia and advanced to Van. They were joined by the Assyrian Christians of Kurdistan, who, when left alone to bear the brunt, actually migrated with their families and flocks to the neighbourhood of Urmia whence they raided their enemies the Kurds and generally did good service to the Russians, until the disintegration of the Russian army.

*Operations in S.W. Persia.*—Before war was declared by Turkey, the Government of India took the wise precaution of despatching a brigade of Indian troops to the Bahrain Islands. At the outbreak of hostilities, this force pushed up the Shatt al 'Arab to protect the important refineries of the Anglo-Persian Oil Co. on the island of Abadan. This brigade was rapidly increased to a division which, after defeating the Turks at Sahil, a few miles above the oil refineries, occupied Basra on Nov. 23. The occupation of Basra effectually protected the oil refineries, but these works in their turn depended on the oil-fields at Maidan-i-Naftun and the vulnerable pipe-line which was laid through Ahwaz and was 150 m. in length. The neighbouring tribesmen, partly through propaganda and partly through fanaticism, had breached and fired the pipe-line in several places. The Bakhtiari tribe, with which the British had maintained friendly relations for many years and which owned the ground on which the oil-wells were being worked, was generally hostile, the arrangement sometimes being that the fathers professed pro-British sympathies while the sons were fighting for the enemy. To protect the pipe-line, a brigade was despatched to Ahwaz, where it was faced by a considerable number of Turks supported by thousands of tribesmen. A reconnaissance in force found the enemy much stronger than was expected and was obliged to retreat with heavy losses, but

the enemy showed no inclination to attack the main body of the British who, for some time, maintained a defensive attitude. In the spring, Maj.-Gen. Sir G. Gorringe was ordered to attack the Turks with the 12th division. The enemy retreated and Gorringe, after dealing with the hostile Beni Tauf, drove them back on Amara, which had meanwhile been captured by Maj.-Gen. Sir Charles Townshend. As a result of these operations, Persian soil was cleared of the enemy, the local tribes made their submission, the pipe-line was repaired, and the valuable oil again flowed along it.

**German Activity in Persia.**—It is interesting to study the policy of Germany in the Middle East after the outbreak of the World War. Its object was to embarrass Russia and, still more, Great Britain, by forcing Persia and Afghanistan into the war on their side, and by creating disturbances on the frontiers of India and inside India. The scheme was sound, for, if Persia alone had declared for the Central Powers, the claim that Islam was on their side might have brought in Afghanistan. As it was, with comparatively small forces and at a relatively small cost, Germany certainly drew forces to Persia, which would otherwise have been available for other fronts. Had it been possible to march a Turkish brigade across Persia to Afghanistan, the Amir would probably have been obliged to join in an invasion of India or would have been killed. India at that time was weakly held, while the "Emden" had cut her sea communications. In the many arguments shown for and against the advance on Bagdad, this important question is apt to be neglected.

The plan of operations in Persia was two-fold. Agents well-furnished with arms and money were sent to enlist levies and to march across central and southern Persia, murdering British and Russian officials, and plundering and driving out the small English colonies. These groups were to form supports to missions destined for Afghanistan and Baluchistan. These latter bore letters on vellum written to the address of the Amir of Afghanistan and the ruling princes of India, and signed by the German Foreign Secretary. They also had various German decorations for distribution. They carried on a propaganda which was anti-Christian, giving out that the Kaiser and his people had become converts to Islam and that the former was now known as *Hajji Wilhelm*. The most successful German agent and the earliest in the field was Wassmuss, who before the war was consul at Bushire. He succeeded in organizing a strong anti-British confederacy in Tangistan, Dashti and Dashtistan, although there was also a pro-British party in these districts. The attacks on Bushire forced the British to increase the small number of troops that normally sufficed to guard the important wireless installation and the cable. Its defence suffered from the fact that the cable station was at Reshire, six m. distant, while the residency and other houses occupied by the British covered a large area outside the town. The Tangistanis made several daring raids, in one of which two British officers were killed. The strongly anti-British attitude of the Persian Government, which made no effort to protect the British colony, resulted in the temporary occupation of Bushire by the British, a step that afforded German propaganda a real chance that was fully exploited. Generally speaking, the activity of Wassmuss detained troops at Bushire, which were sorely needed elsewhere. In Fars, too, Wassmuss was equally successful. He found Mukhbir es Sultaneh, the governor-general, strongly pro-German owing to his education at Berlin. He also found the Swedish officers of the gendarmerie equally friendly and, through their instrumentality, he won over that force to his side. As a result, in the autumn, the British vice-consul was murdered and, shortly afterwards, the consul and the entire colony were arrested and taken to the coast, the men being held prisoners by the Tangistanis, while the women were sent to Bushire. Qawam el Mulk, chief of the Khamsch Arabs, who was acting governor-general, was driven out and retired to Lingeh, thus leaving the German consul supreme in Fars.

The main route by which German parties entered Persia from Bagdad was through Kermanshah and Hamadan. In April 1915, the Turks advanced on Kermanshah with a force mainly composed of levies which expelled the British colony. The German consul at Kermanshah engaged levies and carried on a vigorous propaganda; he also drove back the British and Russian consuls when they sought to return under Persian escort. At Isfahan, Pugin, dressed as a Persian, with the profession of Islam on his lips, persuaded the credulous citizens and their religious leaders that the Kaiser was indeed a *hajji* or pilgrim to Mecca. Assassination was deliberately employed. First the Russian vice-consul was murdered and, later, the British consul-general was wounded and his Indian orderly killed. A letter from a German official, Seifer, was subsequently intercepted, in which he gloried in having arranged this cowardly stroke. Farther E. at Yazd, enemy parties looted the treasury of the Imperial Bank of Persia, a British company, and drove out the colony; and, at Kerman, similar action was taken, together with the assassination of a prominent British subject. At the end of 1915, seven out of the seventeen branches of the Imperial Bank were in enemy hands and the British colonies had been expelled from central and southern Persia. Only the Gulf ports remained safe, thanks to British sea-power and garrisons.

In the N. the position was very different. Owing to the danger to which the Allied legations were exposed, Russian troops had landed at Enzeli in May and had marched to Kazvin whence, as the situation grew more menacing, they had advanced to the Karaj river, some 25 m. W. of Teheran. This movement produced a crisis. The enemy ministers perforce had to leave Teheran and, as the Persian Foreign Minister was on their side, they felt sure of persuading the young Shah to follow them. Indeed, the dilemma of Sultan Ahmad was painful. On the one side, the enemy ministers warned him that Teheran would be stormed by the Russians, who would seize and probably kill him; on the other side the British and Russian representatives pointed out to His Majesty that if he left the capital and broke his neutrality by joining the ministers of the Central Powers, he might lose his throne. Finally the Shah decided to remain at Teheran. The enemy ministers retired to Qum, where they employed their forces in somewhat aimless raiding. This was soon stopped by Russian columns, and, before the end of the year, Russian troops had occupied Kashan and were threatening Isfahan.

**German Missions to Afghanistan.**—One of the dangers to be guarded against was that of German missions to Afghanistan and Baluchistan. Efforts were made to intercept such parties, but it took time to make the necessary arrangements, and it was not until 1916 that the eastern Persian cordon was in working order with the Russians patrolling the frontier as far S. as Kain, from which centre the British, with some regular troops and a number of locally raised levies, were responsible to the borders of Baluchistan. Persia being a land of vast distances, it is not surprising that a German mission was able, by means of very long marches, to reach Herat in safety. It was received with every honour, but displayed extraordinary lack of tact by openly decrying everything of Afghan manufacture, the arms manufactured at the arsenal at the capital, for instance, being criticized contemptuously. At Kabul too, the same behaviour brought the mission into trouble. The Amir, who had received it courteously, delayed matters by summoning a council representative of all the tribes and by lengthy meetings with the mission and his own advisers. The Germans gradually realized that, without a Turkish force, their efforts were wasted. They were finally dismissed, the Amir pointing out that he could hardly break with the Government of India until a large, well-equipped army reached Kabul from the west. The mission broke up into small parties, most of which successfully evaded the cordon. Other missions travelling farther S., including one to Bahram, Khan of Bampur, had no success whatever, the greedy Baluch in the last-named case stripping the enemy agents who were glad to escape with their lives.

**Russo-Turkish Struggle in Western Persia.**—In 1916 the ebb and flow of the struggle were very marked in western Persia. At first the Turks, shortly after the retreat of the British from Ctesiphon, occupied Kermanshah and pushed forward towards Hamadan. The Russians in their turn, justly elated at their astounding feat of arms at Erzerum, advanced and drove the enemy off the plateau, while a second force swept the hostile Bakhtiaris out of Isfahan and brought back the British and Russian communities. The capture of Kut again transformed the military situation and, in the summer, the Turks, 16,000 strong with 54 guns, gradually drove back the Russians who could only oppose them with 12,000 men and 19 guns. Kermanshah was evacuated and then Hamadan, the retreat continuing as far as the Sultan Bulak range which covered Kazvin and threatened a force marching on Teheran. This situation remained unchanged until the end of the year.

**Raising the South Persia Rifles.**—In 1916, it was decided, in consultation with the Persian Government, to organize a force of Persian troops to restore order in southern Persia and take the place of the Swedish gendarmerie. This force was to be 11,000 strong and the Cossack brigade was to be raised to a similar strength. Brig.-Gen. Sir Percy Sykes, who had spent many years in S. Persia, was appointed to undertake this task and landed at Bandar 'Abbas in March, with three other British officers and a few Indian instructors. The state of affairs was most unfavourable as, apart from the defeat of Qawam, the British agent and his escort were assassinated at Lingeh and two British officers were assassinated in Makran about the same time, both murders being due to German instigation; and finally this terrible month of April saw the grave disaster of Kut al Amara. Many experienced men expected a wave of fanaticism to sweep across Persia and there was certainly cause for deep anxiety, especially in Makran, but British coolness undoubtedly saved the situation. Recruiting operations at Bandar 'Abbas were started immediately after landing and, in spite of a strong anti-British party, men were rapidly enlisted and, before the end of a month, the Persian flag was hoisted with ceremony over a camp. The force, handled with much tact and patience by its British and Indian instruc-

tors, never looked back and was soon able to protect Bandar 'Abbas and an important section of the caravan route from the raiding tribesmen.

*The Success of Qawam el Mulk and his Sudden Death.*—Qawam was aided by the British with money and munitions, and an exaggerated report of the means placed at his disposal led to the rebel Arab headmen kissing his feet. With their aid he defeated the Swedish gendarmerie, and was marching in triumph to Shiraz when he was killed by a fall from his horse. His son, a man of 28, was however able to restore Persian authority in Fars.

*The March of Sir Percy Sykes to Kerman.*—The success of Qawam and the landing of the mission at Bandar 'Abbas made the position of the German parties at Kerman decidedly insecure. The governor-general became hostile to them and they decided to retire westwards to Fars, the route farther N. being dangerous owing to the Russian advance southwards. They fled in two parties, and after suffering some losses from attacks on the road, were all captured by Qawam and imprisoned at Shiraz to the number of 60 Germans and Austrians, a dozen Turks and a few Afghans. A small force of Indian troops, consisting of a section of mountain guns, a squadron of cavalry and 500 rifles, was sent to Bandar 'Abbas and Sir Percy Sykes marched inland a distance of 280 m. to Kerman, where he was received with much cordiality. The various pro-German elements who had created a state of insecurity fled, the bank and telegraph offices were reopened, and the normal state of affairs was very quickly reestablished. At Kerman, recruiting for a brigade of the S. Persia Rifles was started with much success, and, before long, it was dealing effectively with the robber bands which were destroying life and property in the province. The column, after halting for some weeks, marched on to Yazd, where the British colony had only recently returned. News being received of the Turkish advance and of a probable attack on Isfahan, the column, instead of marching direct to Shiraz as originally intended, proceeded to Isfahan and joined the force of 600 Russian Cossacks at the ancient capital of Persia. The Turkish force had reached Dunbeni, 60 m. to the N.W. of Isfahan, but had not advanced any further, and it appeared that exaggerated rumours as to the size of Sir Percy Sykes's force had been the cause of this change of plan. During the halt at Isfahan, the column marched out for 50 m. along the Ahwaz route, attacked Jafar Kuli, a noted brigand, who was holding it, and provided an escort for loads of British merchandise that had been lying at Kava Rukh for many months. Altogether 16,000 loads were brought in, and incidentally several merchants were saved from bankruptcy. When it finally became evident that the Turks would not advance on Isfahan, the column marched S. to Shiraz, which it reached in Nov., thereby completing a march of 1,000 m. through the heart of Persia.

*Taking over the Swedish Gendarmerie in Fars.*—At Shiraz the question of the gendarmerie had to be settled. The Persian Government had not actually given its consent to it being incorporated in the S. Persia Rifles, but was unable to pay or equip the force. Spread over the route for a distance of 300 m. from the borders of Fars in the N. to Kazerun in the S. and numbering some 3,000 men, the problem which confronted Sir Percy Sykes was one of extreme difficulty. He had no staff to administer or train such large numbers and he was aware that it was this force which had seized the British consul only a year previously and that many of the officers were pro-German in sentiment. But he also realized that, if the gendarmerie broke up into well-armed bands of robbers and devastated the country, few supplies would reach Shiraz. He consequently addressed the officers, explained to them that they were to be absorbed into the S. Persia Rifles, and expressed the hope that they would serve Persia loyally by helping to put down the brigandage that was slowly but surely extirpating the sedentary population. In March 1917, this action was indirectly approved by the Persian Government, which officially recognized the S. Persia Rifles. The men were in rags, half-starved and undisciplined. It was impossible to take them off the road immediately, as there were no barracks for them at Shiraz. It was a case of feeding, clothing and paying the men at first and of gradually restoring the discipline that appeared to be almost lost. With only three or four British officers available, much was done, and when a proper staff reached Shiraz in the spring of 1917, rapid progress was the order of the day.

*The Restoration of Order in Southern Persia.*—Since the assassination of Nasir ed Din in 1896, the authority of the Persian

Government had weakened year by year, and in Fars the governor-general had been at the mercy of the powerful Kashgai tribe. Under their capable chief, Solat ed Dauleh, these powerful nomads numbering 130,000 tribesmen, and moving in their migrations from the Persian Gulf to Qumishah, dominated the province, of which Solah (Solat) was the "uncrowned king." They were armed with Mausers, had plenty of ammunition and displayed great bravery in the field. Solah collected the revenue in full from his tribesmen, but paid nothing to the Persian Government. He also sent powerful raiding parties throughout the greater part of the province, which looted and levied blackmail. If a governor-general attempted any opposition to Solah, the latter promptly prevented supplies and goods from reaching Shiraz. The result was scarcity in the bazaars and discontent, followed by riots, and the governor-general returned to Teheran. It was obvious that Solah would be hostile to the British. The Kashgais considered that raiding was their right and would combine against anyone who attempted to put an end to it. Generally speaking, they held western Fars at their mercy and, farther E., lay the territory of the Khamseh Arabs, who were 70,000 strong. Under their chief, Qawam el Mulk, they ranged from the neighbourhood of Bandar 'Abbas and Lar to the vicinity of Niriz and Dehbid. The Arabs were less well-armed than the Kashgais but were equally brave. They were also equally addicted to looting. The marked difference between the two chiefs was that Qawam was a polished Shirazi, anxious to improve the state of Fars, although he could not immediately stop looting, whereas Solah lived with his tribesmen all the year round and had the same mentality. Sir Percy Sykes met Solah, with whom an agreement was made to prevent his tribesmen from looting, and, although it was realized that he was thoroughly untrustworthy, he refrained from attacking the British during 1917, and allowed them time to open up communications and construct forts at Saidabad (Sirjan) and Niriz. With Qawam good relations were maintained throughout.

In the summer of 1917, a force of Indian troops was stationed at Dehbid which, by the infliction of a single salutary punishment, made the main route safe, and caravans once again began to pass. In the autumn, combined operations against tribes marked down for punishment were undertaken by the Fars and Kerman columns. So successful were they that, had there been no interruption, S. Persia would have rapidly settled down to comparative prosperity. But the reaction of the World War was destined to be felt still more strongly than before in remote Fars.

*Successful Russian Campaign in Western Persia.*—The saddest year in Russian history opened with military success in Persia. As already mentioned, at the end of 1916, the Turks were occupying Hamadan and facing the Russians at Kazvin. During the winter, however, the position in Mesopotamia entirely changed. Instead of weak, ill-equipped columns, severely handicapped by unfavourable climatic conditions, failing before Kut al Amara, there was the pleasant picture of overwhelming forces under the inspiring leadership of Gen. Sir Stanley Maude recapturing Kut in Feb. 1917 and following this up by the signal success of the surrender of Bagdad to the British. The position of the Turks in Persia became more and more difficult as the British advanced. On the day Bagdad was occupied they evacuated Kermanshah and, pursued by the Russians, reached the Persian frontier at Qasr-i-Shirin on March 31, worn out and hungry but not wholly demoralized. Meanwhile the British had despatched two brigades to the Jebel Hamrin, but found the range occupied in great force by the Turkish 18th corps, which did not retire until the 13th corps had evacuated Persian soil intact, when the united forces moved northwards. On April 2, a squadron of Cossacks met the British at Qizil Ribat, but marched back the same night. There was no question of maintaining contact, but the British helped their allies to establish themselves firmly on the Diala river.

*The Russian Collapse in Persia and its Results.*—March 1917, which witnessed the capture of Bagdad, also saw the abdication of the Tsar. Gradually the Russian troops in Persia became demoralized and, during the winter of 1917-8, the rot had set in and hordes of Russians made for home, plundering the villages for food, pulling down houses to secure timber for fuel and selling

arms, ammunition and equipment for a meal. Horses went for a few shillings, but this movement had completed the denudation of western Persia, already suffering from serious scarcity of forage, so that there were few buyers. Briefly, famine conditions prevailed in W. and N.W. Persia, and indeed in the other provinces. Such was the local position, but the world-results were still more serious. While Russia was fighting on the side of the Allies, her army stretched southwards from the European front across the Caucasus and N.W. Persia until, as we have seen, its extreme left flank, in 1917, touched the right flank of the British army in Mesopotamia, and thereby effectually prevented our enemies from approaching the frontiers of India. The ambitions of Germany to reach the Persian Gulf and India by that potent instrument, the Bagdad railway, had been rendered nugatory by the capture of Basra; but the collapse of Russia opened up a completed line of northern advance across the Caucasus and the Caspian Sea to 'Ashqabad, Merv (the junction for Kushk, within striking distance of Herat), Bukhara, Samarkand, and Tashkent, the administrative centre of Russian Turkestan. Over 100,000 German and Austrian prisoners were in Central Asia and, when through communication had been established, it would have been easy to reorganize these veterans and march on Kabul, with an invitation to the Afghans to share in the plunder of India.

When the Russian Empire proved to all the world its utter rottenness, Georgia and Armenia decided to claim their independence, and a third state came into being under the title of the republic of Azerbaijan, with Baku as its capital. In connexion with efforts made to ward off this terrible threat to India, British troops entered western Persia.

*The Dunsterville Mission.*—It was out of the question to dispatch large bodies of troops to support the Georgians or Armenians, as Bagdad was 800 m. distant from Baku. The authorities therefore decided to dispatch a military mission to reorganize the sound elements of the country into a force that would prevent the Turks and their German masters from reaching Baku. It was hoped that these small states would fight for their homes, but the Armenians absolutely failed to do this. Maj.-Gen. L. C. Dunsterville was appointed to command this mission, and, in Feb. 1918, he started off from Bagdad with a party of officers in 40 cars to cross N.W. Persia. Enzeli was his objective, and he hoped from that port to be able to proceed to Baku and Tiflis. He reached Enzeli only to find that the port and its shipping were in the hands of hostile Bolsheviks, while the neighbourhood was dominated by Mirza Kuchik Khan, an ambitious brigand who had recruited some 4,000 followers, nicknamed *Jangalis* or "Forest Dwellers," to the cry of "Persia for the Persians" and who robbed his countrymen if they refused to join him. Dunsterville quickly realized the situation, and, before his opponents had concerted their plans and had overcome their fear of the armoured motor-car, the mission had retired to Kazvin and Hamadan, which latter city became its headquarters. During this period, Dunsterville was brought into close relations with the Russian generals Baratov and Bicherakov. The former had commanded the Russian troops in northern Persia and was now helplessly watching their disintegration. The latter, on the contrary, had kept his command of 1,200 men practically intact. By March, the last of Baratov's men had left, but Dunsterville had been able to keep Bicherakov's command at his side. Without its aid, the *Jangalis*, elated by the retirement of the mission which was magnified into a great victory over a British army, would have been able to march on the capital. There they would probably have introduced a reign of anarchy and have forced Persia into the war on the side of the Central Powers, with whom Kuchik Khan had close relations, and also German, Austrian and Turkish instructors, well supplied with machine-guns. When the *Jangalis* marched on Kazvin, Bicherakov forestalled them and drove them back to the forests with heavy losses. He then embarked at Enzeli. Dunsterville, who had received reinforcements consisting of a regiment of cavalry, a battery and two regiments of infantry, followed behind Bicherakov and took over the road. The *Jangalis*, under their European officers, attacked a detachment at Resht, but suffered heavy losses, and Kuchik Khan made

terms and became a contractor for supplies. About this time, the Bolshevik Government at Baku was overthrown and replaced by the Central-Caspian Dictatorship, which asked for British assistance. Dunsterville took his force to Baku, held it for some weeks against overwhelming Turkish numbers, denying the use of the oil wells to the enemy, whom he also kept away from the Caspian Sea, and finally evacuated the town and returned to Enzeli, thus ending a very gallant episode of the war.

During the early autumn of 1918, more troops were moved up into N.W. Persia to prevent the threatened Turkish advance from Azerbaijan, the plan being to hold the Schneh Bijar-Zenjan-Enzeli line. Actually the threat came to nothing, but a brigade of British troops was kept at Kazvin to protect Persia against the Bolsheviks and to prevent the main route into Persia being closed. In March 1921, it was under orders to withdraw.

*The Flight of the Assyrian Christians from Urmia.*—Among the picturesque incidents of the World War, the rallying of the Assyrian Christians to the Russians, their migration to Urmia and their determined bravery in the face of enemies threatening to overwhelm them, have already been described. In the summer of 1918, an attempt was made by the British to help them with munitions and money, and a party of the refugees broke through the weak Turkish lines to receive the proffered aid. Unfortunately, false rumours of a disaster reached the main body of tribesmen who, collecting their families and flocks, fled panic-stricken to Bijar, pursued by Persians, Turks and Kurds. Every effort was made by the British to aid the refugees, but many fell on the road, by the sword and from hunger and fatigue, before the tribe, reduced to half its original number, was in safety. This flight eclipsed in dramatic interest that of the Torgut Mongols, so vividly described by De Quincey.

*Military Mission of Maj.-Gen. Sir Wilfrid Malleson.*—Not content with trying to head off the Turks at Baku, a second mission was despatched along the newly completed Nushki-Duzdab railway and then through Seistan and Meshed to Transcaspia to support the Turkoman and Russians who, under the title of *Menshevists*, were attempting to stem the flood of Bolshevism. Eastern Persia constituted part of the lines of communication of the mission, and there were no hostilities with the inhabitants, who, on the contrary, appeared to have realized the advantages of having a good route opened up through their country by a force which paid fair prices for everything it bought. Many gallant deeds were done by the small British detachments fighting along the Central Asian railway, and also by the force under Commodore D. T. Norris who, operating from Krasnovodsk, drove the Bolshevik flag off the Caspian Sea.

*The Investment of Shiraz by the Kashgais.*—In the spring of 1918, the Persian Government, in reply to a British note, denounced the S. Persia Rifles as a foreign force and a threat to Persian independence and integrity. It also expressed the hope that the British Government would withdraw its troops and allow Persia to commence her cherished reforms. Characteristically enough, while denouncing the conditions, it readily accepted the proffered financial help. The Cabinet was under the impression that Germany was winning the World War or else such a curt note would have never been penned. This reply was published all over southern Persia to the discouragement of our friends and the elation of our enemies. The results were speedily shown in serious desertions from the S. Persia Rifles and culminated in the formation of a confederacy under the Kashgai chief to annihilate the British in southern Persia. The date of an attack on the Indian troops at Shiraz was fixed by the grazing which would allow the nomads to keep their flocks in the neighbourhood, and, as there was a month to spare, Sir Percy Sykes despatched a column to deal with some raiding tribes in the vicinity of Niriz, which were known to have joined the Kashgai confederacy. These operations were successful and the small Indian detachment at Niriz was unmolested when the storm broke.

The day the column returned to Shiraz, Solah wrote that, by the orders of the Persian Government, he was about to take action for the defence of Islam against the "unauthorized force" of the S. Persia Rifles. He had at his disposal 4,500 Kashgais and 1,500 Kazerunis and this number was reinforced by contingents from Dashti, Dashtistan and elsewhere, and reached about 8,000 fighting men. The tribesmen were well armed with Mausers, had plenty of ammunition, and fought both bravely and

cunningly. The British force at Shiraz was 2,200 strong, one-third being recruits. The S. Persia Rifles slightly outnumbered the Indian troops and, owing to propaganda and the proclaimed hostility of the Persian Government, were a danger to the British. The detachments in the outposts mutinied and surrendered or deserted. Qawam had collected 2,000 Arabs in and about Shiraz, who were ready to attack the beaten side. On May 24, the day after the return of the column, it marched out under Col. E. F. Orton, 1,600 strong, and attacked the Kashgais in the hilly country to the W. of the city. The resistance of the enemy was obstinate, but the Indian troops gradually moved forward, defeating rush after rush and, after 14 hours' fighting, occupied Solah's camp on the bank of the Qara Aghach river. The Kashgais fled headlong at the end of the action, in which they had suffered some 700 casualties, as against 51 in the British column. About ten days later the enemy returned in still larger numbers, and the Kazerunis occupied the garden quarter, which almost touched the fortified perimeter constructed by the British outside Shiraz. In June, the investment became closer, as the British withdrew an outpost which was dangerously isolated. The inhabitants of Shiraz were incited against the British by the *mullas*, some of whom preached *jihad* or Holy War. Sir Percy Sykes learned that the Kashgais were preparing to unite with the townspeople in a combined attack on June 17, and he determined to forestall them. Accordingly, on June 16, the column sallied out for 4 m. and then slowly retired drawing the Kashgais down on to the plain where they offered good targets to the guns. The column then returned to Shiraz. On the following day, Shiraz rose, its inhabitants attacking everyone suspected of being friendly to the British. But the Kashgais, whose losses had again been heavy, did not come to the support of the townspeople, who were overawed by the seizure at midnight of various key-positions by the British. The tide then turned. The governor-general appointed a new *Ilkhani* or "paramount chief" in place of Solah, whose followers began to break away, influenced by the heavy losses they had suffered. Qawam declared in favour of the new *Ilkhani*, and his example was followed by a brother of Solah who was followed by perhaps one-quarter of the tribe. The column marched out again, and Solah fled a broken man, pursued by Qawam, the new *Ilkhani*, and most of the Kashgai tribe.

*The Siege and Relief of Abadeh.*—Meanwhile the S. Persia Rifles at Abadeh, a town situated between Shiraz and Isfahan, had mutinied. The British officers took refuge with a company of 16th Rajputs, who held the small fort against overwhelming numbers. Within 36 hours of the final defeat of Solah, the victorious column marched northwards and, after a forced march of 180 m. in 169 hours, relieved Abadeh.

*The Final Defeat of the Kashgais, Oct. 1918.*—The new *Ilkhani* had no easy task in establishing his position and was besieged in his fort by the fickle tribesmen, who changed sides whenever it appeared to be to their interest to do so. The column rapidly marched S. and gave the Kashgais a final overthrow, the Burma Mounted Rifles counting 103 corpses. Solah fled weeping, and has been a refugee ever since. The night after this final success, both victors and vanquished were prostrated by the deadly influenza epidemic. The losses were appalling, 18% of the Shiraz force dying. The inhabitants of the city lost even more heavily. Indeed, the country generally suffered terribly, the scourge carrying off the young and able-bodied and sparing the old.

*The Opening of the Bushire-Shiraz Route.*—When Sir Percy Sykes was invested at Shiraz, the small force of Indian troops at Bushire was strengthened and arrangements were made for organizing a base with a view to an advance in October. In the autumn, influenza broke out, but the type was fortunately mild, the losses being only 2%. The force engaged in opening up the road included no fewer than 20,000 fighting men and followers and, as there was no fear of serious opposition after the final defeat of Solah, the operation was mainly one of constructing a good camel track up the infamous passes and of feeding the force. A railway was laid to Borazjan, 37 m. distant, across the level plain and thence carts plied to the foot of the passes. Kazerun was finally reached on Jan. 27 1919, the Shiraz column cooperating by marching over the passes to within a few miles of that town. The beneficent activity of the British was continued, and, when the troops withdrew in the spring of 1919, a good track, over which a car could run, albeit with great difficulty in

a few places, had been constructed from Bushire to Shiraz. Unfortunately this route will require constant repair to keep it in good order, and it is unlikely that the Persian Government will do this. The result of these operations was entirely beneficial to the Persian Government. The Kashgais, who had had each successive governor-general at their mercy, were cowed and dispirited and it would have been easy to control S. Persia. But the Persian Government, as at present constituted, cannot maintain law and order.

*Persian Delegation to the Peace Conference.*—In 1919, a Persian delegation reached Paris in order to lay its claims before the Peace Conference. These claims were divided into three parts, dealing respectively: (a) with political, juridical and economic independence; (b) with right to territorial restorations; and (c) with right to reparations. Heading part (a) was the Anglo-Russian agreement of 1907, the abrogation of which was rightly demanded and was conceded so far as concerned Great Britain. Other demands, such as the abolition of consular courts and the withdrawal of consular guards, are entirely out of the question until Persia sets her own house in order and can guarantee order, security, and a pure administration. The territorial claims were extravagant, including Transcaspiia, Merv and Khiva to the E., the Caucasus as far N. as Derbent and, westwards, Kurdistan, Diarbekr and Mosul. The claims for reparation stood on a different footing, as the W. and N.W. provinces of Persia undoubtedly suffered terribly from the ebb and flow of the contending armies, the retreat of the demoralized Russians and the flight of the Assyrian Christians. It is to be regretted that the delegation could not be permitted to lay its case before the Peace Conference, even though its claims were extravagant. Actually the Cabinet, which had despatched the delegation, fell and a representative of the new Cabinet laid the case of Persia before the Supreme Council.

*The Anglo-Persian Agreement 1919.*—In the summer, after negotiations extending over a period of nine months, two Agreements were signed at Teheran, the first of which was as follows:—

PREAMBLE: In virtue of the close ties of friendship which have existed between the two Governments in the past, and in the conviction that it is in the essential and mutual interests of both in future that these ties should be cemented, and that the progress and prosperity of Persia should be promoted to the utmost, it is hereby agreed between the Persian Government on the one hand, and His Britannic Majesty's Minister acting on behalf of his Government on the other, as follows:—

1. The British Government reiterate, in the most categorical manner, the undertakings which they have repeatedly given in the past to respect absolutely the independence and integrity of Persia.

2. The British Government will supply, at the cost of the Persian Government, the services of whatever expert advisers may, after consultation between the two Governments, be considered necessary for the several departments of the Persian Administration. These advisers shall be engaged on contracts and endowed with adequate powers, the nature of which shall be the matter of agreement between the Persian Government and the advisers.

3. The British Government will supply, at the cost of the Persian Government, such officers and such munitions and equipment of modern type as may be adjudged necessary by a joint commission of military experts, British and Persian, which shall assemble forthwith for the purpose of estimating the needs of Persia in respect of the formation of a uniform force which the Persian Government proposes to create for the establishment and preservation of order in the country and on its frontiers.

4. For the purpose of financing the reforms indicated in clauses 2 and 3 of this agreement, the British Government offer to provide or arrange a substantial loan for the Persian Government, for which adequate security shall be sought by the two Governments in consultation in the revenues of the Customs or other sources of income at the disposal of the Persian Government. Pending the completion of negotiations for such a loan the British Government will supply such funds as may be necessary for initiating the said reforms.

5. The British Government, fully recognizing the urgent need which exists for the improvement of communications in Persia, with a view both to the extension of trade and the prevention of famine, are prepared to cooperate with the Persian Government for the encouragement of Anglo-Persian enterprise in this direction, both by means of railway construction and other forms of transport; subject always to the examination of the problems by experts and to agreement between the two Governments as to the particular projects which may be most necessary, practicable and profitable.

6. The two Governments agree to the appointment forthwith of a joint Committee of experts for the examination and revision of the existing Customs Tariff with a view to its reconstruction on a basis calculated to accord with the legitimate interests of the country and to promote its prosperity.

Signed at Teheran, August 9, 1919.

The second Agreement defined the loan, which was fixed at £2,000,000 at 7%, redeemable in 20 years. There were two letters, in the first of which the British Government promised co-operation in securing a revision of the treaties actually in force between the two Powers, compensation for damage suffered during the war, and any justifiable rectification of frontiers. In the second it was laid down that Great Britain would not claim from Persia the cost of maintaining British troops in Persia for the defence of her neutrality, and asked Persia, in return, not to claim compensation for any damage done by her troops.

The Agreement was signed, but no immediate steps were taken to elect a new Majlis and submit it for ratification. In consequence, everything was held to be in suspense.

**Finance.**—In 1920 a British Financial Adviser was engaged by the Persian Government, a member of the Treasury staff being selected for the post. To a certain extent he could occupy himself with superintending the payment of money in connexion with the Cossack brigade and other matters in which help was given to the Persian Government, but his office was in suspense and the loan of £2,000,000 could not be made until the Agreement was ratified. With all overdue instalments paid up, the total debt of Persia as at Dec. 31 1920 was as follows:—

Loans	Original Amount	Outstanding
1. Russian 5% Loan of 1900, 1902 (Rubles)	32,500,000	31,223,170
2. Russian Consolidated 7% Loan 1911 (Krans)	60,000,030	31,524,501
3. Indian 5% Loan	£314,281 16s. 4d	£180,421
4. Imperial Bank of Persia 5% Loan of May 8 1911	£1,250,000	£1,233,061
5. British Advances of 1912-4, 7%	£490,000	£490,000
6. Russian Advances (Rubles)	1,801,500	1,576,250
7. British Advances 1915-7	£817,000	£817,000
8. " " 1917 (Krans)	1,000,000	1,000,000
9. " " 1918 (Krans)	—	92,500,000
10. British Loan, Aug. 9 1919	£2,000,000	Not yet received.

**The Anglo-Persian Military Commission.**—Among the important questions was the formation of a uniform force for Persia. An Anglo-Persian Commission was appointed and recommended a total strength of 60,000 men. As funds for such a force were not immediately available, it was decided to absorb the S. Persia Rifles, 6,000 strong; the Cossack division, 8,000 strong; and the Swedish gendarmierie, 8,400 strong. The total force would be gradually raised to 40,000 and all other troops would be disbanded. The Chief Military Adviser would be British and the Chief of the General Staff a Persian, although there was no Persian officer who possessed the qualifications. This scheme was in abeyance in 1921, pending ratification of the Agreement.

**The Bolshevik Invasion of Persia.**—In May 1920 the Bolshevik fleet from Baku bombarded Enzeli, took possession of the remnants of Denikin's squadron and leisurely occupied Resht, where a Provisional Government was formed under Kuchik Khan. The British detachment at Enzeli was withdrawn to Kazvin. At Teheran there was a panic and the British were blamed for not protecting Persia. The Cossack brigade recaptured Resht some months later, but finally retreated in a demoralized condition and took refuge inside the British lines. In March 1921 there was a considerable Bolshevik force in the province of Gilan, but it was thought unlikely to prove a serious threat to Persia until the brigade of British troops should be withdrawn from Kazvin.

**Railways.**—The question of railways has loomed large in Persia partly from the political and strategical and partly from the commercial point of view. For many years Teheran had been the unsuccessful hunting-ground of seekers for concessions, who had finally been replaced by the representatives of Great Britain and Russia. It may be readily granted that the only satisfactory solution of the problem of transport in Persia lies in the construction of railways. Their influence would probably help the country to pass quickly from the methods of transport used by the patriarch Job to those of the 20th century. But there are many difficulties to be surmounted before railways can be constructed in Persia, the chief obstacles being financial and political.

Persia is a vast but miserably poor country with a scanty population living in isolated villages, generally lying many miles apart. The towns are small and do not increase, and there is very little trade. In the N the country is more fertile, owing partly to a heavier rainfall, and there are important exports as well as imports, whereas in the S, if we except oil, there are practically no exports, carpets, pistachio nuts, opium, hides and wool making a small total compared with the large imports. In other words, unless minerals are found which it is profitable to export, Persian railways, constructed in the S. or W., cannot pay.

Had the Russian Government continued on the old lines it is probable that money would have been found for the construction of a railway across Persia. The grandiose scheme appealed to the Tsar, while his ministers considered that it would secure their hold on the Russian sphere and also bring them closer to the Indian Empire, thereby enabling them to exercise pressure on Great Britain. These facts were fully realized by the British Government, which was, however, unable to refuse to discuss the scheme and, in 1912, a *Société d'Etudes*, including British, Russian and French representatives, was formed, with the object of constructing a Trans-Persian railway. It was intended, in the first instance, to build a line to Teheran, starting from Alyat, a station to the S. of Baku. Negotiations in connexion with this, the first section of the Trans-Persian railway, were carried on until the outbreak of the World War. In addition to this important scheme the Russian Government in 1913 obtained a concession for the construction of a line to Tabriz, starting from the terminus of the Trans-Caucasus system at Julfa. This concession included rights for a service of steamers on Lake Urmia to which a branch was to be run, and also a concession for an extension to Kazvin. The line to Tabriz was opened in 1916.

Meanwhile the British had not been idle, and a syndicate, of which Messrs. Greenway & Lynch were the leading members, submitted to the Persian Government a scheme for the construction of a network of railways in southern Persia: (a) from Mohammerah or Khor Musa to Khurramabad and Burujird; (b) from Bandar 'Abbas to Kerman; (c) from Bandar 'Abbas to Shiraz; and (d) from Bandar 'Abbas to Mohammerah. This far-reaching scheme for a monopoly of railway construction in S. Persia included the right to develop ports where necessary. It also involved the issue by the Persian Government of bonds secured on the railways and their earnings and on any other available sources of revenue.

The syndicate decided to begin work on part (a) of the scheme. The base would probably have been Khor Musa, an inlet of the sea, which ran inland for many miles towards the Karun river and possessed remarkable advantages, in the way of deep water and safe anchorage. The alternative was Mohammerah. The line would have been constructed across the level plain of Arabistan to Dizful and would then have risen through the hills to Khurramabad. Survey operations were attempted in the hills in 1913, but the greedy tribesmen attempted to levy such enormous sums for protecting the parties that the work came to a standstill. The results of the World War have entirely changed the position and it seems that this scheme will be allowed to fall into abeyance.

There is no doubt that if railways are constructed into the interior from the Persian Gulf, the port of Bandar 'Abbas, or perhaps a new port some miles to the W., will be selected. The route running across the Rudbar district and thence to Rigan and Kerman, over the low Rigan pass, avoids the very high passes to the S. of Kerman and, once the plateau is struck at Rigan, the country is ideally suitable for railway construction right across Persia. Upon the whole, this is the most satisfactory alignment. The route from Bandar 'Abbas to Shiraz and thence to Mohammerah would violate the principle that lines should be built into the interior and not run parallel to the coast, where they could not compete with sea transport.

After the World War the question of railways was again taken up by a strong group, which included Sir Charles Greenway, the chairman of the Anglo-Persian Oil Company. The scheme included a railway to Teheran from the Persian frontier at Kuraitu, at which point was the terminus of a metre-gauge line from Bagdad. A survey was commenced via Kermanshah, Hamadan, Kazvin and Teheran. Surveys to Enzeli and Tabriz were also contemplated. It was agreed that, upon the completion of the surveys, the Persian Government would have the right to call on the group to construct the railway line or lines either as a Persian State railway or as a private company. No agreement as to terms was drawn up.

Dunsterville, *The Adventures of Dunsterforce* (1920); Prof. Williams Jackson, *Persia, Past and Present* (1906); Lt.-Col. Sykes, *The Glory of the Shia World* (1910). (P. M. S.)

**Medical Conditions.**—Persia is divided up into a great elevated plateau which occupies the chief part of the area of the country and which is separated from the Caspian Sea in the north by a low-lying narrow strip of land from 20 to 60 m. broad, and from the Persian Gulf in the south by a strip of land little above sea level and about 40 m. in width. The strip of country bordering the Caspian Sea has a very high rainfall, its climate is damp and very relaxing, the temperature being moderate. Marshy and swampy areas with luxuriant forests and vegetation occupy a considerable portion of this part

of Persia. Mosquitoes, including the *Anopheles* varieties, are very numerous, and insect life is abundant. Malaria is very common, and few residents escape infection. The medical conditions prevailing here are those which are found in other damp relaxing climates with no great extremes of temperature. Tuberculosis is fairly common, and respiratory diseases such as bronchitis, pneumonia and influenza are prevalent. There is great overcrowding in the towns, and owing to the lack of adequate sanitation water-borne diseases such as dysentery, enteric fever and cholera are prevalent. Typhus and smallpox and the ordinary infectious fevers are common. Heat stroke does not occur, but owing to the high humidity the climate is very oppressive and trying to European residents.

The plateau region of Persia, occupying almost the whole area of the country, is divided into a mountainous portion which covers the whole of the western half of Persia, the general level being from 3,000 to 6,000 ft. above the sea, while the remaining portion of the plateau is chiefly desert and its general level is from 2,000 to 3,000 ft. above the sea. The climate of the Persian plateau is temperate, the summer temperatures not exceeding those of England. The winter temperature depends largely on the altitude, and extremes of cold are experienced. The atmosphere is invigorating and healthful, but in spite of this diseases of various kinds are prevalent owing to the lack of sanitary precautions. Water-borne diseases such as enteric, dysentery and cholera are prevalent, and this is largely due to the extraordinary fondness of the Persians for conveying water through numerous channels both above and underground in the towns and villages. The water usually comes from mountain springs and is clear and sparkling, but becomes contaminated in the course of distribution. No water should ever be drunk from these channels without previous boiling or chlorination; the remarks made in the article on MESOPOTAMIA relating to protection from water-borne diseases apply with equal force to Persia. Prophylactic inoculation with T.A.B. vaccine is essential as a protection against enteric. Malaria is very common owing to the breeding of mosquitoes in the various streams and water channels. The malaria is very frequently of the malignant type, and is often not controlled by the oral administration of quinine. The intramuscular or intravenous administration of the drug should always be adopted in such cases for the first few days of treatment, after which a full course of treatment by the mouth should be given. It is very remarkable to find malaria so prevalent and of so malignant a type at such a high altitude as that of the Persian plateau.

Overcrowding and herding together of the poorer classes of the population occur especially in the cold months, for housing accommodation is very insufficient. In consequence of this the common infectious fevers and smallpox are prevalent. Tuberculosis and influenza are rife, and the lice-borne diseases, typhus and relapsing fever, are of common occurrence.

A special type of relapsing fever occurs along the Zenzan-Tabriz route, which is spread by a large tick (*Argas Persicus*) known as the "Mianeh bug," which has a great predilection for foreigners; this disease is very common at Mianeh and resembles clinically the lice-borne relapsing fever.

Eye disease is as common in Persia as Mesopotamia, and is due to the same causes. Sand flies are common and sand-fly fever is of frequent occurrence. Oriental sores are very common and are known by the Persian name "Salek," meaning a year, which is an average time for their duration. Venereal diseases such as gonorrhoea and syphilis are common amongst the natives.

Diarrhoeal diseases are very common in Persia, being spread by contaminated water, and food infected by dust and flies. These cause a very high infantile mortality amongst the natives. Neurasthenia and mental breakdown sometimes affect residents in Persia, the high altitude of the plateau being probably a causative factor.

In consequence of the Civil War and the Turkish and Russian invasions of 1914-7 much destruction of the dwellings of the poorer inhabitants occurred, and the animal transport so essential for the conveyance of food was greatly reduced. The food supplies were largely used up, and a serious famine occurred in 1917-8. Starvation carried off large numbers of the poorer inhabitants, and those debilitated by lack of nourishment and insufficient clothing became ready victims to such diseases as malignant malaria, dysentery, typhus, etc. (W. H. W.)

**PERSIAN GULF.**—The term "Persian Gulf" is, strictly speaking, restricted to the landlocked sea which extends in a south-easterly direction from the mouth of the Shatt al 'Arab 460 m. to the mountain mass of the promontory of Oman, terminating in Ras Musandam, but, for the purpose of this article, it will be considered to include the Gulf of Oman to which it is joined by the Strait of Ormuz, 29 m. wide. The Gulf itself has an average width of 120 miles. It is tidal, spring tides rising about 9 ft.; the water is somewhat saltier than the Indian Ocean, and seldom exceeds 10 fathoms in depth; with the exception of the Shatt al 'Arab, the Jarrahi and the Hindiyan rivers, which mingle their waters with those of the sea at the W. end of the Gulf, all the streams that flow into it are so salt as to be undrinkable. The

Euphrates and Tigris have within historical times silted up their mouths to an extent that has materially altered the coast-line of the Gulf and these rivers seem destined in the future to unite El Hasa to Fao, just as in the past they produced the fertile plains of Mesopotamia. The Persian Gulf is lacking in good harbours, anchorage being mostly shallow and exposed.

**N. Coast.**—From the Indian Ocean the Gulf of Oman is entered approximately where Persian territory begins at the tiny port of Gwattar. From Gwattar the coast-line, running W., first to the Strait of Ormuz, next along the N. shore of the Persian Gulf, and finally to the mouth of the Shatt al 'Arab, is nominally under the exclusive control of the Persian Government. The inhabitants of this tract are Persians or Arabs who by domicile and intermarriage with Persians have lost nearly all their racial and most of their social characteristics, but retain a dialect of Arabic as their mother tongue.

**S. Coast.**—The S. coast on the Gulf of Oman may be regarded as commencing from Ras el Hadd; it extends to the Ras Musandam. This coast is under the nominal suzerainty of the Sultan of Muscat, the principal ports from E. to W. being Sur, Muscat, Matra, Khabura and Sohar. From Ras Musandam westwards the Arabian shore is inhabited by tribes of Arab origin, which are independent and in treaty relation with Great Britain.

Up to 1913 the Turks exercised the right of suzerainty over the maritime districts of El Hasa and Hofuf, and claimed it in Qatar and Kuwait. The Emir of Nejd, 'Abd el 'Aziz ibn Sa'ud, ejected them from the first-named districts; the war has put an end to their claims elsewhere in the Gulf. The Trucial chiefs of the Arabian coast hold sway between the peninsulas of Musandam and Qatar. From E. to W. their headquarters run as follows:—Ras el Kheima, Umm el Qaiwein, 'Ajman, Sharja, Dibai, Abu Dhabi, Qatar. The Sheikh of Bahrein exercises no authority over the mainland, which from the S. extremity of the bay in which Bahrein lies to Jebel Manifa N. of Qatif is recognized as within the territories of the Emir of Nejd (see ARABIA).

The friendly attitude of Ibn Sa'ud on the outbreak of war with Turkey made it imperative that the British Government should come to a definite understanding with him, and he was recognized by a treaty dated Dec. 28 1915, as independent ruler of Nejd and El Hasa, and given a limited dynastic guarantee, with a promise of support in case of foreign aggression. Great Britain assumed control of his foreign relations, outside Arabia. He on his part undertook not to alienate any territory to a foreign Power, except with the consent of the British Government.

Shortly afterwards a treaty was made with the Chief of Qatar, whereby his position was assimilated to that of the Trucial chiefs. The British Government undertook in addition to afford their good offices to the Sheikh in the event of unprovoked aggression by land.

**Climate.**—The prevalent winds in the Gulf follow the configuration of the coast, i.e. N.W., known as the *shamal*, and S.E., known as the *gaws*. The former wind, rising often to a gale in a few hours and falling as suddenly, is foretold by no change in the barometer. With the *gaws* the reverse is the case. This wind is much dreaded by native mariners as it strikes nearly all the sheltered anchorages.

Rainfall varies from 6 in. to 9 in., at the W. end of the Gulf to a negligible quantity at Muscat. As is to be expected, the rainfall on the peninsula is somewhat greater than on the Arab coast. The influence of the S.W. monsoon, which is marked at Muscat, is scarcely noticeable in the Persian Gulf proper, though recent upper-air investigations conducted at Bagdad give some reason to think that the effects of the monsoon can be observed even there.

The temperature at the W. end of the Gulf varies from a minimum of 4° or 5° F. below freezing point at night in winter to a maximum of 115° F. in the shade during a few days in summer; the humidity of the air at Muscat is greater and the climate is, in consequence, much more trying, but even here a maximum of 109° F. has been recorded, the lowest minimum being 55°. Snow has been known to fall at Bushire. (A. T. W.)

**Medical Conditions.**—The medical conditions prevailing in the Persian Gulf are largely determined by the peculiarly trying climatic influences to which the inhabitants are exposed. The Arabian desert forms the W. and S. shores, which are almost uninhabited except for the small centres of population around its few widely separated towns, Kuwait, noted for its pearl fisheries, in the N.W. corner, being the most important of these. The E.

1 The W. frontier of Persia was finally demarcated in 1914, a few months before the outbreak of war, by a mixed Anglo-Russian Perso-Turkish commission.

and N. shores are formed by the desert country of southern Persia, and are similarly very sparsely populated, Bushire, in the N.E. part of the Gulf, the port for the Shiraz district of southern Persia, and Bandar 'Abbas, at the entrance of the Gulf, being the chief centres of population. The hot season of the year is from May to October, July and August being the hottest months. The Persian Gulf has an unenviable reputation for its dangers from heat-stroke, and the sun's rays seem to have a peculiar deadly power in this region, for the risk of exposure is greater than in any part of the world, though other countries have a temperature which is equally high. The explanation is to be found in the extreme flatness of the country and the absence of trees or vegetation. The clear atmosphere is in its upper strata free from clouds and dust, so that the sun's rays undergo scarcely any absorption and strike down with full force on the light-brown desert soil, from which they are radiated and reflected to a great extent. The relative humidity of the air along the shores of the Gulf is high, so that exposure to the direct and reflected rays of the sun and radiation from the hot soil are encountered in a moist atmosphere.

So trying is the heat that some parts of the Persian Gulf are almost uninhabitable to natives in the hotter months. The greatest care requires to be taken by white races to avoid exposure to the sun and heat. Dwellings require careful construction, with thick walls and roofs of non-conducting material to keep out the heat-rays, and fans and punkahs are essential for the promotion of currents of air in the inhabited rooms. Personal protection, in the shape of thick pith topees, or cork helmets, and spinal pads, is necessary in the hot months, the clothing being light and loose and not too thin. Fatigue from physical exertion is a predisposing cause of heat-stroke, and constipation and alcoholic indulgence should be avoided.

Should a person be infected with latent malaria, heat exposure is very likely to induce an acute malarial attack and the combination is almost certain to lead to hyperpyrexia. On this account malarial subjects living in the Persian Gulf should take especial care to have an effective course of treatment in order to eradicate the disease as far as possible. The frequent association of heat-stroke with malaria is to be borne in mind in the treatment of heat hyperpyrexia, for, should the temperature of the patient not subside rapidly after treatment with cold sponging in a current of air or cold baths and ice, an intramuscular or intravenous injection of 10 grains of quinine bichloride should be given without delay. In the case of white people exposure to heat of itself frequently causes heat-stroke, but probably in almost all cases of heat hyperpyrexia amongst natives the malarial complication is the exciting cause and therefore with them quinine treatment is all-important. Natives are generally immune to the effects of heat apart from other complicating causes of high temperature, such as malaria, etc., whereas white races may be affected with heat-stroke from heat exposure even if in perfect health. If a white person suffers in the hot months from any disease causing fever, e.g. enteric or sand-fly fever, etc., there is always a serious danger of hyperpyrexia, and this has to be guarded against.

**The Effects of Heat.**—The effects of exposure in the case of white races are not only manifested by the acute attack of heat-stroke, but, if this is avoided by proper care, it is nevertheless certain that long residence in the Persian Gulf causes a certain amount of tissue degeneration, owing to the exposure of the body cells to abnormal conditions of temperature. The highly specialized cells, viz. those of the nervous system, suffer most; and nerve-cell fatigue is shown by manifestations of neurasthenia. Lack of the power of brain concentration and severe inability to undergo the mental strain of arduous work are often the penalty which white races pay.

Beri-beri is a dietetic deficiency disease which manifests itself by cardiac weakness with shortness of breath, swelling of the legs and peripheral neuritis with numbness of the limbs and weakness. The climatic conditions of the Persian Gulf particularly seem to predispose to this disease, for it very frequently attacks white persons resident there, especially if they are exposed to dietetic hardships.

Residents in the towns along the Persian Gulf are exposed to the same dangers from disease as are experienced in similar places in Mesopotamia and Persia (see MESOPOTAMIA and PERSIA). Thus malaria and sand-fly fever, dysentery, typhoid and paratyphoid fever, cholera, smallpox, and occasionally typhus fever, eye diseases, oriental sores and indeed any disease conveyed by impure water, flies, contaminated dust or the contagion of sufferers from infectious diseases, are prevalent in the inhabited places along the Persian Gulf, and precautions must always be taken to guard against them.

(W. H. W.)

**Geology.**—Large portions of the littoral had not up to 1921 been examined geologically. Of the numerous islands that dot the Gulf many are partly at least of volcanic origin, notably Qishm and Ormuz.

The geological formations represented are the following in descending order:—

*Recent or sub-recent*

Shelly conglomerates and dead coral reefs of the littoral; red sandhills of the coast of Trucial Oman; alluvium of Turkish Iraq; river and lake deposits of Oman and the interior of Persia.

*Pleistocene  
Pliocene*

Foraminiferal oolite or "Miliolite." Bakhtiari series; grits and conglomerates.

*Miocene*

Fars series; marls, clays and sandstones with limestones and interbedded strata of rock gypsum.

*Lower Miocene*

Clypeaster beds of the Bakhtiari mountains.

*Oligocene and Eocene*

Nummulitic limestones of Persia; Muscat series; and Bahrein series. Ormuz series; lavas and tuffs with interbedded clays and sandstones.

*Upper Cretaceous or  
Lower Eocene*

*Upper Cretaceous*

Hippuritic limestones of Persia and Oman.

*Jurassic or Lower  
Cretaceous*

Serpentinous and other igneous rocks of Oman.

*Carboniferous to Trias*

Oman series; limestones and slates with beds of chert.

*Archaeozoan*

Hatat beds; schists and quartzites.

The latest movement to which the Gulf has been or is now being subjected is one of gradual elevation, of which traces are found in recent littoral concretions, now as much as 450 ft. above present level, and in the flat ledge which surrounds Muscat harbour.

Numerous "shows" of petroleum exist along a broad belt running N.W. and S.E. through Mesopotamia and down the Persian Gulf. These are the most abundant at the foot of a chain of hills where the oil wells of Daliki, Bebehan, Ramuz and Shushtar, Dizful, Pusht-i-Kuh, and Qasr-i-Shirin are situated. Oil has, however, been struck in paying quantities hitherto only at a point 30 m. E. of Shushtar. Experimental boring on Qishm I. in 1916 had not given any result up to 1921.

Among other mineral products, asphalt is found at Bahrein; coal 30 m. inland from Sur, and some seams of good coal in newer strata; sulphur occurs in a fairly pure state at Khamir and Bustaneh near Lingeh, and on Qishm I.; copper, as copper glance and malachite, occurs in the interior of Oman; copper-mines are said to have been worked in the neighbourhood of the coast near Lingeh by the Portuguese, but all trace of them has been lost. Red ochre, for which there is only a limited market, is mined on Ormuz, Abu Musa and other islands in the Gulf; salt, as deposits, on Ormuz and Qishm I., and by evaporation, near Mohammedrah, Fao and elsewhere on both sides of the Gulf; gypsum is widely distributed throughout the Gulf; iron, as haematite and pyrites, widely found through the Ormuz series.

**Earthquakes** are frequent and sometimes severe in the Persian Gulf proper, especially on Qishm I. and on the coast in the neighbourhood. In 1865 an earthquake levelled the villages of Darveh Asul near Mugam; in 1880 an earthquake caused 120 deaths in Basra; in 1883 severe shocks were felt from Bushire to Tahiri; in 1884 an earthquake caused 132 deaths on Qishm I., which was in consequence deserted; in 1897 an earthquake destroyed Qishm town and caused over 1,000 deaths; further shocks were experienced at Qishm and Bandar 'Abbas in 1902 and 1905.

**Agriculture.**—Cereals are produced in considerable quantities in the hinterlands of Mohammedrah and Bushire and in the intervening coastal strip; the rest of the Gulf largely depends on imports from this part of Persia or from India. Dates are grown for the European market at Muscat and for local consumption on both sides of the Gulf, but not in considerable quantities. The Muscat date reaches maturity sooner than the Basra crop, and is commercially valuable.

**Live Stock.**—Camels are abundant on the Arabian side of the Persian Gulf littoral and are also found on the Persian coast, especially where the country is open. Horses are scarce in Oman and few are kept in Trucial Oman or in Bahrein or El Hasa. But they are more common in Qatar and Kuwait. Nejd, or Central Arabia, is the principal horse-breeding country adjacent to the Persian Gulf, and is the only one in the world, except the adjacent Syrian desert, where the genuine Arab is produced on any considerable scale.

**Sailing Craft.**—The Persian Gulf is by tradition the home of sailing craft, for their skill in handling which the Phoenicians afterwards became famous in the Mediterranean. There are some 14 types of native craft which belong to the Persian Gulf proper. The same principle of construction applies to nearly all; as a general rule these vessels are remarkable for the beauty of their lines. They sail well and are weathery craft. The principal shipbuilding centres in the Persian Gulf are now Kuwait, Sur in Oman and Lingeh.

**Fisheries.**—Few seas are more prolific in fish than the Persian Gulf and the Gulf of Oman; the great proportion of known species are edible and many have a commercial value for the isinglass or oil.

extracted from them. Fish are extensively used for manure, especially in Muscat, where they are also fed to cattle without unpleasant results. Sharks are caught in enormous numbers with hook and harpoon; the flesh is considered by some to have aphrodisiacal properties; the dried fins and tails are exported to China; the oil is used for smearing boats. The turtle is also found, the carapace being exported as tortoiseshell, the animal being gently roasted or boiled alive over a slow fire to facilitate the separation of the shell from the flesh. The whale is often seen in the Gulf of Oman; porpoises and swordfishes are common.

**Pearling Industry.**—The pearling grounds of Bahrein are in over six fathoms of water, mostly beyond the three-mile limit. The geological formation of the bottom of the Persian Gulf and the temperature and shallowness of its waters appear to be favourable in a high degree to the growth of the pearl oyster. The pearl banks which are known and actually worked occupy a very considerable proportion of the whole area of the Gulf, chiefly upon the Arabian side. The pearl banks on the Persian side are found chiefly on the coast between Lingeh and Tahiri, and again in the neighbourhood of Kharag Island. The largest and most productive of all the banks are situated on the Arabian side of the Gulf and are fished annually; the banks of the Persian coast are poor as well as small and are fished at infrequent intervals. The total value of pearls exported was estimated in 1905 at about £1,500,000, the value at current prices of the 1919 outturn was probably about £2,500,000. Mother-of-pearl was exported before the World War to the value of £20,000; after the war high freights and absence of demand from Hamburg, the principal market, killed the trade for the time being. Some 4,500 boats employing some 75,000 men are employed in the pearling industry during the season, which lasts for almost three months, and can do little else but fish for the rest of the year.

**Commerce.**—A summary of import and export values of trade in the Persian Gulf, excluding Mohammerah and Basra, is appended. It is, however, not possible to make reliable deductions from these figures taken by themselves. The normal value, for example, of the post-war exports of Bahrein should be more nearly £3,000,000 than £1,000,000, owing to the enhanced value in terms of money of pearls, and the export trade of Bandar 'Abbas should likewise be more in a normal post-war than in a pre-war year. Of the total imports from 1912-3, one-half come direct from India and a quarter from the United Kingdom direct, the balance from foreign countries, European and Asiatic, in about equal proportions. For the latest post-war statistics up to 1921 the proportions were respectively two-thirds, one-sixth and one-sixth, owing primarily to the almost complete cessation of direct shipments from Europe to the Persian Gulf.

**Mail Communications.**—The Persian Gulf was at the end of the 18th century the most rapid route between Europe and India, and it was not until 1833 that the Red Sea route was adopted by the East India Co.; from this date until 1862 the Gulf fell into an extraordinary state of inaccessibility—letters for India being sent from Baghdad and Basra via Damascus, and correspondence from Bushire for Baghdad via Teheran. In 1862 the British India Steam Navigation Co. undertook their first mail contract for the Persian Gulf, and simultaneously the Euphrates-Tigris Steam Navigation Co. agreed to run a subsidized line of mail steamers from Basra to Baghdad.

The British India Co. maintain weekly and fortnightly services between Basra and the Persian Gulf. The fast weekly steamer stops only at Karachi, Bushire and Mohammerah on its way to Basra. The slow mail steamers stop at every port in the Gulf, either on the upward or the downward voyage.

**Posts.**—The reopening in 1862 of direct communications between India and the Persian Gulf gave rise to a demand for properly organized post-offices, and the Indian Postal Department accordingly opened branches in 1864 at Muscat and Bushire. Every port of importance on both sides of the Persian Gulf has an Indian post-office transacting all classes of business.

The existence of these offices on Persian soil has occasionally been the subject of complaint by the Persian Government. The justification for their continued existence has been found in the climatic conditions of the Gulf, which make it difficult for the Persian Government to staff their own offices adequately, and in the fact that the rupee is the only currency common to all ports of the Gulf and to India, while the trade of these ports is mainly with India.

**Telegraphs.**—The inception of the Persian Gulf telegraphs, which formed the first links in an intercontinental chain, was dictated not by local interests, but by broad considerations of national advantage. The Crimean War of 1856 brought home to the Porte the slowness of communication between the Persian Gulf and the outlying provinces of the Turkish Empire, while the Mutiny of 1857 taught the British Government a similar lesson in regard to India. In 1857, after some unfruitful preliminary attempts, the Turkish Government agreed to the construction of a line from Scutari to Baghdad on their behalf; this was finished in 1861 and was extended to Fao by 1864, after further lengthy negotiations, when it was linked up with the cable from Karachi which had been laid meanwhile. The route of the cables has been several times altered. They now run from Karachi to Jask, whence a cable runs to Muscat; from Jask one cable runs to Hanjam, and thence to Bushire; another cable runs direct to Bushire. Hanjam is connected by cable with Bandar 'Abbas. A double cable connects Bushire with Fao. Bushire, Hanjam, Bahrein, Abadan and Basra

Summary showing Import and Export Values of Trade in the Persian Gulf (excluding Iraq and Arabistan) in two pre-war years and in the latest post-war year available

	Imports			Exports			Total
	1912-3	1913-4	Post-War Year	1912-3	1913-4	Post-War Year	
<i>Arab Side</i>							
Kuwait	£438,298	£370,817	£1,061,300	£132,260	£114,421	£276,092	£1,337,392
Bahrein Is.	2,239,527	1,877,620	1,414,423	2,295,136	1,740,008	946,344	2,300,707

<i>Total</i>	£1,430,922	£1,464,887	£3,880,250	£1,114,928	£994,846	£1,297,458	£5,177,708
<i>Grand Total</i>	£4,572,298	£4,121,102	£6,645,937	£3,843,801	£3,120,811	£2,546,264	£9,408,019

\* 1918-9 in the case of Muscat, 1919-20 in other cases.

† Reckoning 55 Krans to the £.

**Banks.**—The Imperial Bank of Persia, in addition to branches all over Persia, has branches at Bushire, Bandar 'Abbas and Mohammerah. The Eastern Bank has a branch at Bahrein.

**Currency.**—Persian currency alone is legal in Persia, but the rupee is freely current in Persian ports. On the Arab coast the rupee is legal tender, and is almost exclusively used for commercial transactions, but the Maria Teresa dollar circulates freely, and is preferred by the inhabitants of the interior of Arabia. Persian currency is also in use, principally in Bahrein.

**Lights and Buys.**—In view of the difficulties attending navigation in the Gulf, and the impossibility of arranging with the Governments of the littoral for the provision of lights and buoys except on terms which would have greatly hampered shipping, the British Government, in view of the great preponderance of British shipping in the Gulf, has established since 1912 a very complete system of lights and buoys, the cost of which is shared in equal moieties by the Government of India and H.M. Government in accordance with the recommendations of the Welby Commission. Lighthouses exist on one of the Quwain group of islands off Ras Musandam and on Tunb I.; light-buoys have been placed at Bushire in the outer and inner anchorages, at Bahrein and on the Shatt al 'Arab bar. Shore lights and unlighted buoys have also been provided where necessary. There is a lightship in the Shatt al 'Arab bar, which is very completely buoyed and lighted throughout its length from the lightship to Fao, where there is a fixed light.

are provided with wireless stations. Kuwait is connected by land line with Basra; Jask is connected by a land line to Karachi. Mohammerah is connected by land line and cable with Basra and Abadan and via Ahwaz with Bushire and with the inland Persian system. Bushire has its own telephone system; Mohammerah is connected by telephone with Basra. The whole system is under the control of the Indo-European Telegraph Department, whose director-in-chief is responsible to the Secretary of State for India. The Department, which also controls the principal international lines in Persia, is amply self-supporting.

**Population and Religions.**—In all the countries of the Persian Gulf, Islam in one or another of its forms prevails, almost to the exclusion of other religions. The Mahomedans of the Persian Gulf region belong to the following denominations:—Sunni, Shiah, Ibadhi, Wahabi and Khojah. The Wahabis may be regarded as a branch of the Sunnis and the Khojahs as a branch of the Shiahs. Shiahs predominate on the Persian coast except in the districts of Rud Hilleh, Shikhub, Lingeh, Bastak, Biyaban, Jask, and on the islands of the Persian Gulf. The Persian province of S. Arabistan, which is under the hereditary government of the Sheikh of Mohammerah, is exclusively Shiah. The Sunnis are estimated at 100,000 out of a total population in the maritime districts of 300,000.

Persian Makran is exclusively Sunni except for the district of Jask. At Gwadar, Sunni, Khojah and Ibadhi rub shoulders. The Oman sultanate is predominately Ibadhi. In the territory controlled by the Emir of Nejd the official religion is Wahabi, but a few Shiah are still to be found in the districts of El Hasa and Hofuf. Bahrain is Sunni, but has a large Shiah population of Persian origin. Kuwait is Sunni, with Wahabi leanings.

The Khojahs number some 2,000 souls and are distributed over the ports of the Gulf, mainly on the Arab side. They are descended from Hindus of Sind and Kach, who were converted from Hinduism to the Isma'ili form of the Shiah faith in the 15th century of the Christian era.

Hindus total about 1,500 and are to be found in all the principal ports of the Gulf, especially at Gwadar, where their presence gives rise to occasional fanatical disturbances. Panislamic ideas have obtained little hold in this region; in Persia and wherever people are Shiahs the pretensions of the Sultan of Turkey to the headship of the Mahomedan world are rejected, as also in Oman, where the bulk of the population are Ibadhi.

*Missions.*—Roman Catholic missions have at intervals worked in the Persian Gulf, on the Persian side since the beginning of the 17th century; they are still represented at Bushire. The first Protestant mission to the Gulf was initiated by Henry Martyn in 1811; his Arabic New Testament appeared in 1816. The American Arabian mission was founded in 1889 in the United States; the first agents of the mission were the Rev. J. Cantine and the Rev. S. Zwemer, who established a branch at Bahrain in 1892 and later at Muscat. Political complications arising out of the work of the Arabian mission have been singularly few, a happy circumstance which must be attributed chiefly to the missionaries themselves, whose general opinion is that for a Mahomedan country the Persian Gulf and eastern Arabia are peculiarly free from religious fanaticism.

*Historical.*—The Persian Gulf has figured in history from the earliest times. A myth (preserved by Berosus) records that Oannes (Hea) the fish-god came up from that part of the Erythraean Sea which borders on Babylonia, to teach the inhabitants of that country letters and sciences and arts of every kind. This seems to indicate the arrival, in ships, of strangers of a higher grade of civilization. These strangers may have come from China, but Sir H. Rawlinson considers they were a dark race not belonging to the Semitic family. Rawlinson also suggests that the Phoenicians may have originally come from the Bahrain Is. and extended westwards to the settlements on the Mediterranean at least 5,000 years ago. Though there is no direct evidence of this connexion, enormous numbers of tumuli, probably of Phoenician origin, exist on the Bahrain Is., which also contain tumuli of Babylonian age. Babylonian tumuli have also been found at Bushire. Col. Yule, from Chinese annals of the 7th and 8th centuries, says that Chinese ships came as far as Siraf (Tahiri) and the Euphrates, where they lay at Hira near Kufa, and adds that this trade fell off in A.D. 878 owing to civil war in China. From the records of Fa-Hian of the 4th century it is clear that ships from China exchanged merchandise with Arab vessels at Ceylon, and this is confirmed by the account of Cosmas, who wrote between 530 and 550 A.D. Along the shores of the Persian Gulf in 326 A.D. came Nearchus, the admiral of Alexander, on his way from the Indies to the Tigris delta; from Basra sailed Sindbad in the 9th century in one of the many Arab craft which traded thence to India, Ceylon and Zanzibar. Thousands of years before Christ the pearls of Bahrain were sold in Egypt; Bahrain still supplies 80% of the world's output of pearls. After the Phoenicians, Babylonians, and Arabs came the Persians; though they never aspired to command of the seas and are indeed not a maritime race, the Persian Gulf was no obstacle to them, and at one time or another they occupied Muscat and parts of Oman and Bahrain, and penetrated into the greater part of Arabia.

Commerce between East and West had from early times followed this route in preference to that of the Red Sea, and when during the 15th century Genoa and Venice successively lost their positions in Oriental commerce, through the capture of Constantinople by the Turks and by the hostility of the Mamelukes of Egypt respectively, the country which most earnestly devoted itself to the quest of a new way to India was Portugal. Albuquerque seized several towns on the coast of Oman, including

Muscat in 1507, and soon afterwards established his authority on the I. of Ormuz, at the N. of the Gulf. Towards the end of the 16th century the Dutch made their appearance in Indian waters as rivals of the Portuguese; and in 1616 the first British "factories" of the East India Co. were established on the Persian coast. In 1622 the Portuguese were expelled from Ormuz by joint efforts of the British by sea and of the Persians by land; in 1650 they finally left Muscat. In 1664 the French made their appearance on the scene, but did little trade. It is, however, of interest to note that in 1698, in consequence of a nominal agreement, from which nothing resulted, among the principal Europeans in the East, the French undertook the policing of the Persian Gulf against pirates. The Dutch, who had played no part in expelling the Portuguese, now became increasingly predominant, and the wars that were waged in Europe between England and Holland had their counterpart in the Persian Gulf.

In 1674 hostility between Holland and England ceased, but the position was radically unsatisfactory owing to the prevalence of piracy, from which both England and other nations suffered heavily. At the beginning of the 18th century the improved state of affairs in India began to have an effect on the Company's branches in the Persian Gulf and by the middle of the 18th century the Dutch settlements had disappeared.

Henceforward the bulk of the trade was in British hands, but piracy was rife, the slave trade flourished, and the coast towns and islands of the Persian Gulf had fallen from their ancient prosperity to a lower level than they had experienced for some centuries. To restore this prosperity had for about a century before 1921 been the secular mission of Great Britain in these lands, the British resident in the Persian Gulf, acting as the representative of the Government of India, being the umpire to whom by long custom all parties on both coasts appealed and who had by treaties been entrusted with the duty of preserving peace.

Students of international politics are familiar with the claims of nations to a position of preference in certain regions, based upon historic, economic or geographical considerations. The claims of Great Britain to such a position in this region are unique. But beyond two brief occupations of the I. of Kharag, and the continuous possession of a few square miles of desert land at Basidu, the S.W. end of the I. of Qishm, she has at no time acquired territory in that region, although she has for generations borne an honourable burden there which no other nation has ever undertaken anywhere, except in the capacity of sovereign. British influence kept the peace amongst peoples who were not subjects of the King-Emperor; Great Britain lighted, buoyed, charted and patrolled for over a century waters over which it claimed no formal lordship; and kept in strange ports an open door, through which traders of every nation might have equally free access to distant markets. On the other hand, a steady and increasing market was gained for the products of the British Empire, and in particular for those of India; the ports of the Gulf were made safe, not so much for the British as for the Indian trader; nearly 75% of the trade of the Gulf ports was in 1921 with India, and an even greater proportion in the hands of Indians, Persians and Arabs. A good market had been created for Indian products, particularly yarns and cereals. But more than this, Great Britain had gained a reputation for patient and persevering efforts to promote the spread of civilization in these regions, a prestige which yielded profit during the difficult years of the World War, and was not without its effect in India. With the exception of local disturbances of old standing at Muscat, and at Bushire (where they were fomented by German gold), the Arab and Persian population of both shores maintained a friendly attitude to Great Britain throughout the war, although British gunboats were seldom, if ever, seen at that time in waters which in peace they had regularly patrolled.

The peculiar interests, strategic, political and commercial, of Great Britain in the Persian Gulf have never been denied; they are intimately connected with the welfare of India, with the security of its communication with the outside world, and of its internal tranquillity. The considered policy of the British Government was embodied in 1903 in Lord Lansdowne's declaration in the House of Lords that "we should regard the establishment of

a naval base or a fortified port in the Persian Gulf by any other Power as a very grave menace to British interests, and we should certainly resist it by all the means at our disposal." This declaration was formally reaffirmed in 1907 by Sir E. Grey, in a despatch to the British ambassador at St. Petersburg, which further stated that "H.M. Government will continue to direct all their efforts to the observance of the *status quo* in the Gulf, and the maintenance of British trade; in doing so they have no desire to exclude the legitimate trade of any other Power." These declarations were never openly challenged, and in 1912-4 the British Government entered into far-reaching negotiations with the Turkish and German Governments with the object of regularizing the position. The resulting agreements had not, however, been ratified before the declaration of war in 1914.

*The Arms Traffic.*—During the 3rd Afghan War the trade in modern arms and ammunition in the Persian Gulf attracted the attention of the British and Indian Governments for the first time. In 1880 the Government of India took preliminary steps in the matter within its own borders; in 1881 the importation of arms and ammunition into Persia was made illegal, but with little effect. In Far Eastern countries firearms are widely possessed and used. In 1890 the General Act of the Brussels Conference struck a blow at the arms trade in Africa and diverted it to the Persian Gulf, which was not subject to the Brussels Act.

The stream of arms flowing from Zanzibar to Muscat continued to increase in volume, and in 1892 no less than 11,500 firearms were landed at Muscat, of which more than half were at once reexported. The figure was doubled by 1895 and trebled in 1897; in spite of prohibitions, imports into Persia continued on a large scale. Moved at last by the great quantity of military material that was being found in the Gulf, the British Government urged the Persian Government to enforce the actual law and to confiscate the stores of arms which had accumulated at Bushire. The Persian Government, thoroughly alarmed, took action, but with only temporary effect. Somewhat similar action was taken at Bahrain. These seizures created much indignation and anxiety among firms in England whose interests were involved.

From 1898 to 1908 the attitude of the British Government towards the question was one of regular attention without the power to intervene directly or effectually. In 1900 the consignment of arms and ammunition to the Persian Gulf through Indian ports with or without transshipment was made illegal. This was reinforced by an Act of Parliament empowering the sovereign to prohibit by proclamation the export of arms and ammunition from the United Kingdom to countries or places where they might be employed against British troops and subjects.

The trade, blocked at Persian ports and later at all Gulf ports except Muscat, continued to flourish, in spite of a naval blockade of the Makran coast by Great Britain in 1910-1. At length, however, in 1912 the Sultan of Muscat issued a proclamation requiring all arms imported into Muscat to be placed in a special warehouse from which they could not be removed except on production of an import permit from the competent authority at their destination. This killed the trade at Muscat; the French Government, who had claimed that the Sultan's proclamation was inconsistent with his treaty engagements with them, accepted the accomplished fact with good grace after lengthy diplomatic negotiations, and the trade was by 1913 almost dead, except at the N. end of the Gulf, where it still flourished on a small scale. The arms traffic has been responsible for much of the prevailing anarchy of the Middle East and indeed of Arabia. The possession of firearms places irresistible temptations in the path of unsophisticated and quick-tempered tribesmen. For this result the European Powers signatories of the Brussels Act of 1892 are to blame for lack of foresight and to some extent of goodwill. Joint Anglo-French action at any time during 1902-12 would probably have been effective in stopping the traffic.

*Slave Trade.*—On board the fleet which in 1626 conveyed Sir Dodmore Cotton, a British ambassador, with his staff, from Surat to Bandar Abbas, there were more than 300 slaves bought of Persians in India, and the only remark which this circumstance suggested to Sir T. Herbert was that "ships, be-

sides the transporting of richer varieties from place to place, consociate the most remote regions of the earth by participation of commodities and other excellencies to each other." In 1772 it was decided by the English courts that a slave as soon as he set foot on the soil of the British Isles became free; the slave trade, however, continued actively until 1807, when an Act was passed to prevent British subjects dealing in slaves; in 1811 the traffic in slaves was declared to be felony; in 1833 the status of slavery was abolished throughout the British Dominions. In defiance of her commercial interests and of her popularity with the Moslem population of the Gulf, Great Britain set herself to suppress the trade, and executed a series of agreements with the chiefs of the Arabian littoral with this object. The arduous task of enforcing the observance of these treaties fell upon the Government of India and involved great sacrifice of lives and money.

In subsequent years over 700 slaves were rescued at sea and more than 2,000 otherwise released; the traffic was by 1920 virtually dead in the Gulf, but slavery as an institution seemed likely to continue for many decades to come to flourish inland in Muscat, in Central Arabia, and in a modified form in part of Persia.

*AUTHORITIES.*—The chief source of information is the late J. G. Lorimer's *Gazetteer of the Persian Gulf*, published confidentially by the Government of India in 1908. See also Lord Curzon's *Persia* (1892); papers by T. J. Bennett, of *The Times of India* (Royal Society of Arts, 1902), and the late Comm. A. W. Stiffe, *Indian Navy* (*Jour. R.G.S.* 1897); and handbooks prepared during the war of 1914-8 under the direction of the Historical Section of the Foreign Office. (A. T. W.)

**PERTAB (or PARTAB) SINGH, Sir** (1844- ), Indian soldier and statesman (see 21.250), relinquished his position as Maharaja of Idar in 1911 in favour of his adopted son Daolat Singh, in order to resume the regency of Jodhpur which he had previously held on the death of his brother in 1895, but this time for his grand-nephew Summair Singh, then 13 years of age. When the World War broke out Sir Pertab, in the words of Lord Hardinge the Viceroy, "would not be denied his right to serve the King-Emperor in spite of his 70 years." He came to France for service in the field with his young ward, then only 16, and commanded the famous Jodhpur Lancers. In the later stages of the war he served with them in Egypt and Palestine. Sir Summair Singh died in 1918, two years after receiving ruling powers, and Sir Pertab again became regent, assisted by a council.

**PERU** (see 21.264).—No accurate statistics for the pop. of Peru exist, but probably there are between 3,500,000 and 4,000,000 inhabitants besides the savage tribes, still partly independent, who inhabit the remoter *montaña* or eastern forest region. The racial proportions are approximately:—

Negroes, pure-blooded or predominantly African	6%
Various (including Asiatics, African-Indian mixture, etc.)	10%
Indians, pure-blooded or nearly so	52%
Mestizos (mixed Indian and white blood)	30%
Whites (entirely of Caucasian blood)	2%

The negroes are either descendants of slaves of colonial times or, in fewer cases, people who have drifted in during recent years from the Barbados, Trinidad, Panama, etc. Though the negroes of colonial times were notorious for their brawls and riots, those of to-day seem to be reasonably law-abiding. They are addicted to many vicious practices which are gradually causing the population of Lima and other coast cities to decrease in physical strength and intelligence. Most of the negroes live on the coast. The Indians fall into two groups: those who dwell in the highlands or *sierra* in the interior and still preserve their ancient language and customs, and those who live on the coast and speak Spanish, dressing more or less after the European fashion and observing but few customs that can be called pre-Spanish. The lot of the highland Indians is, in many districts, very bad. This is due to three chief causes: the abuse meted out by the great landed proprietors ever since the conquest (1531) and continued with some abatement to the present day; the use of far too much alcohol and coca; the lack of even rudiments of public or personal hygiene. There is much evidence, however, that the lot of the Indians will improve within a generation or two. The younger generation of the land-holding class are beginning to see that it will be to their advantage to improve the material and social condition of the Indians on their estates; there is an increasing agitation in favour of suppressing the sale of sugar-brandy and other harmful liquors to the Indians and of regulating the consumption of coca; at the present time the Peruvian Government is beginning to take serious measures for the sanitation of the country. The *mestizos* compose the middle class, the artisans, small shopkeepers, clerks,

petty politicians, etc. They tend to congregate in the cities. They are mostly unintelligent, though a small percentage of them enjoy an improved social status, won usually by the exercise of an intellectual calling, the law, medicine or literature. The *whites*, though few in number, were, until the revolution of July 1910, the dominant class in Peru. They owned most of the land and controlled all the more important political posts. For the most part they are thoroughly modern-minded and progressive people, intellectual and agreeable. It is to be regretted that few of the older generation recognized their responsibilities with regard to their Indian tenantry, but the younger men, according to observations in 1921, were beginning to take an interest in sociological problems.

Since 1890 all the Government railways then in existence, and additions to them made later, have been administered by the Peruvian Corporation, chiefly owned by foreign investors, which took over the railways and a number of other national resources. In 1920 the railways administered by the Peruvian Corporation were the following:—

	Length (miles)	Gauge (meters)
Central railway	248	1'44
Pisco to Ica railway	46	1'44
Southern railway	535	1'44
Pacasmayo railway	82	1'44
Paita to Piura railway	60	1'44
Chimbote railway	35	-9I
Trujillo railway	64	-9I
North-western railway	132	-9I
Lima-Lurin railway	22	-9I

Besides these important lines there are a number of others neither owned by the Government nor administered by the Peruvian Corporation. Chief of these are the Cerro de Pasco railway from Oroya to Cerro de Pasco and a few local lines in various coast valleys.

In the 10 years, 1910-20, a certain amount of road-building was done. In many parts of the coast comparatively little has to be done to make the surface of the desert a good road-bed for motor traffic. During the rubber boom of the previous decade there was a considerable development, in the forest region, of river traffic. But since 1910 that has slowly been diminishing, and in 1920 the Peruvian reaches of the Amazon were served by but one steamer which made one round trip per month.

Coastwise traffic by steamers is well organized and efficient. Two companies, one British and the other American, maintain direct sailings from New York to Callao, through the Panama Canal, the run being made in 12 days. There is also good direct service with England, the Mediterranean and Japan. The smaller ports of the Peruvian coast are served by the steamers of the Peruvian line, the Chilean line, the British line and a number of less important steamers. A direct service for freight only was in Feb. 1921 about to be inaugurated between the Peruvian coast and California. The telegraphs, wireless included, were in 1921 owned and administered by the Government. Experiments were then being made with the wireless telephone, also under Government. Two privately owned cable companies give coast and foreign service.

**Industries and Commerce.**—The chief exports of Peru are sugar, cotton and copper. There should be many other articles. Petroleum is already produced in considerable quantities, but Peru could attain a production of vegetable oil fully as important. Castor oil, linseed oil, cottonseed oil and rapeseed oil are a few of the possibilities. Meats, hides and wool could easily be exported on a large scale. Lumber, in the lower or easterly parts of the country, might well be made to take the place of the lost rubber trade. Peru suffers from the unimaginative ultra-conservatism of her landowning class and of her business men. The fundamental need is capital, and the only people in the country who have sufficient initiative to undertake these developments lack capital. Vanadium mining has been undertaken with unusual energy, and it is said that Peru to-day produces 95% of the world's vanadium.

Imports and Exports.  
(In Peruvian pounds, equal to £ sterling.)

	Imports	Exports	Excess of Exports
1910	4,980,697	7,974,076	2,993,379
1911	5,438,245	7,422,027	1,983,782
1912	5,140,338	9,438,581	4,298,243
1913	6,088,776	9,137,780	3,049,003
1914	4,827,930	8,767,790	3,939,860
1915	3,095,544	11,521,807	8,426,263
1916	8,683,150	16,541,063	7,857,913
1917	13,502,851	18,643,414	5,140,563
1918	9,705,113	19,972,595	10,267,482

The effect of the World War upon Peruvian trade, with Great Britain and the United States is displayed by the following table (in Peruvian pounds equal to £ sterling):—

	Imports from G.B.	Imports from U.S.	Exports to G.B.	Exports to U.S.
1912	1,367,976	1,248,880	3,237,564	3,599,851
1913	1,598,605	1,755,251	3,403,109	3,033,259
1914	1,338,552	1,579,723	3,274,097	3,046,892
1915	662,546	1,488,264	3,621,624	6,390,282
1916	1,496,304	5,116,582	2,961,841	10,404,334
1917	1,934,665	8,792,710	3,792,750	10,942,407

**Government.**—The Government of Peru is one of the most highly centralized in the world. Every question has to be decided in Lima, by the supreme Government, and often by the president in person. Directly or indirectly the president appoints all the prefects, sub-prefects and governors who administer the provincial subdivisions of the country. All of these officers are removable at his will. The Legislature (Chamber of Deputies and Senate) controls the purse-strings of the nation and acts as a check on executive extravaganzas.

From 1860 to 1919 the supreme law of the land was the Constitution of 1860. That constitution embodied all the leading principles of the extreme centralization already referred to. There was, however, a pronounced movement toward "regionalism" in the southern departments between 1910 and 1919. That movement aimed not only at liberalizing the administrative machinery, but also at a systematic improvement of the condition of the Indians.

In Jan. 1920 President Leguia's Government brought into being the Constitution of 1919, prepared chiefly by Senator Mariano H. Cornejo and Don Germán Leguia y Martínez. That constitution makes concessions to the demand for regionalism by creating "Regional Congresses," three in number, one for the north, one for the centre and one for the south.

**History.**—From 1908 to 1912 was the first term of Augusto B. Leguia y Salcedo as president of Peru. A number of internal reforms and improvements were planned by him, but the collapse of the rubber market caused great financial stringency and had the indirect result of curtailing the Government's reforming activities. It was during this first term of Leguia that the Yale Peruvian expedition, headed by Prof. Hiram Bingham of Yale, conducted extensive geographical and archaeological explorations in Peru. The results were published and did much to direct the attention of foreign capitalists and others to Peru. Other Yale expeditions continued their work in Peru until 1915 when, as a result of misunderstandings, Prof. Bingham and his followers were ordered out of the country. Between 1912 and 1915 Guillermo Billinghurst and Oscar Benavides were presidents, each for a short term of revolutionary character. During this period there were diplomatic conflicts between Peru and Bolivia and Peru and Ecuador, neither of them going so far as to become military in character.

The outbreak of the World War in Aug. 1914 found Peru in an exceedingly bad state financially and economically. Until well into 1915 financial depression of the most acute kind continued. But about the middle of 1915 a great demand for Peruvian cotton, sugar, copper and other products came into being, with the result that exportations, at war prices, attained proportions never known before.

From July 1915 to July 1919 José Pardo y Barreda was President. In his time came the question which side was to be favoured by Peru in the World War. The then ruling class was inclined, at first, to be pro-German, partly because they were not fond of England (due to conflicts with the Peruvian Corporation), partly because they did not like the "democratic" atmosphere of President Wilson's various documents, and also partly because they had personal, financial and sentimental ties with Germany. On the other hand, many members of that class and the mass of the thinking element of Peru as a whole were strongly in favour of the Allies. Consequently, soon after the declaration of war by the United States in 1917, the Government of Peru severed diplomatic relations with Germany.

On July 4 1919 Don Augusto B. Leguia, who had been elected president to succeed Don José Pardo y Barreda (president 1915-9), seized the person of President Pardo by means of a re-

voluntary movement and himself became provisional President, being again duly re-elected to the presidency some time after. This movement caused profound consternation in Peru, where people were beginning to assure themselves that the day of revolutions was over. Leguía inaugurated an ambitious scheme of internal reform, including the sanitation of 31 Peruvian cities, the reorganization of the army by a French Military Commission, the reorganization of the navy by an American Naval Commission, the reconstruction of the educational system by American experts, and huge irrigation works built under the direction of an American engineer, C. W. Sutton.

The most important reforms brought about by the Government of President Leguía were those calculated to modernize the country. President Pardo had inaugurated the practice of calling in foreign expert advice by inviting to Peru Dr. Henry Hanson, of the department of public health of the Panama Canal zone. Dr. Hanson was first invited to study the malarial fevers in the vicinity of Lima, but in July 1919 a serious yellow-fever epidemic broke out in Piura, the northernmost coast department of Peru, and he was sent thither with full authority to stamp it out. He continued in Peru as director of sanitation, and his work was much widened so as to include the general sanitation of Callao and the stamping-out of a bad epidemic of yellow fever which broke out in the department of Lambayeque in Jan. 1921. The late Gen. William Gorgas was also invited to Peru in 1919 in order to supervise extensive projected improvements to be carried out by the Foundation Company of New York. Those improvements were to include the resewering of Lima, the repaving of many chief streets of Lima and the sanitation of 31 Peruvian cities. There was much opposition to the contract made between the Peruvian Government and the Foundation Company—Congress, for example, being largely of the opinion that the contract was derogatory to the dignity and probity of Peru. This, together with the death of Gen. Gorgas, practically nullified the projected improvements.

A French Military Aviation Commission, headed by Gen. Vassal, came to Peru soon after President Leguía assumed office. It was intended to instruct officers of the Peruvian army in the use of various types of aeroplanes, and a school was founded at Maranga, near Lima. Proper financial support was not forthcoming, however, and in the middle of Feb. 1921 the French mission resigned, complaining that the situation in which they found themselves was intolerable. An American Naval Commission, headed by Capt. Frank B. Freyer, U.S.N., was called to Peru in July 1920 for the purpose of reorganizing the sea forces of Peru. In Jan. 1921 Capt. Freyer was made chief of staff with powers practically equal to those of the minister of marine.

Educational improvements under the general supervision of the minister of justice and instruction were undertaken. A large number of American educational experts, under the leadership of Dr. H. Erwin Bard, went to Peru, and Dr. Bard was made director-general of instruction (1921). The National Museum of Archaeology, likewise dependent upon the minister of justice and instruction, was also placed under an American expert from the Smithsonian Institution. (P. A. ME.)

**PÉTAÏN, HENRI PHILIPPE BENONI OMER JOSEPH** (1856–), French soldier, was born on May 24 1856. He was commissioned from St. Cyr 1878, passed in due course through the Ecole de Guerre, filled various staff appointments, including that of instructor at the Ecole de Guerre, and was promoted colonel in 1910. At the outbreak of the World War he was commanding an infantry regiment, but he was immediately given a brigade and then a division, and he acquitted himself so well during the opening weeks of the struggle that he was advanced to the command of an army corps in Artois in Oct. 1914. He greatly distinguished himself on the occasion of the French offensive near Arras in May 1915, where his corps completely broke through the German position, though exploitation proved to be impossible for want of reserves. Soon afterwards he was given command of the II. Army. When preparations were being made in the summer for the contemplated offensive

in Champagne, he was called upon to aid Gen. Castelnau in framing the plans and in carrying them out. Then, when the Germans in the following Feb. were gaining ground very rapidly before Verdun and the safety of the place of arms hung in the balance, Castelnau was sent to stabilize the defence. A few days later, having provided for the indispensable, Castelnau handed over control of affairs to Pétaïn, who took the battle in hand with method and energy, fought the attack to a standstill and saved Verdun. He was rewarded by being made a Grand Officer of the Legion of Honour and was placed in command of the group of armies of the Centre.

During the following winter Gen. Nivelle succeeded Gen. Joffre as commander-in-chief. Pétaïn's group of armies was not embraced in Nivelle's offensive scheme, but it was known that he was thoroughly doubtful of its success, and after its failure Pétaïn was appointed, first on April 27 chief of the general staff of the army, and then on May 15 commander-in-chief of the French armies on the western front. This position he took up at a moment when his troops were discouraged and mutinies were breaking out owing to severe losses, disillusionment following on over-sanguine hopes, and war-weariness, when the effects of the Russian revolution and those of America's intervention were alike difficult to discern, and when his own country was losing heart. He saw clearly that, in view of the wastage in man-power caused by three years of devastating war, an offensive project on a great scale, such as his predecessor had adventured, was impossible for the time being, and he therefore resolved first to nurse back the army to a healthy state of *moral* and then to restore its offensive powers by one or two battles with limited objectives in which victory was made certain by careful and abundant preparations. It was in accordance with this policy that he fought the Aug. battle at Verdun and that of Oct. on the Chemin des Dames, for which he was given the Grand Cross of the Legion of Honour. He established and maintained a close understanding with Sir D. Haig, and when the British V. Army was virtually rolled up near St. Quentin in March 1918, his promptitude in despatching reinforcements to the point of danger did much to relieve the critical situation. After Foch became generalissimo, portions of Pétaïn's forces played the leading part in the decisive counter-stroke near Soissons which first turned the scale, and during the subsequent victorious operations of the Allies, the French commander-in-chief was most successful in coördinating the advance of his forces at all points along a very extended front, maintaining his liaison with the British on the one flank and the Americans on the other, and in the case of the latter taking an active part in the preparation of their two offensives. He was created marshal of France on the conclusion of hostilities, in recognition of his brilliant services during the war, and he was the recipient of many high honours from the Allied Governments. He subsequently held the position of vice-president of the Conseil Supérieur de la Guerre.

**PETERS, KARL** (1856–1918), German traveller (see 21.300). In 1907–8 Peters, who had again taken up residence in Germany brought actions for libel against a Munich journal and the *Cologne Gazette*, seeking to clear his character in regard to his administration in E. Africa. These actions wrought no change in public opinion in Germany and Peters remained on the retired list. However, in April 1914, at the instance of the Imperial Colonial Office he was granted a pension. During the World War he supported the extreme pan-German programme. In Feb. 1918 he published an autobiography, and he died at Wolter, Brunswick, on Sept. 10 of the same year. He had lived to see German E. Africa, which he founded, conquered by British and Belgian troops.

**PETERSON, SIR WILLIAM** (1856–1921), British educationalist, was born at Edinburgh May 29 1856, the son of John Peterson, a merchant. He was educated at Edinburgh high school and University, and after being for a short time at Göttingen, in 1876 obtained the Ferguson classical scholarship and entered Corpus Christi College, Oxford. On leaving Oxford he was at first an assistant master at Harrow, but in 1879 became assistant pro-

fessor of classics at Edinburgh. In 1882 he was made first principal of the newly founded University College at Dundee, but in 1895 he was appointed principal and professor of classics at McGill University, Canada. During his 24 years' tenure of this important position the university greatly progressed, and the scientific faculties in particular advanced considerably. In 1915 he was made K.C.M.G. In 1919 he was incapacitated by a stroke, and resigned his position, and being taken to England died at Hampstead Jan. 4 1921.

Sir William Peterson was for some years chairman of the Carnegie foundation for the advancement of teaching in America. His published works include editions of Quintilian's *Institutes of Oratory* (1891); the *Dialogue on Orators* of Tacitus (1893 and 1914); the *Speech of Cicero for Caelius* (1895 and 1899); the *Cluni MS. of Cicero* (1901) and Cicero's *Verrine Orations* (1907); *Besti Canadian Essays and Addresses* (1915).

**PETROLEUM** (see 21.316\*).—Under the stimulus of increased consumption and many new uses for petroleum products, the search for petroleum both in the older producing countries and in new territories, often remote from civilization, was rewarded by important extensions and discoveries and, in many instances, by subsequent development, with the result that between the years 1908 and 1920 the world's petroleum production more than doubled. The increase is shown in the following table from the U.S. Geological Survey:—

World's Production.

Barrels of 42 U.S. Gal.				
1908	285,552,746	1915	427,740,129	
1909	298,616,405	1916	459,411,737	
1910	327,937,629	1917	508,687,302	
1911	344,174,355	1918	514,729,354	
1912	352,446,598	1919	544,885,000	
1913	383,547,399	1920	694,854,000	
1914	403,745,652			

In the period 1908-21 many prolific fields in the United States were developed, enabling that country to keep its preëminent position; Mexico grew from unimportance to second position; Argentina, Venezuela, Trinidad, Egypt and Persia developed production of commercial importance; Russia added the Maikop and Ural-Caspian fields, and Japan the Akita prefecture. In 1920 the United States produced 63.8% of the world's output, and up to the end of that year had produced 62.1% of the world's total commercial yield. The rank of the various petroleum-producing countries is shown in the table given below:—

United States Geological Survey—World Production of Petroleum.

Country	Production, 1920				Date of First Production	Total production, 1857-1920			
	Barrels of 42 U.S. gal.	Metric tons	Cubic meters	Per cent of total by volume		Barrels of 42 U.S. gal.	Metric tons	Cubic meters	Per cent of total by volume
United States	443,402,000	62,188,000	70,492,000	63.8	1859	5,429,693,000	729,640,000	863,213,000	62.1
Mexico	163,540,000	24,410,000	26,000,000	23.5	1901	536,524,000	80,047,000	95,287,000	6.1
Russia	25,429,600	3,471,130	4,042,800	3.6	1863	1,904,021,000	252,072,000	302,701,000	21.8
Dutch East Indies	17,529,210	2,365,347	2,786,840	2.5	1893	219,584,000	29,690,000	34,910,000	2.5
Persia	12,352,655	1,685,219	1,963,825	1.8	1908	48,070,000	6,558,000	7,642,000	1.5
India	7,500,000	1,000,000	1,192,000	1.1	1889	122,583,000	16,343,000	19,488,000	1.4

## NORTH AMERICA

**United States.**—Petroleum production in the United States in 1920 totalled 443,402,000 barrels. The following table from the U.S. Geological Survey gives the production of the important divisions in 1920 and in 1908, stated in bar. of 42 U.S. gallons:—

	1920	1908
Appalachian	30,511,000	24,945,517
California	105,668,000	44,854,737
Lima-Indiana	3,059,000	10,032,305
Rocky Mountain	17,517,000	397,428
Illinois	10,772,000	33,686,238
Mid-Continent	249,074,000	48,823,747
Gulf	26,801,000	15,772,137
Others	—	15,246
Total	443,402,000	178,527,355

The Appalachian area extends across the Appalachian Plateaus from south-western New York to Tennessee. It includes Kentucky, W. Virginia, Pennsylvania, New York and eastern Ohio. Oil and gas sands occur throughout a long stratigraphic interval, including rocks ranging in age from Ordovician to Carboniferous. Petroleum from the Appalachian area is a high-grade paraffin oil, the average gravity being about 45° Baumé (0.8,000 sp.gr.). The average for Kentucky is not quite so high. The Appalachian district is the oldest oil-producing area in the United States (see 21.317), and while a gradual decrease in its production from 1912 was shown, high prices and great demand resulted in substantial increases in 1919 and 1920. That the rate of decline was so slow is due to the remarkable thrift of small producers who have found it profitable to operate leases where production is one-sixth of a barrel a day and sometimes even less. A factor which has tended to revive and increase production in certain Pennsylvania districts is the so-called "water drive," by which water pressure is put on the rock to supplement the exhausted gas pressure. An instance of the result of the water drive is shown by figures of an eastern pipeline attached to nearly 18,000 wells in the Bradford and Allegheny pools; this line in 1909 ran 1,531,000 bar.; in 1913 1,267,000 bar., a decrease of over 17%; and in 1920 the amount had risen again to about 1,568,000 bar., showing an increase in eight years of 23.8 per cent.

The Lima-Indiana field covers north-western Ohio and north-eastern Indiana, the oil being obtained from lenses or discontinuous layers in Trenton limestone. The average gravity is about 39° Baumé (0.8,285 sp.gr.), although some of the oil is much heavier. The Lima-Indiana field is steadily declining.

The principal productive area in the Illinois field is in the south-eastern part of the state, but there are also small scattered pools in central and western Illinois. Most of the oil is obtained from beds of sandstone in the Pennsylvania and Mississippian series of the Carboniferous system. In gravity the oils range from 27° to 37° Baumé (0.8,917 to 0.8,383 sp.gr.). This field is also declining.

In the period between 1908 and 1921 the greatest increases in production in the United States occurred in the mid-continent field, embracing Oklahoma, Kansas, northern and central Texas, northern Louisiana and southern Arkansas. In 1920 the mid-continent field

accounted for 249,074,000 bar., or 56-2% of the total U. S. production. Pools are scattered throughout the area and new pools are constantly being discovered. Most of the oil produced in Kansas, Oklahoma and northern Texas is obtained from beds of sandstone in formations of the Pennsylvanian series (Upper Carboniferous). The oil produced in southern Oklahoma is mainly from several pools in beds of sandstone of the Pennsylvanian series, though some oil is found in the "red beds" of the Permian series (lower Carboniferous). The oil found in northern Louisiana and central Texas is obtained from sandstone or other porous rocks of the Cretaceous and Tertiary systems. The average oil from the mid-continent field is of about 35° Baumé (0-8,485 sp.gr.), ranging from the thick black oil of some of the Louisiana fields, which has a gravity of 21° Baumé (0-9,272 sp.gr.), to the high-grade Cushing oil of above 55° Baumé (0-7,568 sp.gr.). The Glenn pool discovery in Creek county, Okla., in 1907 led to a great petroleum development in that state. This pool reached a maximum production of 125,000 bar. a day, sustained from Aug. 1907 to Feb. 1908. In 1912 the famous Cushing pool, also in Creek county, was discovered. In the latter part of 1913 a well in the Cushing pool was drilled to the Bartlesville sand at 2,600 ft., and resulted in a large gusher and the inauguration of an unprecedented drilling campaign. The oil was the highest-grade crude yet discovered W. of the Appalachian fields. Gusher wells were brought in with frequency, and the production of the pool, which at the end of 1913 averaged about 25,000 bar. a day, was averaging at the end of 1914 over 225,000 barrels. There was a temporary decline early in 1915, but in April production had increased to almost 300,000 barrels. Subsequently it reached a maximum of 320,000 bar., sustained for a 60-day period. The Cushing production was of such high grade and so large that it broke the oil market. In June 1915 the flush production of the field had been exhausted and a decline began. Cushing in 1915 yielded 17% of the total quantity of oil marketed in the United States. The Cushing pool early in 1921 was producing about 27,000 bar. a day.

In 1914 the rich Augusta pool in Butler county, Kan., was opened up, and in 1915 the El Dorado pool, also in Butler county, was discovered. In 1916-7 the Towanda extension of the El Dorado pool resulted in the district increasing its output from an average of between 15,000 and 20,000 bar. in the first five months of 1917, to 80,000 bar. in June and to nearly 100,000 bar. for a few days in September. The wells in the Towanda extension were of large capacity but proved to be short-lived, and the El Dorado-Towanda pool declined to about 50,000 bar. before the end of the year. The pool early in 1921 was producing about 29,000 bar. a day.

Late in 1917 the discovery of oil in a well 3,450 ft. deep, a mile and a half S. of the town of Ranger in central Texas, stimulated a most sensational development, covering possibly the widest "boom" area in the history of petroleum in the United States. This was generally termed a "deep sand" development, and opened up extensive pools in Eastland county, Stephens county and a portion of Comanche county in 1918. Oil in the deep sand pools is obtained from several different horizons in the so-called Bend series, which is of Pennsylvanian and Mississippian age. In July 1918 a prolific well was drilled in at 1,735 ft. in the Burkburnett field in Wichita county, northern Texas, and Burkburnett was the scene of another great oil boom. The Ranger field reached a maximum capacity of about 75,000 bar. a day in the middle of 1919, but declined thereafter. It was producing 57,000 bar. on Jan. 1 1920 and 14,000 bar. on Dec. 31 1920. The Stephens county pool (where development was slower) was producing about 37,000 bar. daily at the beginning of 1920 and had increased its production to close to 130,000 bar. at the end of that year, subsequently declining to about 90,000 bar. in May 1921. The Burkburnett pool, following the opening up of the Burkburnett extension, reached a maximum yield of over 100,000 bar. daily in 1919, from which peak it gradually declined in 1920. Early in 1921 it was producing about 60,000 bar. daily.

Another important development in the mid-continent field was the discovery in Sept. 1918 of oil in a shallow well near Homer, Claiborne parish, in northern Louisiana. A large gusher at greater depth was brought in in Aug. 1919, and the boom scenes of Ranger and Burkburnett were transferred to Shreveport, La. (the headquarters of the Claiborne parish development), where late in 1919 and early in 1920 other large wells yielding as high as 30,000 bar. daily were brought in in the Homer pool. From a production of about 25,000 bar. at the beginning of 1920 the Homer pool reached a production of over 100,000 bar. in a few months. This output declined rapidly because of the quick decrease in production of the larger wells, but an average output of about 50,000 bar. daily was maintained during the latter part of 1920 and the early months of 1921. Geologically the northern Louisiana producing area is in what is known as the Sabine uplift, an uplift of considerable magnitude in the Coastal Plain sediments, the nature and age of which have not been definitely determined. One of the most important developments of the early part of 1921 was the discovery of oil in commercial quantity in southern Arkansas. The discovery well was brought in near El Dorado in Union county, and rapid drilling of subsequent wells increased the potential production of the new pool to between 40,000 and 60,000 bar. a day by April 1921.

Several important pools were opened up in the Gulf coast field, which first came into prominence in 1901 when the Spindletop pool

in Jefferson county, Texas, was developed. The Gulf coast field includes southern Texas and southern Louisiana, and the petroleum is associated with masses of rock salt and gypsum in domes. The age of the oil-bearing strata ranges from Cretaceous to Quaternary. The field includes a great number of small scattered pools, some of which have developed wells of enormous productivity. The gravity of the oil ranges from 15° to 30° Baumé (0-9,655 to 0-8,750 sp.gr.), an average of about 22° Baumé (0-9,211 sp.gr.). Among the more important pools of the Gulf coast are the Goose Creek, Hull, Humble, W. Columbia and Damon Mound pools. West Columbia attracted attention in 1920 when on July 20 the pool was extended by a well flowing at the rate of 26,000 bar. daily. This flow was practically sustained until Aug. 28, when the well rapidly declined.

The Rocky Mountain field, which embraces the areas of production in Colorado, Wyoming and Montana, as well as prospective production in Utah and New Mexico, was stimulated by the drilling in of a large well in the Salt Creek pool, Natrona county, Wyo., in April 1912. This started a general boom in Wyoming, which state supplies the bulk of the Rocky Mountain production. Petroleum in the Rocky Mountain field is obtained from strata of the Carboniferous and Cretaceous age. Oils from older strata range in gravity from 18° to 24° Baumé (0-9,459 to 0-8,865 sp.gr.) and are of paraffin base. The development of the richest part of the Wyoming fields was restricted until 1920, pending passage of legislation and issuance of regulations with respect to Federal public lands. The Wyoming field includes a large number of small pools, and the greatest production is obtained from the Salt Creek pool, which early in 1921 was producing about 50,000 bar. daily.

The California field, one of the most prolific in the United States, is divided into two geographic groups, one occupying two sides of San Joaquin Valley and commonly known as the valley fields, and the other occupying a large area along the coast and commonly known as the coastal field. All the valley fields, except one, lie on the west side of San Joaquin Valley, and the oil in most of them is obtained from porous Tertiary sandstone. The conditions in the coastal fields are in many respects similar. A very small part of the oil produced in California is obtained from Cretaceous formations. The oils range in gravity from 9-09° to 54° Baumé (1-000 to 0-7,609 sp.gr.), and heavy oils, containing little sulphur, predominate. A fair average gravity is about 21° Baumé (0-9,272 sp.gr.). California for many years was the leading oil-producing state. It was supplanted by Oklahoma in 1907 and 1908 but regained first place in 1909. California held this position until 1915 when its production declined, while Oklahoma's output, because of the Cushing production, greatly increased, Oklahoma again taking first place. Oklahoma held first place through 1920 with California a close second. The principal producing districts of California are: the Kern River, McKittrick, Midway-Sunset, Lost Hills and Belridge districts, all in Kern county; the Coalinga field, in Fresno county; the Compo and Santa Maria fields in Santa Barbara county; the Ventura and Newhall fields in Ventura county; and the Los Angeles and Salt Lake and Whittier-Fullerton fields in Los Angeles county. The largest production is obtained from the Midway-Sunset field, which in 1920 produced 37,917,010 bar., a daily average of 103,598 barrels. The Los Angeles and Salt Lake field produced 28,694,163 bar., a daily average of 78,399 bar.; the Coalinga field 15,464,198 bar., a daily average of 42,252 barrels. Important addition to production in the Midway-Sunset field was made in 1920 and 1921 by the development of the Elk Hills district, where large wells ranging from 2,000 to 6,000 bar. were brought in. Production of this district increased from 25,000 bar. per month during Dec. 1919 to 1,500,000 bar. during Dec. 1920.

Oil shale deposits are found in Colorado, Utah, Wyoming, Nevada, Montana, California, Texas, Kentucky and W. Virginia in the United States, but while extensive experimental work has been done on retorting and much chemical investigation has been conducted as to the nature, properties and behaviour of oil shale, the establishment of the industry on a commercial scale has not yet been accomplished in the United States. By far the greatest attention has been paid to the oil shales of the western states.

Alaska.—Oil has been found in several localities in Alaska, notably in the district between Icy Cape and Cape Ytatag, 400 m. N. W. of Sitka; in the Kayak field, several miles inland from Cape Suckling; in the Cook's Inlet field, between Itimma Peak and Itimma Lake; and in the Cold Bay field, opposite Kodiak Islands. Wells were drilled in the early 'nineties in the Kayak, Cook's Inlet and Cold Bay regions, but oil was not found in commercial quantity. In 1920 interest in Alaskan fields was revived, but no important drilling operations were reported. Production was 56,000 barrels.

Canada.—Canada's petroleum production declined steadily from 1908 to 1920. In 1920 the output totalled 198,425 bar. compared with 241,000 bar. in 1919 and 525,000 bar. in 1908. Virtually all of Canada's petroleum is produced in Ontario, and occurs in sandstone and limestone of Silurian and Devonian age. The gravity is about 30° Baumé (0-828 sp.gr.). A small production is obtained in New Brunswick and Alberta. In Aug. 1920 oil was discovered on the Mackenzie River, 150 m. S. of the Arctic Circle in the Canadian Northwest Territory. The well was located N.W. of Fort Norman, and on Aug. 23 1920 it began to flow over the top of the mast from a depth of 783 feet. After an uninterrupted flow of 40 minutes the well was capped.

The oil was analyzed as 38° Baumé (0.8,333 sp.gr.). This development attracted prospectors, the Dominion Government promulgating new regulations to apply to the unorganized districts affected by the discovery. Drilling in the Peace River district of the Northwest Territory also attracted attention in 1920 and 1921.

**Mexico.**—Mexico's petroleum development has been sensational in its rapid growth. Although yielding oil as early as 1901 it was not until 1910 that the production became a commercial factor. In the latter part of that year the famous Juan Casiano No. 7 well was drilled S. of the Dos Bocas well, the latter an uncontrolled gusher S. of Tampico, struck July 4, 1908, which went to salt water several months later. The equally famous Potrero del Llano No. 4 well came in Dec. 27, 1910 with an estimated initial flow of 10,000 bar. daily, increasing to 160,000 bar., and establishing itself as the largest producer up to that time. Both the Casiano and del Llano wells were in the so-called southern field as distinguished from the northern or Panuco field, these two fields being part of the Tampico-Tuxpam region. This lies in the northern part of the state of Vera Cruz and the southern part of the state of Tamaulipas. Oil in the Tampico region occurs in the Oligocene, Eocene and Cretaceous formations and is found in numerous pools. Before striking the big wells mentioned a considerable production had been developed at Ebano, 40 m. W. of Tampico, in the northern part of the Tampico-Tuxpam area and in the Tehuantepec area. The Tehuantepec-Tobasco area extends along the Gulf coast in southern Vera Cruz and the state of Tabasco. Its oil-bearing rocks are of the Pliocene and Pleistocene age, and it had not developed a large production up to 1921. Mexican crude oil ranges from 10° to 43° Baumé (1.000 to 0.8,992 sp.gr.), and generally becomes lighter from north to south. In the Panuco (northern) field it is from 10° to 14° Baumé (1.000 to 0.9,722 sp.gr.), and from 15° to 29° Baumé (0.9,655 to 0.8,805 sp.gr.) in the southern districts. Oil in the Tehuantepec field has a gravity of 32° Baumé (0.8,642 sp.gr.).

Generally speaking, Mexico's petroleum has been found in a succession of great gushers. Where these wells are isolated they have produced for long periods and in great volume. Where there is close and competitive drilling the exhaustion of the pools comes as a natural consequence. The explanation of the great gushers seems to lie in the very great porosity of the rock. Oil collects in a network of caves and channels previously dissolved out of a bed of thick limestone. This condition allows the petroleum to move about freely, while still underground. Furthermore, the petroleum generally lies over water under an artesian head, and as a consequence the field pressure is largely hydrostatic, causing the oil to flow. In 1908 the country was credited with an output of 3,932,900 bar.; in 1920, 163,000,000 barrels. The following table shows the production during that period:—

*Petroleum Production of Mexico, 1908 to 1920.\**

	Barrels	Metric Tons
1908	3,932,900	624,968
1909	2,713,500	431,175
1910	3,634,080	577,455
1911	11,552,798	1,994,640
1912	16,558,215	2,631,100
1913	25,696,291	4,083,141
1914	26,235,403	4,168,805
1915	32,910,508	5,229,480
1916	40,545,712	6,445,957
1917	55,292,770	8,790,583
1918	63,828,327	10,147,587
1919	87,072,954	13,843,077
1920	163,000,000	22,638,888

\**Boletín del Petróleo*; 1920 estimated.

In Jan. 1914, in the Panuco pool, a well with an estimated initial flow of 100,000 bar. daily was brought in, and further attention was attracted to this district in 1915 by the completion of an offset well estimated at 60,000 bar. daily. Political disturbances in Mexico from 1914 to 1917 seriously interrupted operations in the southern field. On Feb. 10, 1916, however, Cerro Azul No. 4 well in the southern district was completed. This well was credited with having flowed 260,858 bar. on Feb. 19 of that year, being estimated the largest producer ever drilled, and in May 1921 was continuing its steady yield. In Aug. 1914 seepages from Potrero del Llano were ignited by lightning, and the fire was not extinguished until March 1915. The completion of a good-sized well in 1915 in the Tepetate pool, a short distance N.W. of Casiano, was the precursor of the intensive lot-drilling campaign which this district saw in 1918 and 1919. In those years about 20 wells of large initial capacity were completed in this pool. The Alamo pool, the southernmost producing area in the Tampico-Tuxpam region, came into prominence in Oct. 1914, when the famous Alamo No. 2 well was brought in with an estimated potential production of 50,000 barrels. This well has probably produced 27,000,000 bar. of oil. The oil in the Alamo pool is from 16° to 22° Baumé (0.9,589 to 0.9,211 sp.gr.). Large wells of low-grade oil have been developed in the Molino field, just N. of Alamo. In 1919-20 large gushers were completed in the so-called Naranjos pool in the southern field. It was estimated that this pool produced 90,000,000 bar. in 1920, possibly the largest output in

history. Potrero del Llano No. 4 suddenly went to salt water in Dec. 1918. This occurrence caused wide comment, as it was the first instance of the approximate exhaustion of any of Mexico's prolific pools, if Dos Bocas is to be excepted. This well had produced up to that time about 100,000,000 bar. of oil, including seepage oil. The Juan Casiano No. 7 well went to salt water in Nov. 1919, having produced about 80,000,000 bar. of oil. Many of the large wells in the Tepetate pool were affected by salt water in 1919 and 1920. Salt-water invasion was also reported as serious in the Panuco field. The Zacamixtle pool in the southern district was discovered in 1920, yielding several large wells. In 1921 important wells were brought in in the Toteco district of the southern field between Zacamixtle and Cerro Azul. In 1920 it is estimated that this field produced 120,000,000 bar., all in a strip of land 42 m. long and less than a mile wide.

**Central America.**—No petroleum production has been developed in Central America, but prospecting has been done and some drilling was under way in 1920. Test wells have been sunk on Columbus I., east coast of Panama, and in the Estrella Valley of Costa Rica. Exploration work has been done in Honduras and Guatemala.

#### SOUTH AMERICA

**Argentina.**—Argentina's commercial production dates from 1908, when petroleum was found in a well being drilled for water by the Government near Comodoro Rivadavia, Chubut province, on the coast of Patagonia. The Government immediately reserved part of the oil-bearing land for a monopoly, and Argentina's petroleum development has been almost entirely in the hands of the administration. Oil occurs in nearly horizontal, supposedly Cretaceous, beds which are covered by Tertiary beds. The oil is heavy and of asphalt base and ranges in gravity from 18.9° to 21.8° Baumé (0.940 to 0.922 sp.gr.). Much attention was attracted to Argentina in 1921, when in Feb. the first large gusher to be opened in the Comodoro Rivadavia field came in with an estimated initial flow of 25,000 bar. daily. Argentina's oil production was 1,665,989 bar. in 1920, compared with 1,183,000 bar. in 1919.

**Venezuela.**—Active prospecting in Venezuela began in 1910, and during the next four or five years wells were drilled in several areas with varying success. A well in the Mene Grande field, on the east coast of Lake Maracaibo, Sucre district, drilled in 1913, established the occurrence of oil in paying quantity, and by 1915 the field had developed a considerable production, furnishing up to 1921 practically all the Venezuelan output. Drilling in the district of Colón, state of Zulia, commenced in 1914. Four wells credited as good producers in the Rio Oro and Rio Tarra sections had been completed by 1916 and were shut in. Two wells reported as proven in the Bolívar district, state of Zulia, were also capped. Operations in Venezuela in 1920 and 1921 were active, particularly in the Lake Maracaibo district. Venezuela's production in 1920 amounted to 456,996 bar., compared with 425,000 bar. in 1919. In 1920 the Mene Grande field was credited with having seven flowing wells, the oil being of about 16° Baumé (0.9,380 sp.gr.). The capped wells in the Rio Oro district are said to produce a high-grade, paraffin-base oil of about 36° Baumé (0.8,433 sp.gr.).

**Colombia.**—Although not ranking as an oil-producing country, in 1920 Colombia was credited with three wells of potential commercial importance. These were completed in 1918 and were shut down awaiting marketing facilities. The wells were drilled on a concession in the Rio Colorado region in Santander del Sur. They are located about 30 m. S. of Barranca Bermeja, which is 350 m. from the mouth of the Magdalena river. Oil from these wells is reported to test 26° to 31° Baumé (0.8,974 to 0.8,696 sp.gr.). Preparations for opening the wells had been made early in 1921 upon the completion of a pipe line and refinery. Drilling was accomplished in 1920 and 1921 on other concessions along the Magdalena river in the vicinity of the pioneer Colorado development. Development work was also undertaken in 1920 on a concession in the Venezuelan boundary region in Santander del Norte, on the Rio del Oro, opposite drilling work in the Colón district of Venezuela. Considerable interest was attached to Colombia petroleum development in 1911 when drilling was undertaken near Cartagena. In 1913 and 1914 wells were drilled in the Loricio district near the Sinu river, but production was not encountered in commercial quantity. The Magdalena-Santander field occurs in the Cretaceous limestone and sandstone and the coal-bearing Lower Tertiary (probably Oligocene) beds. The rocks of the Caribbean fields are similarly described.

**Peru.**—Peru has the distinction of being the oldest oil-producing country in S. America, first being credited with production in 1896. Its production has been steadily maintained, the principal fields being Negritos, Lobitos and Zorritos. Another petroliferous district near Lake Titicaca has not developed any considerable production. Oil is found chiefly at the north end (Pacific coastal district) of Peru, and occurs in several horizons of soft sandstone and shale of early Tertiary age. The oil ranges from 32° to 48° Baumé (0.8,642 to 0.7,865 sp.gr.). Peru's production in 1920 was 2,816,649 bar.; 1919, 2,616,000 bar.; 1908, 1,011,180 barrels.

**Bolivia and Ecuador** have been actively prospected for oil, but oil in commercial quantity has not been developed. Chile had several oil booms, particularly those based on the oil deposits of the province of Punta Arenas, N.W. of Tierra del Fuego, without successful results. Prospecting has been undertaken in Brazil and Uruguay.

WEST INDIES

*Trinidad.*—The oil fields of Trinidad are mainly in the southern part, and the oil is obtained from lenses of sandstone of Tertiary age. Trinidad first appeared as an oil producer in 1908, although wells were known to exist N. of the famous Pitch Lake at Guayaquayare, in the extreme S.E. of the island, in 1902. This district came into real prominence in 1908 when a well at 700 ft. spouted oil over the derrick. A rapid development followed. Oil in the Pitch Lake district varies in density from 14° to 25° Baumé (0.9,722 to 0.9,032 sp.gr.). In the latter part of 1911 regular oil shipments from Brighton began. In that year several large gushers were brought in, but immediately clogged, owing to sand. In 1913 a well came in rated at 40,000 bar. daily, but sanded up, and in subsequent years other large producers have been reported, the initial production of which has soon fallen off on account of sand. Trinidad's production in 1920 totalled 2,083,027 bar., compared with 1,841,000 in 1919.

An oil boom in Cuba in 1917 failed to yield any considerable production. The principal development was in a field near Havana. Prospecting and a little drilling work have been done in *Santo Domingo*. There was exploration work in *Barbados* and in *Haiti*.

EUROPE

*Russia.*—While Russia, as a result of the World War and the revolution that followed, dropped in world rank as regards petroleum production, it remained the largest European producer. Production is found in Tertiary clays and sands. Baku oils are of about 27° Baumé (0.8,917 sp.gr.), while in the Suragany district of Baku province the oil is as high as 48° Baumé (0.7,865 sp.gr.). The production in 1920 was estimated at 25,429,600 bar.; 1919, 25,498,000; 1918, 40,450,182; 1917, 69,960,000; and in 1908, 62,186,447. The relatively small area comprising the Baku field supplies the bulk of Russia's production. Other productive fields are the Grosny, Maikop, Ural-Caspian (Emba) and Tchelen fields. The Maikop field in the province of Kuban on the north flank of the Caucasus, N.E. of the Black Sea, was discovered in 1910. The finding of high-grade oil in a well flowing at the rate of 37,500 bar. daily caused an extraordinary rush. In 1915 the sensation in this field was the completion of a gusher credited with an initial flow of 60,000 bar., which maintained a large, steady production from March 23 to the close of the year. Maikop oil is about 40° Baumé (0.8,235 sp.gr.). The Ural-Caspian field, covering a large area in the Emba-Uralsk region round the north end of the Caspian Sea, first became a commercial factor in 1913. The district came into prominence on the completion of a well in May 1911, which at a depth of 732 ft. gushed with great violence. It began to flow in Feb. 1912, was closed down and reopened in Oct. 1912, producing 120,000 poods (1,944 tons or 14,480 bar.), and then settling down to 50,000 poods. (One pood equals 36.112 lb.) This famous gusher is estimated to have produced from 8,500,000 to 9,000,000 poods. Emba oil is about 28° Baumé (0.8,861 sp.gr.).

For many years the I. of Tchelen, off the Asiatic coast of the Caspian Sea near Krasnovodsk, was the scene of moderate operations, but from 1911 onwards large yields were obtained from wells sunk in the Ali Tepi district in the south-western part. Tchelen oil is about 22° Baumé (0.9,211 sp.gr.).

*Galicia.*—No new pools of importance were discovered in Galicia during the period 1908-20. Galician production showed a declining tendency beginning in 1910, and during the World War this condition was aggravated, as the fields were battlegrounds. Galicia's largest output is obtained from Eocene beds. The chief producing districts are: in eastern Galicia, Boryslaw-Tustanowice, Bitkow; in western Galicia, Bobrka, Potok and the Gorlice district. The bulk of Galicia's production comes from the Boryslaw-Tustanowice district. Boryslaw oil is 32° to 34° Baumé (0.8,642 to 0.8,537 sp.gr.), and is the standard market grade for Galicia. Bitkow oil is about 53° Baumé (0.7,650 sp.gr.); Bobrka, about 31° Baumé (0.8,696 sp.gr.); Potok, 34° to 45° Baumé (0.8,537 to 0.8,000 sp.gr.). Galicia's production in 1920 totalled 5,606,116 bar.; 1919, 6,054,000. The peak of production was in 1909, 14,932,799 barrels.

*Rumania.* like Galicia, a battleground during the World War, suffered in petroleum production. Most of the oil is obtained from Miocene and Pliocene beds, but part is obtained from Eocene and Oligocene and possibly from Cretaceous beds. The principal fields are Bushtenari, Campina, Moreni, Filipeshti, Baioci and Bauzau. The oil is from 25° to 45° Baumé (0.9,032 to 0.8,000 sp.gr.). Production in 1920 was 7,435,344 bar.; 1919, 6,614,000; and in 1908, 8,252,157. The peak was reached in 1913, 13,554,708 barrels.

*Yugoslavia.*—In 1921 drilling began on concessions in Croatia.

*Germany.*—Oil is obtained largely at Hanover, where it occurs in domes associated with rock salt. The rocks are chiefly limestone and sandstone of upper Jurassic age. Oil at shallow depths is heavy, gravity from 17° to 19° Baumé (0.9,524 to 0.9,390 sp.gr.); at greater depths the oil is lighter. The production is not large, and in 1920 was 212,045 bar.; in 1919, 234,000.

*France.*—Production in Alsace occurs in sandstone of Eocene and Oligocene age and is comparatively small. The gravity ranges from 25° to 29° Baumé (0.9,032 to 0.8,805 sp.gr.). In 1920 the output was about 388,700 bar.; in 1919, 344,000.

*Italy.*—Italy's production, relatively small, is chiefly in the Emilia district of Lombardy on the north-eastern slope of the

Apennines. Oil occurs in sandstones of Eocene and Miocene age, and ranges from 31° to 48° Baumé (0.8,696 to 0.8,187 sp.gr.). Production in 1920 amounted to 34,180 bar.; in 1919, 35,000; and in 1918, 50,966.

*Great Britain.*—Apart from the shale-oil industry of Scotland and Wales, Great Britain took its place as a petroleum-producing country in 1919, when the Hardstoft well was brought in in Derbyshire. This was one of 11 drilling locations, seven of which were in Derbyshire, two in N. Staffordshire and two in the Midlothian district of Scotland. The Hardstoft well was started in Oct. 1918, and struck oil in May 1919 at 3,078 ft. At 3,100 ft. it produced 10 or 11 bar. daily. The well was still overflowing naturally at the end of 1920. Up to that time its production totalled 4,575 bar. or 590 tons, of which 2,909 bar., or 375 tons, were produced in 1920. At the end of that year progress on the other prospecting wells stood as follows: six wells had reached 3,000 ft. or over, the deepest, Ironville No. 2 in the Derbyshire area, being shut down at 4,500 ft. pending results of Ironville No. 1. One new well was started in 1920, Apedale No. 2 (Staffordshire), to replace Apedale No. 1, which had to be abandoned. This development is undertaken by the British Government, although the operations are managed by a private company. Oil from the Hardstoft well tested 40° Baumé (0.8,235 sp.gr.).

Considerable production of petroleum is derived from the Scottish shale-oil fields in the territory from Dalmeny and Abercorn on the Firth of Forth southward to the district of Cobbinshaw and Tarbrax. The oil-shale industry in Scotland has been in commercial operation since 1850, and in 1920 there were 25,000 persons regularly employed in this enterprise. In 1917 3,116,529 long tons of oil were produced from Scottish oil-shale. There is a small oil-shale production in England and in Wales.

AFRICA

*Egypt.*—Prospecting in Egypt resulted in the discovery of oil on the borders of the Red Sea and the development of small production in 1911. In 1913 several large wells were brought in in the Gensah district on the west shore of the Red Sea, near the junction of the Red Sea and the Gulf of Suez. In Oct. 1914 oil was struck in the Hurghada district, S. of Gensah, and up to 1921 Egypt's production had been confined to these districts. The oil occurs in sandstone and in cavernous, dolomitic limestone, associated with thick beds of gypsum of Miocene (Tertiary) age, accompanied in some places by thick beds of salt. The underlying Nubian (Cretaceous) sandstone also contains some oil. Egyptian oil is about 40° Baumé (0.8,235 sp.gr.). Difficulties from salt-water flooding have been encountered in the fields, shortening the life of the large wells. Exploitation has been restricted to a comparatively small area. While Egypt's production almost doubled in 1918 as a result of increased activities that year it fell off in 1919, and in 1920 showed a sharp decrease. Production in 1918 was 2,079,750 bar.; in 1919 1,501,000; and in 1920, 1,042,000.

*French Colonies.*—Some oil has been obtained in the Chelif river area in the district of Oran, Algeria. Over 30 wells have been drilled in the M Sila and Medjila districts, but during the World War operations were practically discontinued. Interest in Algeria revived after the war. The oil-bearing formation is probably Upper Miocene and its structure is complex.

Prospecting has been active in Angola and Ashanti (Gold Coast), in the Tertiary coastal plain formations. Tests have been drilled in Angola and the Alto Daude district near Loanda and at Ambrizette. Showings of oil were reported in test wells drilled in the Betsiriry Valley, Madagascar, but no commercial production developed.

ASIA

*Persia* is looked on as a new petroleum-producing country of unusual importance. Development has been virtually confined to the Maidan-i-Naphtun field in northern Arabistan, about 100 m. N. of the head of the Persian Gulf, where the first wells were completed in 1908. In 1914 10 wells were reported as being operated, and 20 more were shut down at the top of the sand. In the neighbouring Maidan-i-Naphtek field one well had been drilled and capped and a second begun. One test well had started in the White Oil Springs district. The following year a total of 12 wells had been completed in the Maidan-i-Naphtun field. The wells were reported to be prolific, with a combined capacity of 5,000,000 tons a year. Early in 1920 it was stated that the wells still maintained their high rate of yield. One well, which has been continuously flowing since Nov. 1911, was giving a larger production than ever, maintaining a steady daily average of 11,000 bar. with the well only partly opened. Persian production in 1920 was 12,352,655 bar.; in 1919, 6,412,000; in 1918, 6,856,061. Oil in the chief producing area occurs in the Miocene series. The gravity of the oil is about 21° Baumé (0.9,272 sp.gr.). In addition to the Maidan-i-Naphtun field, the Ahwaz-Pusht-i-Kuh and Gishon I. and the Persian Gulf regions are expected to yield petroleum.

*Mesopotamia.*—There are several petroliferous areas in Mesopotamia in the Tigris-Euphrates basin. Primitive development has yielded some oil in the Kirkuk-Mendali-Kas-i-Shirin area north of Bagdad, in the Middle Tigris belt and in the Euphrates belt. Large-scale development of the Mesopotamian fields was interrupted by the war, but interest in them revived in 1920 and 1921.

**Palestine.**—The first drilling for oil in Palestine, S.W. of the Dead Sea, was interrupted by the war. Prospecting had previously been active in the area between the river Jordan and Deraa, adjacent to the Hedjaz railway.

**India.**—The principal source in India is the Yenangaung field in Burma, about 272 m. N. of Rangoon on Yenangaung creek. Other important districts are the Singu, Minbu, Pakokku and Upper Chindwin. The oil is in rocks of Miocene age and is about 30° Baumé (0.8750 sp.gr.). Deep drilling was a feature of the development in this field after 1914. Some wells come in with a large initial flow but fall off rapidly as the territory has been intensively developed. Coal-bearing rocks of Eocene age have yielded oil in small quantities in Assam and in the Punjab. India's production in 1920 was 7,500,000 bar.; in 1919, 8,735,000; in 1908, 5,047,038.

**Japan and Formosa.**—Japan's principal oil production is found in the Echigo Province field. Since 1908 the most important development has been in Akita prefecture. The first gusher was drilled in this field in May 1914, flowing at the rate of 12,000 bar. daily. Many other large wells have been developed. The Akita gushers have declined rapidly. Oil is obtained from coarse sandstone layers, interstratified with sandy shale of Tertiary age. The oil is about 25° Baumé (0.9032 sp.gr.). A small production is also obtained in Formosa. Production of Japan and Formosa in 1920 was 2,139,777 bar.; in 1919, 2,175,000; and in 1908, 2,070,145.

**China.**—A joint investigation of petroleum resources in the provinces of Shen-si and Chih-li was undertaken in 1914 by the Chinese Government and a private corporation. Drilling of six wells began in the Yen-chang field, Shen-si, where previously a number of primitive wells had been put down and a small production obtained. In 1916 the abandonment of the enterprise was announced. No oil in commercial quantity was struck.

#### OCEANIA AND THE EAST INDIES

**Dutch East Indies.**—Production of petroleum in the Dutch East Indies has shown a steadily increasing tendency. Production is obtained in Sumatra, Borneo and Java. Most of the oil-bearing rocks are associated with beds of coal and lignite of Miocene age. Oil of the Langkat district of Sumatra has a gravity of 33° to 55° Baumé (0.8589 to 0.7692 sp.gr.). Java oil is heavier, ranging between 23° and 40° Baumé (0.9,150 to 0.8,235 sp.gr.). Borneo oils from shallow wells have a gravity of about 14° Baumé (0.9,722 sp.gr.), and from the deeper wells a gravity of from 27° to 33° Baumé (0.8,917 to 0.8,589 sp.gr.). Production of the Dutch East Indies, including a small production from British Borneo, totalled 17,529,210 bar. in 1920; 15,428,000 in 1919; and 11,041,852 in 1908.

**Papua.**—Test drilling has been undertaken in Papua, and, while oil has been struck, difficulty has been caused by mud clogging.

**Philippine Islands.**—Prospecting and drilling work started in the Philippine Is. in 1920 in the Bondoc Peninsula district.

**New Zealand and Australia.**—Extensive prospecting and drilling work have been done in New Zealand, especially in the vicinity of New Plymouth; South Australia, in the Robe district, and in Queensland, in the Roma district. Exploitation in these districts has failed to develop petroleum production in commercial quantity. New South Wales has developed an oil-shale production amounting in 1918 to 32,395 long tons.

**Oil in the World War.**—Petroleum was a major essential in industrial, military and naval operations in connexion with the World War. Industrial plants required abnormally large quantities of lubricating oils and fuel oils. There was a rapid expansion in oil-burning fleets, and a new demand on petroleum was made by air craft, by the introduction of petrol-burning motor launches, by tanks used in military operations, and by the creation of the motor transport, which became a chief factor of a mobile army. Petroleum was a contraband of war, and German submarine warfare was largely directed against petroleum tank steamers. Military operations in Galicia and also in Rumania were dictated to a considerable degree by the condition of petroleum supply in the Central Powers. Galicia changed hands several times during the war, and after Rumania's entrance into the war in Sept. 1916 the oil fields of that country fell into the hands of the Austro-German armies. Considerable damage to the Galician and Rumanian fields was caused by military operations, and the output of these countries was reduced during the war. Before the capture of the Rumanian fields a systematic destruction of wells, derricks and oil supplies had been undertaken by an Allied military mission, and the Germans immediately installed a military commandant with trained assistants to rehabilitate the fields. The operations of Turkey against Russia had the Baku oil fields as their objective, and the early British operations in Mesopotamia were chiefly intended as a precautionary measure for the protection of the Persian oil fields.

In all the warring countries special Governmental departments were organized to handle petroleum problems, and in almost every country drastic restriction of home consumption was enforced. In England the Mineral Oil Production Department had jurisdiction over all questions of production of oil from home sources. The Pool Board attended to the distribution of oil in the British Is., and the Petrol Control Department acted on matters of petrol economy. The Petroleum Executive was formed in Aug. 1917 to handle matters of general policy. In France jurisdiction of petroleum matters was placed in the hands of a Commissioner-General of Petroleum, and a Petroleum Importing Consortium was created. During the last year of the war a Government commission for petroleum was formed in Italy, and throughout the war restrictions were placed on the importation and sale throughout that country. In Germany and Austria price and distribution were under control somewhat similar to that of food, and strict rationing was adopted. After the United States entered the war in 1917 a voluntary organization of the American industry was effected under the name of the National Petroleum War Service Committee, and in 1918 the Oil Division of the Government Fuel Administration was established. Restrictions on home consumption in the United States were confined entirely to voluntary methods. The Inter-Allied Petroleum Council, consisting of representatives of Great Britain, the United States, France and Italy, was formed in 1917. This Council arranged for the requirements of each of the Allies and for the transportation of the petroleum allotted.

America supplied 80% of the Allied petroleum requirements. The problem of transporting these great quantities was only secondary to the problem of production. Large additions were made to tanker fleets, principally of Great Britain and the United States, but as there was an inadequate supply of tankers early in the war, and as the German submarines sank many; this feature of the transportation problem was particularly serious. It became necessary to use the double bottoms of cargo vessels for transporting oil, and it is estimated that from 1917 to the close of the war 1,100,000 tons of fuel oil were so transported. The total quantity of fuel oil brought to British bases during the war exceeded 10,000,000 tons, of which 9,100,000 tons were issued to the British Admiralty. In addition American naval tankers imported 560,000 tons, which were distributed by small British craft to U.S. naval units along the British coast. The tanker-building programme, projected by the British Admiralty in the early stages of the war, resulted in the addition of 52 cargo tankers of 380,000 tons' capacity and 49 fleet auxiliaries of 95,000 tons' capacity. In 1918 there were 2,628,961 tons of fuel oil alone shipped from the eastern seaboard of the United States for the use of the Allied navies. In the same year more than 1,000,000 tons of distillates and other petroleum products also crossed the Atlantic, entailing more than 500 tank steamer loadings. The figures made public after the war showed that 48% of the British fleet was depending on oil for fuel. The maintenance of the blockade round the Central Powers involved the steady consumption of petroleum products. In the patrol around the British Is. the steaming of the fleet and other vessels averaged not less than 7,000,000 m. a month. At one time the situation as regards tank steamers was so serious that a single day's delay in any of the vessels caused considerable anxiety. In May 1917 stocks of oil were so low because of heavy shipping losses, due to submarines, that the fleet was unable to exercise properly and the army was frequently on a hand-to-mouth basis. At that date total stocks of oil in Great Britain amounted to only 900,000 tons, and the absolute minimum of safety was considered 1,500,000 tons. After 17 months stocks had been increased to 1,800,000 tons, and on cessation of hostilities the stock was considered satisfactory.

A campaign of intensive development in the petroleum fields, particularly of the United States and Mexico, brought about large increases in petroleum production, but requirements were so great that despite this increase stocks had to be drawn on heavily. At the close of the war American tankers afloat had increased 635,507 gross tons, and 51% of the total gross tonnage of tankers in

service between America, Great Britain, France and Italy was American owned, while 49% was British owned. Because of the increased tonnage at the close of the war the United States was exporting each month for war purposes 2,200,000 bar. of fuel oil, 750,000 of motor gasoline, 500,000 of kerosene and 175,000 of aviation naphtha. The country's exports of fuel oil to Great Britain, France and Italy in 1918 represented an increase of 200% over 1914 and 23% over 1917. At the beginning of 1917 the total requirements of petroleum products for all British services reached a figure of about 3,500,000 tons per annum, nearly double pre-war requirements. By the end of 1918 the figure had increased to nearly 5,500,000 tons per annum. It is estimated that the maximum requirements of the Allies if the war had continued would have occurred in the spring of 1919, when 12,000,000 tons per annum (of which some 8,000,000 tons would have been absorbed by Great Britain) would have been required. During the last 18 months of the war the Inter-Allied Council dealt with between 12,000,000 and 13,000,000 tons of oil.

The British army in France used about 23,000 tons of motor spirit a month during the greater part of the war. The French army's monthly consumption of gasoline was 35,000 tons, of which 30,000 tons came from the United States. In Dec. 1917 the Allies had a scant month's supply of gasoline on hand, and between Dec. 25 1917 and Jan. 31 1918 90,000 tons of petroleum products were shipped to France from the United States, making possible the shifting of troops into threatened areas by motor lorries. Oil stocks in France, before the large shipments early in 1918, had gone down to 25,000 tons, less than the average held in France in normal times. During the days of most active fighting consumption reached as much as 2,000 tons a day. The British Ministry of Shipping was mainly responsible for the transporting of overseas supplies, and the Tanker Division of the Emergency Fleet Corps, U.S. Shipping Board, and a section of the War Trade Board had jurisdiction of the allocation of cargoes and of shipping belonging to the United States. The difficulties of getting production were accentuated by various specifications which each Government required as regards its oil supplies, and steps were taken by the Inter-Allied Council to effect some degree of standardization. In the United States the Committee of Standardization of Petroleum Specifications was formed to standardize petroleum products, requirements of the various Government departments, and also to recommend adoption by the states of standard specifications.

The war opened the eyes of all countries to the value of petroleum products. The Allied countries and the Central Powers conducted extensive investigations to provide substitutes. In Great Britain the Alcohol Motor Fuel Committee was formed to consider the fields of production of alcohol fuel, and its utilization either alone or in conjunction with fuels such as petrol and benzol. Efforts were successfully made to extract crude oil from cannel coal on a commercial scale at certain large gas works. The use of coal-tar oils as fuel oil was also considerably increased. Alcohol substitutes for petroleum were extensively experimented with in Germany and in the United States. In the latter country important experiments were made with colloidal fuel. The actual work of petroleum development in the British Is. was undertaken as a war measure, and, as already stated, the drilling of wells was started in Derbyshire, Staffordshire and the Midlothian district of Scotland on behalf of the British Government. Another war achievement was the construction of an 8-in. pipe line, 35 m. long, across Scotland from the vicinity of Glasgow to Grangemouth on the Firth of Forth. This pipe line was built so that tank steamers could discharge fuel oil for the Allied navies at Old Kilpatrick, near Glasgow. The pipe line then conveyed the oil to the Firth of Forth, where it was required by the navies. Tanker transportation to the Firth of Forth was very dangerous. The work of building the stations and ditching for the line was conducted by the British Admiralty, and the line laid by a U.S. naval unit. It was completed shortly before the Armistice was signed. The war also probably hastened the building and completion of the British navy's great oil reservoir at Rosyth. This was con-

structed of reinforced concrete, and is capable of storing 60,000,000 imp. gal. of liquid fuel. Concrete work on the first section began in July 1916, was completed in Aug. 1918, and oil was run into the tanks in Sept. 1918. Construction of the second section began in Aug. 1917, and was completed early in 1919.

Certain important producing and potentially productive oil areas changed nationality as a result of the World War, including parts of Galicia, formerly in the Austro-Hungarian Empire, now a part of Poland; Alsace, now French; Mesopotamia and Palestine, lost by Turkey, and placed under British mandate.

*Financial and Industrial Progress.*—The expansion of petroleum activity has involved a great increase in financial requirements. While the tendency has been toward consolidation and the perfecting of organizations of great size, there has also been, particularly in the United States, an extraordinary springing up and expansion of companies embracing one or two branches of the business, or often operating in almost every branch. The chief petroleum companies own or lease oil-bearing properties, work their own production, have pipe-line affiliations, own and operate refineries, own and lease tank cars and other marketing equipment, and own and operate tank steamers.

The nationalization of oil-bearing lands—the retention or vesting of ownership of subsoil rights in the hands of the State—has been a pronounced tendency in certain countries. In Russia petroleum lands were nationalized and were operated in part of 1919 and in 1920 by the Soviet Government. Argentina's petroleum development has been almost entirely in the hands of the Government since its inception. In May 1917 a new Mexican constitution provided for the nationalization of petroleum, and various decrees have been promulgated attempting to carry out the nationalization principle. In other Latin-American countries nationalization of petroleum lands is generally adhered to in working out new petroleum codes. Direct Government interest in petroleum development was brought about in Great Britain by the action of the British Government in becoming a majority shareholder in an oil company developing the Persian fields and active in other countries.

The importance of petroleum with respect to national security and industrial prosperity became generally recognized during the World War and resulted in intense investment and speculative interest in oil companies. Statistics compiled for 250 representative American oil companies showed capital invested as of Dec. 31 1919 to be \$2,501,939,914. Of this group 142 companies were organized after 1912. The 108 companies in existence prior to 1912 showed a capital investment of \$717,098,563 on Dec. 31 1911. The compilation showed that of the total increase in capitalization between 1912 and 1919, amounting to \$1,784,841,351, \$707,004,521 was added in one year, 1919. New oil companies formed in the United States in 1917, 1918, 1919 and 1920 represented an amazing capitalization. The records show that in 1920 1,712 companies were organized with an authorized capitalization of \$2,787,000,000; in 1919, 1,629 companies with \$3,786,000,000 capital; in 1918, 820 companies with \$1,430,000,000 capital; and in 1917, 512 companies with \$840,000,000 capital.

Capital-borrowing by oil companies in the United Kingdom in 1919 totalled £15,852,600; in 1920 £13,004,600. The total capital of oil and kindred companies registered in the United Kingdom during 1920 was £33,105,050.

Four companies in Germany, classified under the head of "Petroleum, Mineral Oil, etc.," increased their capital in 1920 101,850,000 marks. There was a boom in the oil business in Rumania in 1919 and 1920. In the former year 128 new companies were organized with a total capitalization of 449,000,000 lei (nominal value 93d. or \$1.19, but at that time much depreciated). Up to Oct. 1920 168 companies had been organized with an issued capital of 1,640,206,900 lei.

*Well-drilling and Field Improvements.*—Production is maintained and increased only by the constant drilling of new wells. A territory becomes "proven" after it has been demonstrated by test wells and by active development to have petroleum deposits. The search for oil in unproven territory is generally termed "wildcatting." The wildcatter is sometimes a small operator but more often in recent years a large company, for the operation entails large expenditure.

In the United States, which in 1920 supplied 65% of the world's production, it is generally estimated that from 25% to 40% of current output is "flush" production; that is, production from the large initial flow of new wells, which subsequently would decline to moderate "settled" production or become exhausted. There were about 35,000 new wells completed in the United States in 1920; 24,000 of them were rated as oil producers. At the end of that year there were 7,200 wells drilling and 2,100 rigs erected or building for drilling. The number of wells producing oil in the United States, Oct. 31, 1920, was 258,600. The average per well was 4.9 barrels.

The principal drilling systems are: (1) percussion, which includes the standard cable tool (American system) and the pole tool (Canadian system); (2) hydraulic rotary system; (3) combination system; (4) hydraulic circulating system (see 21,319). In the Appalachian region of the United States wells are sunk by the standard or churn system, with a modified light rig, and range in depth from a few hundred feet to 3,000 or 4,000 feet. In many sections groups of wells are pumped from the central station. The yield of wells in the Appalachian field is small, the average for Pennsylvania being about 0.3 bar. per well; New York, 0.2 bar.; Kentucky, 3.1 bar.; W. Virginia, 1.1 bar.; and eastern Ohio, 0.8 barrels. Wells in the mid-continent field are generally drilled by standard tools. The cable system is used in central Texas, and the rotary system in northern Texas and in some districts of Oklahoma. The rotary system exclusively is used in northern Louisiana. The depth ranges from 200 ft. to 3,500 ft., drilling in recent years averaging more than 2,000 ft. Recoveries per acre from mid-continent pools have been generally higher than in the eastern fields, but less than in the Gulf coast and California. The average production per well in Oklahoma and Kansas is 6 bar.; northern Texas, 3.6 bar.; central Texas, 22.9 bar.; and northern Louisiana, 31.6 barrels. The rotary method is used exclusively in the Gulf coast field, the depth of wells ranging from 1,000 to 3,500 ft., and the production per well being 34.6 bar. in coastal Louisiana and 49.7 bar. in coastal Texas. In the Rocky Mountain field the standard and rotary systems are used, the shallow districts of this field also being largely drilled by the standard cable system with the portable rig. The depth of the wells ranges from 1,000 to 3,500 feet. The average production per well is 55.9 barrels. In California drilling is about evenly divided between the standard and rotary systems. The combination rig is also extensively used, and there is some drilling by the hydraulic circulating system. Well-depths range from 1,000 to 3,500 ft. and the average production per well is about 32.3 barrels. A well of average depth in the mid-continent field could be drilled and equipped for less than \$13,000 in 1913. In 1915 the cost increased to about \$14,000; in 1918 to \$24,000; and in 1920 to about \$32,000. A factor in the advance in cost was the increased depth of the average well. Drilling cost of an average well in central Texas in 1920 was from \$44,000 to \$68,000; in certain Gulf coast pools, \$39,000; while in the Rocky Mountain and California fields it has risen above \$100,000 per well.

In Mexico, where the wells usually have a great initial production and where the yield of individual wells is often restricted only because of inadequate marketing facilities or as a precaution against water inroads, the percentage of current production that might be termed "flush" is much higher than in any other producing country. Mexico's production is obtained from comparatively few wells. The country was credited on Jan. 31, 1921, with 357 producing wells, but it is estimated that the bulk of the 1920 production of 163,000,000 bar. was obtained from about 200 wells. The wells average about 2,000 ft. in depth. In the Tehuantepec field the wells have been of shallow depth and short-lived. Drilling in Mexico is about evenly divided between the rotary and standard cable system, and the hydraulic circulating system is used to some extent.

The Canadian pole tool system is used in Canada, while the deeper drilling in the Calgary district has been done by the standard cable system and there has also been some rotary drilling. Wells in the Petrolia district, Ontario, are about 500 ft. in depth and yield from 5 to 25 bar. a month. The standard cable system is principally used in Venezuela, although there has been a good deal of drilling with the rotary method, and a combination of both. Wells in the Mene Grande fields range from 600 to 1,700 feet. Wells in Colombia have been drilled by the cable system and combination cable and rotary, the depth being 1,700 to 2,300 feet. In Peru most wells in the Zorritos field are between 600 and 2,000 ft. in depth; in Labitos from 2,000 to over 3,000 ft.; and in Negritos the average is about 2,500 feet. The standard cable system of drilling is generally used in Peru, but there has been some rotary drilling in the Zorritos field, where a total of 920 wells had been drilled up to 1919, the greatest number of producing wells at any one time being about 50. In Labitos a total of 118 wells were producing in 1919; in Negritos 732 were active. Drilling in Argentina has been done by practically all methods, but the one in most general use is the Galician pole tool system, which is a modification of the Canadian pole tool system, the equipment providing for a larger and heavier rig. The American standard cable system is also in use in Argentina and there is some rotary and also hydraulic circulating drilling. Production in 1919 was obtained from about 72 wells. In Trinidad wells range from 700 to 1,740 ft. in depth. Rotary drilling is used almost exclusively.

The Russian free fall system, a modification of the Canadian pole tool system, is used in Russia. In this, there is a free fall of the tools,

which are then picked up. The diameter of some of the Russian wells is unusually large, the starting diameter being in many cases 36-40 inches. In the Baku field the depth of the wells ranges from 2,000 to 2,500 feet. Baku wells are famous for their large initial flow and large total yield. In Galicia, as well as in Rumania, the Canadian pole tool system, modified and adapted, is generally used, but the hydraulic circulating system is also used. Galician fields require deep drilling, many wells in Boryslaw-Tustanowice being over 4,000 feet. The pole tool system is also extensively used in Rumania. Wells range from 1,000 to 2,500 ft. in depth, and in the Moreni district wells of great capacity have been brought in. The standard cable system with portable rig is used almost exclusively in Italy. The same system, without portable rig, is used in Persia, India and Egypt. The Galician pole tool system is used in the Dutch East Indies. Persian production is obtained at from 1,100 to 1,400 feet. Deeper drilling was resorted to in the Yenangaung field of Burma with good results, previous drilling not having exceeded 300 or 500 feet. Wells more than 2,000 ft. deep are drilled in the Singu field of India. Wells in Japan range from 600 to 2,000 ft., and the rotary system, introduced in the Akita field in 1913, is used almost exclusively. The diamond drill, a "core" drill used in prospecting for coal, iron and copper deposits, has been introduced as a geological aid in oil-field work. Another means recently employed for drilling test holes and shallow wells is a combination rotary, core and churn drill. Petroleum development of recent years has entailed deeper drilling with consequent heavier demand on oil-field materials. In the United States and in other countries the shallow fields have become exhausted. Drilling to 2,500 and 4,000 ft. has demanded sturdier equipment, heavier and larger casing and improved designs in drilling machinery. Better methods of handling heavy wrenches and bits and of dressing bits have been adopted.

New mechanical devices to aid in well-drilling are constantly being introduced. In electrical rotary drilling, an electric device keeps a check on the drilling crews, indicating when and how long the rotary was shut down. A register giving the weight of pipe resting on the bit is being perfected by experimental tests. It is designed to enable the driller to determine the amount of speed to use in certain formations, with a view to lessening "twist-offs" and thereby lessening the number of fishing jobs. While derricks in most oil-producing countries are chiefly of timber, the all-steel derrick has appeared in certain fields of the United States, Rumania, Galicia, Trinidad, England and South America. Electric power has become a factor in field work and has been adopted for the pumping of wells and for drilling, for driving slush, water, oil and vacuum pumps and for air compressors, gas extractors, machine shops, field lighting and dehydration of oil. Electric power has made advances in Texas, in California and in the mid-continent fields. It has been adopted in Rumania and in the Balakhany-Saboontchy-Romany-Surakhany area and the Bibi-Eibat field of Russia. Electrification of the Yenangaung field of Burma has also been undertaken. The use of compressed air to increase oil extraction has been introduced recently in certain producing areas. The process consists of pumping compressed air or gas into some wells while others are pumped for oil. The advent of the internal-combustion engine has brought about the extended use of belt, chain and gear driven pumps, while previously single or duplex driven reciprocating steam pumps were mainly used. The turbine pump has also developed oil-field possibilities.

#### TRANSPORT AND STORAGE

**Pipe Lines.**—With its large crude-oil production obtained from fields often far from refining and consuming centres, the petroleum industry of the United States has developed pipe-line systems of great mileage and capacity (see 21,320). In the fields themselves there are networks of gathering lines connecting the wells with main trunk lines and railways, the trunk-line systems connecting the fields with the refining centres. It is estimated that pipe lines in the United States totalled about 35,000 miles. Practically all of the crude oil produced (1,300,000 bar. daily) is transported by pipe line, some of it only a few miles and some of it as far as 1,700 miles. About 150,000 bar. a day are taken from the eastern and mid-continent fields to the Atlantic seaboard through a connecting system of pipe lines. Mid-continent crude is also piped to the Gulf coast. It is estimated that the total U. S. production moves by pipe line an average of more than 500 miles. Pipe lines in Mexico have been constructed from the Panuco and Topila fields to Tampico and from the southern fields to Tampico and directly from the southern fields to the Gulf coast, where sea loading lines are installed. There is an international trunk line running into Canada connecting with lines in Ohio. In Venezuela the production in the Mene Grande field is run by pipe line about 35 m. to a refinery at San Lorenzo where there is also a terminal from which crude oil is barged to a refinery on the I. of Curaçao. A pipe line of about 25 m. has been constructed from wells in the Colorado district of Colombia to a refinery at Barranca Bermeja on the Magdalena river. The Lobitos field in Peru is connected by pipe line to the port of Talara, 16 m. distant, where there is a refinery and a terminal for export shipping. Argentina has short field pipe lines. In Trinidad there are pipe lines from the Pitch Lake district to refineries at La Brea and Port Fortin and also from this field and the Tabaguite district to Claxton's Bay, where they extend into sea loading lines. Pipe lines

run from the Galician fields to refineries located in and near the fields. Rumania's pipe-line system leads from the fields to refineries near and around Ploesti. A few days before Rumania's declaration of war a Government-owned pipe line was completed from Baicai to Constantza on the Black Sea. Oil from the Balakhany-Sabontchy-Romany-Surakhany oil field is piped to refineries on the outskirts of Baku. Oil from the Bibi-Eibat field is barged to the same place. A kerosene pipe line from Baku to Batoum on the Black Sea was completed in 1905. Grosny oil is piped to refineries near the town of Grosny. The Ural-Caspian fields are connected by pipe lines with Bolshaya Rakushka, where refineries are located. Tchelenk oil is shipped to Baku refineries. Oil from the Maikop field is piped to Ekaterinodar and to the port of Tonapse on the Black Sea.

Oil from the Gensah and Hurgahda fields of Egypt is transported by pipe lines to a refinery at Suez. Pipe lines connect the Maidan-i-Naphtun field of Persia to a refinery at tidewater located at Abadan. Oil from Singu and Yenangyang fields is piped to refineries near Rangoon, a distance of about 275 miles. Oil from the Langkat district of Sumatra is piped to refineries at Pangkalan on the Bay of Aroe. Southern Sumatra fields are connected by pipe lines to refineries at Pladjoe and Bagoes Koenig, both near Palembang. Java production is transported to refineries at Wonokrono and Tjepoe, Borneo oil by lighters to a refinery on the harbour of Balikpapan.

**Pump Stations.**—In the United States, pump stations are usually 30 to 40 m. apart in the eastern and middle states, but there are cases of long-continued operation of 120 m. with one pump station. A pump station usually consists of a pump house, boiler house, gate house, office and tanks. Diesel engines are being installed extensively in pumping stations.

**Sea Loading Lines.**—Sea loading lines have been installed and are operating in Mexico, Peru, Trinidad, Russia and other places. These lines make possible the loading of vessels several miles at sea and are usually installed where no deep-water harbours exist and where, because of the shallow water, the building of piers would entail prohibitive expenditure. The lines are submarine and are usually coupled ashore, stretched out on rails and drawn into the water by vessels. When it is impossible to couple the pipe ashore, this is usually done on barges or rafts and the line deposited as the work proceeds. The first sea loading line in Mexico was pulled in 1913 by the use of wooden dollies on a wooden track. At present numerous companies have sea lines along the strip of island beach between the Panuco and Tuxpam rivers.

**Storage.**—Crude-oil storage facilities, where steel tanks or reservoirs, are grouped together on what are generally known as tank farms, some of which in the United States have a capacity in excess of 24,000,000 barrels. Steel tanks are usually of 37,000 or 55,000 bar. capacity, placed about 500 ft. apart from centre to centre. Each tank is surrounded by a levee of sufficient height to hold the entire content of the tank and enclosed for the purpose of isolating fires. Crude oil is stored in steel tanks, concrete tanks and earthen reservoirs, while many of the lease tanks are wooden. There were held in the United States in pipe line and tank farm storage, at the end of 1920, 138,000,000 bar. of crude oil. In addition, 21,000,000 bar. of crude oil were stored in refineries. Tanks are installed at refineries for holding oil during the running at the plants and for storage preparatory to shipment to markets. Stocks of refined products held at U.S. refineries at the close of 1920 totalled 2,433,700,000 gallons. Investigation and experimentation are constantly directed to the reduction of evaporation losses of crude oil and refined products during storage. An investigation by the U.S. Bureau of Mines showed that in just one stage of handling of crude production in the mid-continent field, the volume of gasoline lost by evaporation equaled one-thirtieth of the total gasoline production of the United States. The loss occurred during a few days when oil was stored on leases before being taken by pipe line, and amounted in 1919 in the mid-continent field alone to 122,100,000 gallons. Insulated storage tanks of about 10,000 bar. capacity are being experimented with by a few mid-continent casing-head gasoline manufacturers.

Tanks are usually protected from fire by steam lines from the boiler house so that free steam can be turned into the tanks on the approach of a thunderstorm. This steam displaces the explosive mixture in the tanks. The water spray method is also used. At pipe-line stations, and-tank farms and refineries where there is a large number of tanks, a fire protective system which utilizes a frothy or foam mixture is often installed. This mixture has as its ingredients water, aluminium sulphate (crystal), sulphuric acid, ground glue, glucose, sodium bicarbonate and arsenious oxide. The system entails a piping and pumping system and the equipment includes solution tanks and foam-mixing boxes. Each storage tank has a mixing box into which pipe lines leading from the solution tanks discharge. The boxes are outside the tanks and the foam is admitted to the tank through a raised hatchway. The substance spreads over the surface of the oil. To insure the foam reaching the surface of the blazing oil at whatever depth without the bubbles being destroyed by the impact of the drop, a series of baffles is used retarding the descent. Tanks covered with a jacket of asbestos supported by steel framework are being experimented with. Submarine storage tanks, which if required can be rested on sea bottom, have been devised.

**Tank Vessels.**—The tank vessel plays a large part in the modern petroleum industry. It is used for transporting crude oil from produc-

ing countries and districts to refining countries and centres and for carrying refined products in bulk to the markets of the world. The world's tonnage of tank vessels (including steam, gas, sail and barge) increased from 1,525,000 gross tons in 1914 to about 4,000,000 tons at the end of 1920, with 1,100,000 tons under construction.

Great advances have been made in tanker construction and the loading and unloading of oil from tank vessels. The typical modern tanker carries 16,000 tons of oil, is equipped with quadruple expansion engines and boilers fired with liquid fuel, has a complete shelter deck the whole length of the vessel, oil-tight hatches and two pump rooms with pumps capable of discharging 1,200 to 1,500 tons per hour. The Diesel engine is also used for propulsion in some tankers, while the oil-fired steam-driven turbine is gaining headway. Oil cargoes are now loaded and discharged in a few hours. Devices have been perfected enabling vessels to take on a supply of fuel oil from tankers while under way on the high seas.

# REFINING

**Refinery Operations.**—The rapid expansion of the internal-combustion engine which, as developed in motor vehicles, began to be of importance as a consuming agency of petroleum products in 1907, has elevated gasoline (petrol) to the ranking by-product of crude oil. More recently the conversion of coal-burning vessels and industrial plants to the use of oil and the extension of utilization of the Diesel engine (an internal-combustion engine which does not demand so volatile an oil as gasoline) in the marine and in the industrial fields has placed fuel oil in a position of great prominence. Even so great an increase in crude-oil production as was recorded between 1908 and 1920 could not have supplied these consuming agencies had not refining methods been improved, new processes developed, and refinery capacity greatly expanded. As in the case of crude-oil production, the greatest refinery expansion has been in the United States, where in 1915 it is estimated there were 302 refineries with a crude-oil capacity of 1,043,245 bar. daily. On Jan. 1 1921 there were 415 refineries with a daily capacity of 1,888,800 barrels. The types of plants represented in this total were: 35 complete, 302 skimming, 60 wax and lubricants, 7 asphalt and 11 topping.

United States refineries in 1920 ran 434,000,000 gal. of crude oil, and produced 4,882,000,000 gal. of gasoline; 2,320,000,000 gal. of kerosene; 8,861,000,000 gal. of gas oil and fuel oil; 1,047,000,000 gal. of lubricating oil; 541,000,000 lb. of wax; 576,000 tons of coke; 1,290,000 tons of asphalt; and 1,492,000,000 gal. of miscellaneous oil. The principal refining centres in the United States are in the mid-continent territory, in the Pennsylvania region, and along the Atlantic, Gulf and Pacific coasts. Every large producing area has developed a refining industry, while the seaboard plants, in most instances, owe their location to strategic advantages respecting large domestic and export markets. Mexico has built up a substantial refining industry, although the largest proportion of its crude-oil production is transported to the United States for topping and refining, in most part by Atlantic and Gulf coast plants. Most of the Mexican plants are topping plants (that is, they divide the crude into tops, distillates and gas and fuel oils), but there are a few more complete refineries. All the refineries are located along or adjacent to the Gulf of Mexico or the eastern seaboard, comparatively near the producing fields. In 1920 there were 12 refineries reported in operation in Mexico with a daily capacity of 19,600 cub. metres of refined products. Four of these refineries were classified as complete plants, six as topping plants and two as natural-gasoline plants. There were five plants under construction, two complete refineries, one a topping plant and one a natural-gasoline plant. In 1920 61,000,000 bar. of Mexican crude oil were run by U.S. refineries. Canada has developed a substantial refining industry, these refineries operating on Canadian, United States, Mexican and Peruvian crude oil. There are one or more refineries or topping plants in Venezuela, the I. of Curaçao, Colombia, Trinidad, Peru and Argentina, these operating on domestic oil or oil from nearby territories. Galician crude oil is handled by refineries located within a radius of about 150 m. from the city of Lemberg, in and near the oil fields, and also by the Continental refineries in Hungary, Austria and Germany. It is estimated that Galician refineries are capable of handling about 40% of the crude production. Rumania's refineries are mainly located in the Prahova district and also in the Bacau, Dambovitza, Constantza and Neamt districts. In 1920 Rumanian refineries used 988,000 tons of petroleum, and produced 212,000 tons of benzine, 197,000 tons of lamp oil, 30,000 tons of lubricants and 473,000 tons of fuel oil. The output of the different refined products by Russian refineries in 1916 (last figures available) totalled 56,917 million poods of fuel oil, 6,926 million poods of lubricating oils, 135 million poods of solar oils, 944 million poods of benzine and 57 million poods of paraffin. Russian refineries are located at Blacktown, suburb of Baku, these running oil from the Baku fields, at Grosny and Bolshaya Rakushka and at Ekaterinodar and Shirvasky. There are local refineries in Egypt, Persia, India, the East Indies and Japan, and Persian oil is also being handled by a refinery at Swansea, Wales.

**Continuous Distillation.**—Continuous-process stills were first introduced by Norman Henderson, a British chemist, in connexion with the distillation of shale-oil. This system was subsequently adopted by many refiners of petroleum. A modification of Henderson's benches of stills was the addition to each member of the series

of a fractionating column, endeavouring to carry out the fractionating in one stage so that the one-bench stills would provide finished products. Similar considerations led to the development in California of the Trumble process, introduced by M. J. Trumble, a California chemist, consisting of an elaborate series of heat interchanges. In this process, oil is heated in a tubular furnace. It is dropped down a tower where, by means of distributors, it is brought in contact with the hot side of the column still and so gives a film evaporation. A recent modification of stills is the Allan system, introduced by Hugh Allan, a British chemist, whereby the oil is vaporized in the ordinary kind of Henderson still, but in place of being subsequently redistilled, or being collected via a column, vapours are blown into a series of vertical pipes, getting a fractional condensation from member to member, the latent heat of the high boiling components being used to reevaporate any condensed volatile oil, thus obtaining the fractions desired. Topping and skimming plants to raise the flash point and to dehydrate heavy oil have multiplied rapidly, particularly in the United States. The skimming industry is represented in all the major oil fields and has other purposes which give the plants practically a universal field in the oil industry, namely, to remove the lighter constituents of the oil for storage for a long period, thus reducing the losses from evaporation, to dehydrate or clean the oil and, in conjunction with a complete refinery, to remove the lighter fractions cheaply and quickly, leaving a residue to be re-run for lubricants, coke and other products.

**Cracking Processes.**—The commercial development of the cracking process subsequent to 1913 marked an epoch in the petroleum industry. The growing importance of the internal-combustion engine made necessary a higher yield of motor fuel from the limited crude-oil supply, if the demands of this consuming agency were to be met. Modern cracking dates back to the patent obtained in 1889 by the late Sir Boverton Redwood and Prof. Dewar, British chemists (see 21,322), but commercial development followed the first patent of Dr. W. M. Burton, an American chemist, in 1913.

The following classification of oil cracking processes (representative patents) is made by the Kansas City Testing Laboratory (*Bulletin No. 15*):

- I. Cracking in the vapour phase.
  - A. Atmospheric pressure.
    - Oil gas plants, very high temperature.
    - Pintsch gas plants, very high temperature.
    - Blaug gas plants, 1,000-1,200° F.
    - Parker (W. M.) process at 1,000° F. with or without steam.
    - Greenstreet Cherry red with steam.
  - B. With increased pressure.
    - Rittman process above 950° F. and 200-300 lb. pressure.
    - W. A. Hall process 1,100° F. and about 75 lb. pressure.
- II. Cracking in the liquid phase.
  - A. With distillation.
    1. At atmospheric pressure.
      - Luther Atwood (1860).
      - McAfee process with aluminium chloride.
      - Russian and American practice for illum. oils.
    2. Above atmospheric pressure.
      - Dewar and Redwood (1889).
      - Bacon and Clark at 100-300 lb.
      - Burton (Standard Oil Co.) 650-850° F. and 60-85 lb.
      - Dubbs, J. A., over 10 lb. and over 300° F.
    3. Very high pressure (over 27 atmospheres).
  - B. Without distillation and with high pressure.
    1. Without vapour space for equilibrium (continuous processes).
      - Benton (1860) 700-1,000° F. and 500 lb.
      - Goebel-Wellman.
      - Mark (English).
    2. With vapour space.
      - (a) Intermitent.
        - Palmer (below 27 atmospheres for aromatics).
      - (b) Continuous.

Dr. Burton's process is now extensively used in the United States. The development of this patent and the large-scale adaptation of the cracking process marked an era in the history of petroleum refining.

The following is a summary of an address made by Dr. Burton in May 1918, on the occasion of the presentation to him of the Wm. Gibbs medal by the American Chemical Society.

Dr. Burton pointed out that in 1910 the demand for gasoline created by automobiles began to grow so rapidly that it was obvious that something would have to be done to increase the supply of naphtha products. In those days the average yields of various products of petroleum were about as follows: naphtha products 18%, kerosene or illuminating products 30%, lubricating products 10%, loss 3%, leaving about 40% which was sold for gas-making or fuel in lieu of coal. The problem was to convert the high-boiling fractions existing in fuel and gas oil into low-boiling fractions needed by the internal-combustion engine. Dr. Burton and his associates worked for almost two years trying to devise a practical method, first by superheating and dissociation at high temperatures, but at atmospheric pressure; and, secondly, by the employment of various re-

agents, but their efforts were not successful. Having tried everything else that suggested itself these engineers decided to attack the problem from the pressure distillation standpoint. In view of the fact that distillation must take place at temperatures ranging from 350°C. to 450°C. at which the tensile strength of steel begins to diminish very rapidly, and in view of the fact that steel at such temperatures, in the presence of carbonaceous matter (and even of free carbon, which often comes as the result of pressure distillation), is likely to absorb such carbon, become crystalline and lose its tensile strength, the practical refiner doubted the success and safety of this method.

The first large still built had a charging capacity of 6,000 gal. of heavy oil. Serious leaks were encountered, but this problem was finally solved, as the oil carbonized under the influence of the high temperature and the carbon deposits stopped the leaks. There were many puzzling problems to be solved, such as the devising of a safety valve that would operate freely in spite of the intense heat and the presence of carbonaceous matter. The entire apparatus had to be constructed in such a way as to insure ease of operation and freedom from excessive repairs. The production and disposition of the so-called "fixed gases" were troublesome. It was found that in some cases the heavy oil with which the operation began evolved more gas than was needed to maintain the desired pressure, whereas other oils evolved an insufficient amount of gas for this purpose. This obstacle was converted into an aid by arranging a large number of stills in parallel so that the superfluous gases from some stills were conducted to others that needed them. The plan gave a perfect method of securing uniform pressure and control.

By starting with fuel-oil products having boiling points ranging from 200° C. to 350° C., it was possible to secure a very substantial yield of a product having boiling points ranging from 50° C. to 200° C., and it was found that losses thus incurred were trifling, averaging less than 3 per cent. It was found that the high-boiling residues thus produced yielded a product almost identical with the natural asphalt.

Developed from the single 6,000 gal. still there were then (1918), Dr. Burton stated, over 500 stills of a larger capacity. During the preceding five years more than 20,000,000 bar. of gasoline or naphtha products had been produced by these stills in the United States.

It is estimated that cracked gasoline probably accounts for about 15% of all gasoline manufactured in the United States. Casing-head gasoline, manufactured from natural gas, the development of which ranks with cracked gasoline as one of the most important refining advances, is perhaps the source of from 12% to 15 per cent.

**Natural Gas.**—The United States and Canada produce all but a small fraction of the natural gas output of the world (see 21,321). The main areas of Pennsylvania, W. Virginia and Ohio have developed remarkable staying qualities, and these three states produced virtually two-thirds of the total production of the continent. The mid-continent field has shown a great increase in the natural gas production and the Wyoming field has proved productive. There is some natural gas production in Russia, Rumania, Persia, Galicia, India, Japan and Mexico. The total production of natural gas in the United States in 1918 was 721,000,000,000 cubic feet. It is estimated that no less than 14,000,000 inhabitants of the United States are enjoying this fuel as a source of heat, light and power.

**Natural Gas Gasoline.**—Although the foundation of the natural gas gasoline industry in the United States was laid in 1903 and 1904, the real expansion of this important phase of gasoline production began in 1909. In 1911, the first year for which statistics on the subject are available, 132 plants produced 7,425,839 gal. of raw gasoline from natural gas. In 1918 the industry included 1,004 plants which produced 282,535,550 gal. of raw gasoline. Of the total, 865 were compression plants producing 219,767,207 gal. and 139 absorption plants producing 62,768,343 gallons. A canvass made in 1921 showed a total of 444 casing-head gasoline plants in Kansas, Oklahoma and northern and central Texas, having a daily output of 1,101,155 gal. of raw gasoline. Prior to 1916 the greatest proportion of gasoline production from natural gas was obtained from casing-head gas, oil-well gas or "wet" natural gas by the compression and condensation method. The development of the absorption process has extended the field of the natural gas gasoline industry to include practically all of the natural gas production in the United States, for there is but little gas production that does not contain an appreciable percentage of pentane and hexane, the hydrocarbons of the paraffin series that are the principal constituents of gasoline. Much of the so-called "wet" gas obtained from oil wells when they are first opened and from gas wells that produce no petroleum, has been sufficiently rich in gasoline vapours to warrant treatment by the absorption process, though excluded from successful treatment by compression and condensation. The following extracts are from *Handbook of Casing-head Gas*, by Henry P. Westcott:—

"Casing-head gas received its name from the casing-head on the top of the casing through which it flows. It is the gas that flows from oil wells, coming out between the casing and the tubing. The volume varies from a few hundred cubic feet to several hundred thousand cubic feet per day. Invariably the gas becomes richer in gasoline content as the wells grow older. Generally a gasoline plant or property consists of a number of oil leases grouped around a main compressor station in which the actual making of gasoline takes place. The gas lines from different wells on each lease run to a main line in which is placed a meter to measure the gasoline from that

lease. The main line runs to the compressor station or plant. There are a few plants extracting gasoline from a volume as small as 5,000 cub. ft. of gas per day, while some of the large plants are extracting gasoline from a volume of two and three million cub. ft. per day. The amount of gas necessary to make a profitable proposition is not only dependent upon the volume of gas but also on the quality of the gas. To further assist in the production, a vacuum pump or compressor is installed in the same building with the booster compressor. The object of the vacuum pump is to pump the gas from the wells and create a vacuum which materially increases the flow of the gas. Vacuum has been used in oil wells to increase the production even when gas could not be used for making gasoline.

"There are two processes for extracting gasoline. The one most commonly used is that of compression. The other is the absorption process, which is not only used with casing-head gas but also with natural gas, commonly called "lean gas," which carries as low as one-tenth of a gallon or less of gasoline per one thousand cubic feet. This process is used with gas at high as well as low pressure.

"In the compression process, the equipment consists of one or more two-stage compressors, coils, accumulating tanks, electric generator and other accessories. The casing-head gas is compressed to a pressure of from 50 to 300 pounds and then passed through a system of coils in which cold water is constantly dripping. This cools the gas, condensing the gasoline from it, the liquid being separated into respective accumulating tanks and the residue gas passing off to be used for power or heating purposes. After the gasoline is collected in the accumulating tanks, it passes into blending tanks, where it is blended with naphtha and other blending mediums to lower the gravity so as to permit of shipping without severe loss through evaporation and to make the shipping of it a safe matter.

"The absorption process is a method of passing the gas through oil and separating the gasoline vapour from it by absorption of gasoline into the oil. There are two general designs in absorption plants, one of which uses the horizontal and the other the vertical absorbers. With either system the oil is used over and over again."

Work of experimentation has been done on a process for extracting gasoline from natural gas by a method whereby natural gas is passed through absorbers containing charcoal, the gasoline absorbed by the charcoal and then distilled out.

**Marketing of Products.**—Expansion of the use of petroleum products has resulted in many improvements in marketing methods and great additions to marketing equipment and facilities. In the United States a large number of tank cars is used in transporting products from refineries to consuming centres and to ports for export shipment. The tank car is still used to some extent to carry crude oil from the field to refineries, but chiefly this is when a new field is opened up and before pipe-line connexions have been made. Tank cars are widely used in Europe for petroleum products.

There were 49,901 petroleum tank cars in the United States and Canada on Jan. 1 1914, and in 1921 the number had increased to 137,493. Rigid requirements are enforced in tank-car construction in the United States. Cars must be of steam boiler quality, and exceptional strength is prescribed for the frame. The insulated tank car to handle highly volatile casing-head gasoline has been successfully introduced and is also being adopted for transporting straight-run gasoline because it reduces loss by evaporation. The growth of motor-vehicle gasoline demand, particularly extensive and rapid in the United States, has created new distributing methods and devices. In that country and Canada gasoline filling installations for motor cars have been established in the cities and on every road of any importance. Thousands of filling stations have been built. Gasoline is delivered from tank wagons or steel barrels to the tanks built underground at the filling stations. The oil is lifted from these tanks by pumps (which measure the amount given by each stroke of the pump) and delivered through a hose into the automobile's tank. Lubricating oil at some stations is delivered in much the same way. An innovation is the visible pump at filling stations.

Fuel-oil bunkering stations have been established along the ocean routes to meet the increase in the oil-burning naval and merchant fleets of all countries. These stations include large storage tanks and berth and loading facilities in some cases, while in many instances they are simply storage reservoirs and oil is loaded on steamers from barges supplied from these stations. It is estimated that the number of fuel-oil stations for steamships located on trading routes approaches 300.

**PETROLOGY** (see 21.323).—During 1910-21 there was a steady advance in all departments of petrology, and new developments occurred which were not only interesting in themselves but gave promise of being important in the future. Up to a comparatively recent time petrology was in the main a descriptive science. The discovery of the application of the microscope to the study of very thin sections of rocks opened up a new field of investigation and showed how defective had been the means employed by the older geologists. It became possible to identify even the smallest mineral grains and to ascertain their relations to one another and the manner in which they were built together from the rock mass. For many years the description of the microscopic characters of minerals and rocks was held to be, if not the only, at least the most important, part of petrographical literature. The processes by which rocks are altered by atmospheric agencies and by underground water were revealed in detail. A great body of literature was accumulated, and a great diversity of rock types soon came to be recognized, some of them occurring in abundance in many parts of the world and others rare and exceptional either in their mineral composition or in their minute structures. Textbooks of petrography were in general a description of the recognized rock types, their composition, structure and the stages of their decay, with notes on their geographical distribution and their geological age. Chemical analyses were used principally as a means of identifying the classes to which individual rocks belonged and as a guide to the minerals of which the rocks consisted.

In time it came to be recognized that this aspect of the subject, if not unscientific, was at least incomplete. More attention of recent years has been directed to other problems connected with rocks—such especially as the conditions of their origin, their chemical classification and the physical laws which determine what minerals shall be formed, in what order they will crystallize and through what stages they will pass when subjected to cooling, pressure and metamorphism. In fact, the effect of the laws of physics and chemistry on the mineral composition and structure of rocks had become by 1921 a branch of petrology which was rapidly developing. It would be a mistake to regard this as wholly a new development, for many of the older geologists—such as Hall Gregory Watt, Daubrée, Fouqué and Lévy, Sorby, Morozewich—had carefully studied these problems and had made some notable discoveries. Essentially, however, it was necessary to attack these questions by experimental methods. The old charcoal furnace was very unsatisfactory and difficult to regulate; the gas furnace in all respects was much superior; but the advent of the electric furnace has placed in the hands of the experimentalist a weapon of enormously greater power and far more manageable. There is no difficulty now in attaining temperatures such as occur in the deeper parts of the earth's crust and in the interior of volcanoes and in maintaining these temperatures quite steady for several days or weeks if necessary. The electric pyrometer has replaced the gas thermometer and the older Seger and Wedgwood cones, and has reached such precision that an error of one or two degrees is all that need be expected in measuring temperatures up to 1600° Centigrade. By means of the electric arc, temperatures can be obtained which are beyond those which exist in the upper parts of the earth's crust, but furnaces of this type have been little used in these researches. Very high pressures can be easily obtained provided the temperature is low and there is no necessity to study the action of compressed gases. It is less easy, however, to perform experiments by which the action of steam and other gases on molten rock magmas at temperatures about 1000° and under pressures over 100 atmospheres can be exactly determined. More than one investigator has now been able to attain this, and a very correct reproduction of the conditions under which igneous rocks crystallize is consequently possible in the laboratory.

Descriptive petrology has been by no means in abeyance, though the five years of war turned the activities of many geologists to other fields. Exploring expeditions, such as those of Scott, Shackleton and Bruce in the Antarctic, have brought home large collections of rocks which have been examined and described, and the constant activities of geological surveys in all parts of the world, together with the researches of geological specialists, have added largely to our knowledge.

*Igneous Magmas.*—Of the three great groups into which rocks are naturally subdivided, the sedimentary, igneous and metamorphic, the first is on the whole best understood and presents the smallest number of unsolved difficulties. The manner in which sediments are laid down on the bottoms of seas and lakes, in river deltas and valleys and on land surfaces, at the present time is open to investigation by simple means, and, except in the case of the deposits of the deeper parts of the oceans, is reasonably clear. Igneous magmas, on the other hand, are essentially obscure in their origin and history, and they have been the subject of much investigation in recent years. The origin of magmas is a problem belonging to geology rather than petrology. They have been regarded as unconsolidated remnants of the primeval molten globe, which by geological changes, such as the secular contraction arising from cooling and the pressures by which mountain chains have been upheaved, have been afforded an outlet to the surface, where they appear as volcanoes, or have been forced between the rocks of the upper layers of the earth's crust where they may be laid bare by subsequent denudation as "bosses" of granite or gabbro or intrusive sills of porphyry or dolerite. Others have held that magmas may arise in whole or in part by the fusion of solid rocks (of any of the above three classes); the agencies producing fusion being rise of temperature, either through crushing and movement or by depression into those regions where a high temperature naturally prevails, or through penetration of gases from the earth's interior which are not only intensely hot but are capable of combining and setting free large quantities of energy. It is conceivable also that deep within the earth's crust masses of rock occur at temperatures so high that, if pressure be relieved by the vaulting-up of the overlying crust or by fissures opening to the surface, they may become liquid and rise through any available channels.

Hardly less obscure than the origin of magmas is the question of their variety or differentiation. The outstanding fact in this connexion is that no large developments of igneous rock are really homogeneous and even in small masses it is frequent to find that a great number of varieties or rock-species occur, differing in their chemical composition and their minerals. Granite, diorite, gabbro, norite and peridotite may all occur within a small outcrop not more than one or two square miles in area. The origin of differentiation has been much discussed. Some have ascribed it to diffusion or to a principle by which the heavier atoms in the molten mass will be concentrated either towards the bottom or towards the cooler edges or surfaces of contact with the surrounding rocks. Along these lines no satisfactory explanation has been found. More recent speculations have followed three lines: (a) subsidence or flotation of crystals; (b) absorption of sedimentary or other foreign rocks; (c) concentration of vapours.

(a) *Subsidence or Flotation of Crystals.*—When crystals form in a liquid they will, if heavier than the liquid, tend to subside and be collected near the base; and if lighter, they will tend to rise. If the crystals differ in composition from the liquid, as they usually do, consolidation will result in a mass which is not homogeneous. Thus, for example, olivine crystallizes early in a basic magma and, being heavy, will tend to sink; consequently magnesia and iron will be in excess (and silica will be less abundant) at the base, while feldspar will predominate towards the top of such a mass. Instances occur showing this arrangement, but they are very exceptional; it is not the case that dolerite and gabbro masses as a rule have a pale-coloured felspathic top and a dark base rich in olivine and the oxides of iron. For such cases as do occur another explanation is often available. If now it were possible at an advanced stage in crystallization to drain away or force into another position the still liquid part of the magma a type of rock different from the original magma would be produced, because most of the heavy ferromagnesian minerals would have been abstracted.

The explanation is so simple and so well justified by experiment that it is difficult to believe it has no application in the differentiation

of rock types. There is much evidence, however, that forbids us to accept it as important. For example, the study of great dolerite intrusions by means of bore shows that they are generally nearly homogeneous throughout. Top and bottom are very much the same as a rule; yet these masses must have cooled and crystallized with extreme slowness; and every chance was afforded for the accumulation of heavy crystals in their deeper parts. Again, it is the case that where many varieties of rock occur in one mass the densest are not generally in the lowest horizons. Still more important is the fact that field evidence often shows clearly that the more basic members of a complex intrusion have been injected in a liquid state into an earlier less basic mass already in position. In that case, if the more basic member was produced by the gravitational sinking of heavy crystals these must have been subsequently melted up, a process for which it is very difficult to suggest an explanation.

(b) *Absorption of Foreign Rocks.*—A second method of differentiation which has received much attention of recent years is by absorption of country rock. A gabbro mass, for example, may be supposed to dissolve a felspathic sandstone with which it is in contact and thus give rise to a more acid magma which might be represented by quartz-dolerite or even by granite. Intrusive masses of igneous rock, as they ascend from beneath, break across the overlying strata and may shatter them into many small blocks. On these and on the surrounding walls a solvent action is likely to take place. If the invaded rock is heavier than the intrusive magma its fragments will tend to sink, and as they are warmed up they will slowly disappear. There can be no doubt that this action is by no means unusual and many good instances of it are known, but there is little reason to believe that it is an important cause of differentiation. Where igneous rocks have absorbed sediment in any quantity they present in general an abnormal facies. Granites, for example, which have dissolved clay, slate or mica-schist usually contain andalusite, sillimanite, cordierite, garnet or corundum, minerals which do not normally occur in such rocks. The magmas are said to be "contaminated." Gabbros under similar conditions contain cordierite, garnet and an excess of hypersthene (forming cordierite norites) and are easily distinguished from normal gabbros. Absorption of limestone by some nepheline syenites is indicated by the presence of crystalline calcite in the igneous rock, and peridotites may contain corundum. Perhaps the diamond is an accessory of this type in olivine rocks which have dissolved graphitic matter. Even when igneous rocks are absorbed the result will as a rule be an abnormality. This is fairly evident in the majority of cases merely by a study of the analyses of true igneous rock types and ordinary sediments.

It is to be remembered, however, that a study of the crystallized igneous rocks exposed by denudation of the earth's surface reveals to us merely the last stages in their history when the upward propulsive force was spent, the fluid mass had come to rest, its temperature had fallen to such a point that crystallization had begun, part of its gases had escaped and the whole mass was encased in a solid envelope which had resulted from the rapid chilling of its external parts in contact with the cold surrounding rocks. At an earlier stage the magma was at a higher temperature and was in active movement. Constant stirring was going on and dissolved matter rapidly scattered through the whole mass. In the deeper parts of the crust the solid rocks may be mostly gneisses or old intrusive rocks different in character and in their relative abundance from the sediments of post-Archaean times, richer in alkalis and more nearly akin in composition to the igneous masses. These conditions would favour absorption and mask the consequences; and if it took place on a very large scale and time were given for diffusion a magma might be produced which would closely mimic a purely igneous magma. It has also been suggested that the absorption of foreign matter might upset the equilibrium of the original magma and give rise to partial magmas incompletely soluble in one another. It would be very difficult in such a case to determine the original nature of the rock or the amount and composition of the material dissolved.

(c) *Concentration of Vapours.*—The theory that differentiation of magmas arises from the formation of partial magmas during cooling, which separated because they became insoluble in one another (as phenol does with water), is favoured by many geologists, but a recent examination of the physical laws determining the production of such magmas has led to the conclusion that nothing is known that would make this process appear likely. Many geologists, however, who have a wide knowledge of igneous rocks in the field, hold that there is evidence to show that differentiation took place before crystallization began, and that the various types of rock were already distinct when they were injected in liquid form into the positions they now occupy.

It has been suggested, though it has not been clearly explained, that the gases dissolved in magmas determine the sequence of crystallization and may exert a powerful influence in differentiation. A magma rich in gases when it begins to crystallize yields crystals of anhydrous minerals. The gases, if they do not escape, must increase in relative amount in the liquid residuum. The early minerals are those like olivine and augite, which can be crystallized without difficulty from anhydrous melts; the later minerals, such as the alkali feldspars and quartz, crystallize readily only in presence of steam and other gases (or of solvents of a nature not usually present in rocks). In some respects the crystallization of an igneous rock

resembles the cooling and evaporation of a saline solution, the gases playing the part of solvent. The minerals appear in the order of their insolubility. It is probable that the history of magmas will never be clearly understood till a very careful study is made of the consolidation of rock-making silicates under high pressures of steam and other gases such as are known to abound in natural volcanic magmas.

**Classification of Magmas.**—The igneous rocks of one geological period and province have often so many peculiarities in common that they can be regarded as having resulted from the consolidation of a single reservoir of molten matter. The chain of volcanoes that fringes the shores of the Pacific Ocean from Tierra del Fuego to Alaska, and thence by Japan and the Philippines to Java and Sumatra, is characterized by rocks which have so much similarity in many important characters that they are certainly of allied origin, even if they have not proceeded from the one source. These rocks are all of Tertiary and recent age; their eruptions began in Eocene or Miocene time and have continued, with more or less frequent intermissions, up to the present day. For another example of this we may take the igneous rocks of the western and mid-Atlantic area, from Jan Mayen, through Iceland, the Hebrides, Canaries, Cape Verde Is., etc. All these volcanic centres have many rock types in common, and the whole assemblage is strikingly different from the Pacific igneous rocks. Each of these magmas has been taken as a type, and it has been found that in the older geological periods they are also represented; for example, the early Devonian eruptions in Scotland are distinctly of the Pacific type, while the Carboniferous eruptions in the same district are of the Atlantic type. If we seek for a precise definition of their respective characters it is not easy to give a complete answer. It may be said, however, that the Pacific suite has a great prevalence of hypersthene andesites, and andesites of all kinds. The Atlantic lavas, on the other hand, are predominantly olivine basalts, with trachytes and phonolites. Another feature which is especially striking is that practically all the rocks carrying nepheline and other feldspaths or "alkali minerals" are found in the Atlantic suites. This has been regarded as proving that the Atlantic magmas are richer in alkalis and the Pacific in lime, but it is by no means certain that this is the explanation. In fact, a full chemical discussion of the relations of these rock-series to one another has yet to be undertaken, but from the work of Becke it seems that the Pacific are essentially richer in silica, and in the "light" elements generally, while the Atlantic contain more of the "heavy" elements, such as magnesia, iron, chromium, titanium. Several authors have pointed out that the rocks of the Pacific group are associated with a folded mountain chain and consequently have appeared in a region undergoing lateral compression and upheaval; the Atlantic, on the other hand, are associated with a region of subsidence, with vertical dislocations along lines of fissure and faulting—in other words, a region subjected to lateral tension and depression. A third group of igneous rocks, very well characterized and distinct in many respects, is the pillow lavas or spilites, which are perhaps the most abundant volcanic rocks of the earlier geological periods and are very widespread in the Lake Superior district, middle Europe, Wales and Scotland. Among these lavas types rich in soda are common and albitization is a frequent pneumatolytic change. These rocks seem to accompany depressions formed in consequence of folding.

The attempt to classify volcanic magmas in groups which accompany definite types of earth movements, folding and faulting, is exceedingly fascinating. A general survey of the world's volcanics from this standpoint has been undertaken by Iddings and Stark, but the results are by no means conclusive. A great deal has yet to be done before we understand the full range of variation of many local magmas, their relation to one another and the approximate age of the intrusive types. It seems, however, that Atlantic, Pacific and spilitic suites are not in all cases sharply distinct. Harker believes, for example, that the Hebridean Tertiary magmas of Scotland are Atlantic with some Pacific affinities. He had formerly classified them as Pacific. Bailey and Clough have found in the same district a group of pillow lavas occupying a central volcanic subsidence or "caldera." In that case, accordingly, all three types occur in one narrowly cir-

cumscribed area. If so, they cannot be regarded as distinct types of magma, but rather as facies which may be developed or may appear as offshoots of a magma. Their connexion with definite types of telluric movement becomes doubtful. American petrologists also, from a study of the Tertiary magmas of the Western States, are by no means satisfied that the alkali rocks, such as phonolites, tephrites and leucitic lavas, may not belong to a definitely Pacific assemblage. In Australia, Atlantic and Pacific magmas seem to be intermixed, but in Africa Atlantic igneous rocks accompany fault-fissuring, and this extends into Arabia and Palestine. There is no doubt that on a broad scale the Atlantic and Pacific types have appeared again and again in the earth's history, and have maintained their distinctive characters. The distinction, however, is not absolute, and the rule has many exceptions. Recognition of a number of additional types has recently been proposed, and along this line it is probable that there may be considerable advance in the near future.

**Experiments on Constitution of Binary Magmas.**—A molten rock magma may be regarded as a liquid composed principally of oxides (mostly silicates). It crystallizes from a variety of causes, of which cooling is the most important, though relief of pressure and escape of gases may also play a part.

The laws followed in such a case have been very carefully investigated, not only for metals, salts and organic compounds but also for many minerals. It is generally true that a mixture of two substances will have a lower consolidation point than one of the pure substances, and, if mixed in certain proportions, they will consolidate at lower temperatures than either of the components. Thus salt and ice, if mixed in the solid state at temperatures a little below the freezing-point of water, will melt, forming a liquid which is colder than the ice originally taken; and aqueous solutions of salts have always a freezing-point lower than that of pure water. For each pair of substances there is a definite mixture which has the lowest temperature of consolidation and this is known as the *eutectic mixture*.

In the diagram (fig. 1) the horizontal coordinate represents composition, the vertical represents temperature. A mixture of any given composition is represented by a vertical line and different points in that line represent different temperatures of the mixture. The two sloping lines AE and EB divide the diagram into two regions, of which the uppermost indicates substances in a purely liquid state; below the line the substance is in part or wholly in a solid condition. A vertical (composition) line, accordingly, when it cuts these lines shows where a substance begins to crystallize. The point where the curves meet is the eutectic point E, and shows the composition of the mixture which has the lowest freezing temperature and the temperature at which it consolidates. The horizontal line drawn through the eutectic point separates the diagram into two regions, a lower one in which the substance is entirely solid and an upper one in which liquid is present. If we take any vertical line in the diagram, it will indicate a mixture of definite composition SI and, followed downwards, it shows the changes taking place in such a mixture as the temperature falls. Above the line AE the mixture is a cooling liquid. At S crystallization begins. At T the last liquid portion disappears and consolidation is complete; below T the substance is a cooling solid. The diagram refers only to substances that crystallize on solidifying; glasses are solids which essentially resemble highly viscous liquids in their properties. When crystallization begins the substance which is in excess of the eutectic mixture will crystallize out first, the residual liquid becoming poorer in that component until it has reached the eutectic composition, when the two components will go on crystallizing simultaneously till all is solid. The composition of the liquid will travel along the line AE from S to the point E, where it will remain constant.

Such a diagram is based on a series of experiments in which a known mixture of two substances (very carefully purified) is heated in a furnace (generally electric) to a temperature well above its melting-point. The mixture is then allowed to cool slowly and steadily, and its temperature recorded at short intervals or continuously by some form of pyrometer or recording thermometer. The rate of cooling can be very accurately ascertained and plotted (fig. 2). Crystallization is attended by liberation of heat (the liquid losing its latent heat as it passes into a solid), and this involves a retardation of cooling. The simple liquid cools at a uniform rate; crystallization

FIG. 1

begins and the cooling slows down; at a certain point the liquid is all crystallized and the mixture, now a solid mass of crystals, will go on cooling uniformly. The change of slope in the curve of cooling accordingly corresponds to the passage of the substance from S to E in temperature (or from the purely liquid to the purely solid areas).

The physical condition of the substance at any given temperature can also be ascertained by the method of chilling. If the charge be taken from the furnace and plunged in water (or in some cases mercury) the mixture consolidates almost immediately, and any parts which were liquid will assume the form of a glass, or a very finely crystalline aggregate. This is especially the case with silicates, many of which crystallize with difficulty. Microscopic investigation will enable us to determine the nature and relative proportions of the crystals which were present. The results obtained can be checked by experiments on mixtures having a different composition, and in this way a complete diagram built up on a sound experimental basis. The case outlined above is the simplest known. Many complications may appear, requiring special precautions and elaborate investigation. Thus the liquid may not begin to crystallize at the proper point on the upper curve, as some substances crystallize with difficulty and the liquid becomes "undercooled." A heating-up experiment may be tried to check the cooling experiments; the same phenomena should appear in the reverse order if no complications are present. Many silicates crystallize with great difficulty in ordinary crucible experiments (such as the feldspars, albite and orthoclase). Again, it may be impossible to melt the mixture we desire to investigate in any furnace which is suitable for experiments of this kind. Magnesia, alumina, and lime are examples of substances which cannot be fused at temperatures such as 1600° to 1700° C., which are the limits of accurate work in our laboratories at present; part of the diagram accordingly will be incomplete when substances like these are studied, but an approximate solution can generally be made by extrapolation. Another frequent complication is the appearance of transformations in the solid state. The first mineral to crystallize becomes unstable as the temperature falls and changes spontaneously into another crystalline form of the same substance. The change will be attended by an alteration in the slope of the cooling curve, for in such cases heat is either liberated or absorbed, and successful chilling tests can often be made by which the mineral transformation can be clearly demonstrated. Silica, for example, appears in three minerals, cristobalite, tridymite and quartz, the transition temperatures being 1470° and 870°. Each of these minerals occurs in two forms. Carbonate of lime has a high-temperature and a low-temperature form. Below 1190° calcium metasilicate crystallizes as wollastonite; above that temperature it forms another mineral, pseudo-wollastonite. Many of these "high-temperature" forms are not known as natural minerals, and as a rule they are very rare in rocks, probably because rock cooling is essentially a slow process, and the most stable forms at low temperatures are the only ones likely to be present when the mass has completely cooled. Some very interesting results have been obtained in this field of research; for example, it is known that quartz has two

FIG. 2.

modifications, one above 575°, the other below that temperature, and it has been proposed to use quartz as a geological thermometer to show at what temperature it crystallized in a rock mass. If above 575° it would appear as quartz and on cooling would pass into  $\alpha$ -quartz; and by various indications, such as crystalline form, cracks, etc., a record of this transformation may be obtained.

Very interesting modifications of the process of crystallization occur when two or more of the minerals formed are members of an isomorphous series and can in consequence form mixed crystals. This is very common among the minerals of igneous rocks, of which the feldspars, pyroxenes, olivine (and probably also hornblende, mica, nepheline and the feldspathoids) all belong to isomorphous series. If we have, for example, two components such as albite and anorthite, they will tend to form mixed crystals (known generally as plagioclase feldspars). Anorthite has the higher melting-point (about 1550° C.); albite crystallizes in crucibles only with great reluctance at a temperature about 1100° C. A mixture containing equal proportions of anorthite and albite will melt at about 1450°, and on cooling will begin to form crystals at that temperature.

These crystals will contain about 60% anorthite—that is to say, they are enriched in the less fusible component. As crystallization proceeds, the feldspar that separates becomes gradually less rich in anorthite. The composition of the liquid also alters, because the crystallization is abstracting anorthite molecules more rapidly than albite molecules. This process may go on till the feldspar has all crystallized, the last deposited being near albite in composition, and the crystals, examined microscopically, will show zones, of which the internal are rich in anorthite and the external are progressively richer and richer in albite. But if sufficient time is allowed, a reaction sets in between the crystals and the liquid; in other words, the feldspars crystallized are not in equilibrium with the magma except at the moment of crystallization, and as the magma becomes richer in albite it will attack the early plagioclase, replacing it by a variety containing more albite. These phenomena are well known to petrologists as zonal structure of plagioclase feldspars; and corrosion of the cores and internal zones of the crystals is almost universal in such rocks as basalt and andesite. Rocks of similar composition which have cooled very slowly, such as gabbro and norite, as a rule do not contain zoned plagioclase crystals, no doubt because equilibrium has been attained and homogeneous crystals formed by the process above described.

FIG. 3.

This may be illustrated by fig. 3. The horizontal line represents composition, the vertical temperature. A is 100% albite, B is 100% anorthite. The upper curve is the liquidus above which there is only liquid; the lower is the solidus below which all is crystallized; between these lines is a space representing stages in which crystallization is going on but still incomplete. Each point on the solidus has a corresponding point on the liquidus, which is found by drawing a horizontal line across the intervening space. A mixture of any composition, say  $a$  at  $ab$ , is completely liquid. As the temperature falls it begins to crystallize at  $b$ . The crystals formed have the composition  $c$ . Further cooling results in the formation of crystals at  $b'$  the composition being  $c'$ . At  $b''$  all is crystallized, the last crystals being  $d$ . If resorption is completely accomplished the final crystals have the composition  $x$ , but they are usually more rich in albite; this will depend on the rate of cooling, the number and size of the crystals formed, and on a variety of other factors.

The theoretical investigations of Roozeboom and Gibbs have shown that five types of crystallization of isomorphous substances may occur, in some of which the mutual solubility of the two components is unlimited, while in others it is limited so that only mixed crystals of certain types may occur. Several of these have been identified in rock-forming minerals, and others are suspected though not yet proved.

**Ternary Magmas.**—Magmas of three components (ternary) are much more complicated than binary magmas. To represent their behaviour a triangular diagram is necessary. Usually an equilateral triangle is employed and the distance from any point to the three sides of the triangle is made to represent the three components of any mixture in their true proportions; the sum of these three perpendiculars is constant and equal to the height of the triangle; if lines be drawn through the point, parallel to the sides of the triangle, they will cut the sides at distances which will represent the relative proportions of the components. Any mixture of three components can be represented by one point in this triangle. To represent temperature another coordinate is required which is perpendicular to the plane of the triangular diagram; and a solid model must be made, resembling a triangular prism with flat base and an irregular surface representing the consolidation temperatures as the top of the prism. Each of the three vertical surfaces of the prism represents the behaviour of the mixture of two of the components.

To enable us to construct such a model a very large number of experiments must be made, first with binary mixtures and then with mixtures of the three substances. Their exact temperature of first crystallization must be ascertained in each case and also the nature of the mineral which crystallizes. Simultaneous crystallization of two minerals will follow, and the temperature at which the second mineral appears is to be determined. Three minerals will ultimately

appear, and the last process will probably be the formation of a ternary eutectic at which the temperature remains steady till the liquid disappears and finally the completely solid mass cools down.

As a very simple case we may take the diagram in fig. 4. A, B and C represent the three pure substances. AB, BC and AC represent mixtures of two components.  $E_{ac}$ ,  $E_{bc}$  and  $E_{ab}$  represent the three binary eutectic mixtures. The ternary eutectic is represented by  $E_{abc}$  containing about equal quantities of C and B and a smaller amount of A. If  $a$  represent the composition of a certain liquid which is allowed to cool and crystallize, composition will change along the line  $Aa$ . At a certain point the A component will crystallize out and the liquid will become poorer in A (richer in B and C), and the composition will change from  $a$  towards  $b$  (away from point A). After a time the liquid becomes saturated for  $b$  which will start to crystallize, and now the liquid changes composition along the line  $bE_{abc}$  as the temperature continues to fall; finally C also begins to crystallize, and the ternary eutectic point is reached at which the three components crystallize simultaneously in definite proportions (represented by the position of  $E_{abc}$ ) until it is completely solidified.

It is probable that nothing quite so simple as this occurs in ordinary rock-forming minerals, at least the silicates, but some metallic alloys show this type. In considering silicates the following considerations must be kept in mind: (a) The liability to form compounds, which behave as new substances with their own fusion-points and eutectics. (b) The occurrence of isomorphous compounds is almost universal and these form mixed crystals unstable in the changing magma, and liable to resorption (this may upset the formation of a ternary eutectic altogether). (c) Compounds may appear at an early stage which subsequently become unstable and are replaced by different minerals (incongruent). (d) Many silicates refuse to crystallize in ordinary crucible experiments (except in presence of solvents which do not appear in the final product).

We must also keep in mind that in the crystallization of rocks certain conditions prevail which may modify the process to an unknown extent. Thus: (a) All magmas contain gases, of various kinds which may have a very powerful influence in determining what minerals will form. (b) Intrusive magmas are under great pressure and the pressure diminishes as they rise to the surface; the pressure may act directly or by increasing the concentration of the gases dissolved in the magma. (c) Cooling in deep-seated magmas is extremely slow. This will tend to prevent supersaturation by undercooling and lessen the chance of the abnormality in the

As an example of the effect of isomorphous minerals on the sequence of crystallization we may take a mixture consisting of 50% diopside and 50% plagioclase (containing equal proportions of albite and anorthite). The composition diagram (fig. 5) is a triangle with each mineral at one of the corners and the mixture is represented by a point (F). Crystallization begins with a separation of diopside (supposed to be a simple mineral and not an isomorphous mixture, as it would usually be in rocks) at about 1275°. At 1245° the excess of diopside (G) has separated out, and feldspar begins to crystallize. It has about 75% anorthite (H). Thereafter diopside and feldspar both crystallize, but as the temperature travels along the line EGD from G to K the composition of the feldspar changes from H to L (if we suppose that all the early feldspar which is unduly rich in anorthite is stage by stage absorbed). The resulting rock has the mineral composition above stated; but if resorption of feldspar is incomplete the last-formed feldspar is richer in albite and has a composition T. The feldspar crystals in that case are zonal with basic centres. If at any time crystallization is suddenly brought to an end, a glassy ground-mass will be formed, which is richer in soda and silica than the original magma and contains zoned feldspar crystals. This is exceedingly like what takes place in many basaltic lavas. Again, if the original mixture had been richer in feldspar, so that the composition point lay below the line DE, feldspar would have crystallized out first. This seems to be in keeping with the structure of many dolerites, which contain feldspar partly enclosed in augite

FIG. 4.

FIG. 6.

crystals of later formation (ophitic structure), while others show that the augite appears in porphyritic crystals and began crystallizing before feldspar. Another interesting feature of this diagram is that there is no ternary eutectic point, and the liquid residue continually changes in composition up to its final disappearance.

The phenomena of these component systems are extraordinarily varied. One of the best known is the system  $Al_2O_3$ - $CaO$ - $SiO_2$  which has been very fully tested at the Geophysical Laboratory in Washington by Shepherd and Rankin. A copy of their diagram is given here (fig. 6). It is divided into fields, of which six are occupied by substances known to occur as minerals, cristobalite, tridymite, wollastonite, anorthite, sillimanite and corundum. In each of these fields the mineral named will crystallize if the temperature of the melt falls. The fields are separated by lines which show under what circumstances the two minerals whose fields adjoin will crystallize. Where three fields meet, the conditions exist at which three minerals will exist simultaneously (or, to express it otherwise, are in equilibrium with a liquid of the composition indicated). In no case do four fields meet in one point.

This system is also of much interest to technologists desiring to understand the chemistry of the manufacture of Portland cement. This is a mixture of lime, alumina and silica, with a fairly definite composition, and the compounds which form on fusing or sintering the mixture are indicated by the diagram. Similarly, the  $CaO$  corner of the figure shows what is the result of heating lime containing a little alumina and silica (impure limestone) to a very high temperature. Silica is also a refractory mineral and is used in silica-bricks and ganisters for lining furnaces. A little lime and alumina are mixed with it (either naturally or expressly to obtain certain results), and the behaviour of such mixtures is indicated by the appropriate corner of the ternary scheme. These investigations accordingly are of the greatest value in many industries such as pottery, steel-making, glass-melting, brick-making, cement manufacture, lime-burning and the quartz-glass industry. During the war the Carnegie Geophysical Institute at Washington, which has earned great fame

FIG. 5.

sequence of crystallization which may appear in rapidly cooled melts. It will also favour the complete transformation of early unstable minerals into stable permanent forms. Many varieties of minerals have already been obtained experimentally which are not known to occur in rocks. They are stable only at high temperatures (and possibly under low pressures).

for these researches, was able to direct the manufacture of chemical and optical glasses in the United States in a most successful manner, and performed very valuable services to American industry.

**Theory of Ternary Mixtures.**—The theory of ternary mixtures has been very fully worked out mathematically by Willard Gibbs, Backhuys Roozeboom, Schreinemakers, Smits, Kuene, Tammann and others, and may be said to be well understood in its main applications. Experimental investigation has also made great progress. It is a laborious matter, requiring great skill and very elaborate appliances. The diagram we have given showing the tertiary system  $\text{CaO}-\text{Al}_2\text{O}_3-\text{SiO}_2$  required over 7,000 experiments, in some of which the heating had to be continued for many hours and even for days; and the thermal results had usually to be checked by microscopic examination of the product. Other systems equally important have received very careful study. These are not so simple as the instance quoted, because mineral transformations, either during or after crystallization of the melts, often give rise to many complications. Thus, for example,  $\text{CaSiO}_3$  crystallizes as pseudo-wollastonite at high temperatures, which may change to wollastonite at low temperatures.  $\text{MgSiO}_3$  has four forms—kupferite, magnesia amphibole, enstatite and clinoenstatite. Where both these substances separate from the melt, none of the above-named minerals appears, but a diopside clinoenstatite solid solution or isomorphous mixture, which belongs to the common group of minerals known as the pyroxenes.

These facts are of the greatest interest to both mineralogists and petrologists. They have introduced many new minerals (artificial) to our knowledge, and taught us their relationships at atmospheric pressures in certain dry melts. They have also enabled us to understand many of the peculiarities of the minerals that occur in rocks, and the method of their origin.

As another instance we may quote the relations of forsterite ( $\text{Mg}_2\text{SiO}_4$ ) and rustalite ( $\text{MgSiO}_3$ ). Forsterite may crystallize from melts of suitable composition and after a time it may become unstable in the residual magma; then it is dissolved up or "corroded" and clinoenstatite replaces it. Again, if an enstatite ( $\text{MgSiO}_3$ ) mixture be fused and allowed to cool, forsterite begins to separate out; it will tend to be reabsorbed and converted at a lower temperature to clinoenstatite, but if this be prevented the mixture solidifies as forsterite, clinoenstatite and quartz. To the petrologist this is of great interest, because forsterite is one of the constituents of olivine, a very common mineral of the basic igneous rocks. Now olivine generally occurs along with some member of the pyroxene group, and the olivine crystals show rounded outlines, which have been taken to indicate corrosion or resorption by the magma after crystallization with concurrent formation of pyroxene. In some rocks there is clear evidence that olivine crystallized early and subsequently was entirely dissolved. In other rocks olivine is found enveloped in clusters of enstatite crystals which have evidently formed at its expense; and it is a very frequent characteristic of the olivine of gabbro and norite that they are surrounded by "reaction rims" or "corrosion borders" consisting of enstatite, tremolite and other magnesium silicates that have a higher percentage of silica than olivine itself. The meaning of these phenomena was fairly well apprehended by petrologists, and now their conclusions have been confirmed by experimental evidence. Another feature of some interest is that, in the ternary system under consideration, it has been shown that forsterite may crystallize early, then disappear by corrosion, and a second generation of forsterite may subsequently crystallize. Whether this is a common phenomenon is not yet known, and its exact relation to the frequent appearance of minerals in two generations in rocks remains to be demonstrated.

The number of ternary systems that have as yet been fully investigated is small, though the results are of the highest importance. Those which contain the alkalis potash and soda present certain special difficulties, such as the volatility of part of the mixtures and the difficulty of crystallizing some of the minerals. Rapid progress is being made and it is unlikely that experimental difficulties will retard the advance of knowledge. A special case, of the greatest possible interest to the petrologist, arises where one or more of the components are volatile. Natural magmas are probably always richly charged with gases. The theory of such systems has been explored by Schreinemakers, Smits and others. Experiments with mixtures enclosed in steel bombs which can withstand great pressures at high temperatures have been very successful in certain cases, but as yet only the borders of this field have been explored. A good deal of work has been done on the dissociation pressure of sulphides of the metals, a subject of great importance as regards the paragenesis of natural sulphides and the conditions under which mineral veins have been formed. The effect of steam in the formation of silicates is under investigation and during the next few years will probably be the subject of much research.

**Quaternary Mixtures.**—We have seen that systems of three components are much more complicated than systems of two components; and the addition of a fourth component greatly increases the difficulties. The theory of such systems is not as yet fully explored; in fact, it is quite probable that many of the problems will not be solvable by mathematics. No four-component system has yet been completely studied, though parts of such systems have received investigation. As a diagram a solid figure bounded by three equilateral triangles may be used, and projections similar to those

employed to represent the faces of crystals have been tried. Systems more complicated than the quaternary systems are at present beyond mathematical and experimental investigation.

**Constitution of Rocks.**—In rocks the least number of components that can be regarded as essential is seven ( $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{MgO}$ ,  $\text{K}_2\text{O}$  and  $\text{Na}_2\text{O}$ ). In rock analyses as a rule from 12 to 20 components are ascertained, but most of these are in small amount and may be regarded as unessential. To the seven main components we must add the volcanic gases (such as  $\text{H}_2\text{O}$ ,  $\text{F}$ ,  $\text{Cl}$ ,  $\text{HCl}$ ,  $\text{SO}_2$ ,  $\text{B}_2\text{O}_3$ ), most of which appear only in very small quantity in the crystallized rock, but are believed to exert a powerful influence in determining the crystalline phases that appear. High pressures must also be employed, and in some cases it is certain that the pressures were by no means constant. For these and other reasons it is clear that the genesis of such a rock as granite or basalt presents problems of the highest order of difficulty.

In the preliminary stages it may be possible to simplify the problem by considering rock magmas, not as a mixture of the seven oxides above named, but as mixtures of minerals. If three minerals be taken a ternary system is the result. For example, a granite might be regarded as consisting of orthoclase, quartz and albite; a nepheline syenite as consisting of nepheline, albite and aegirine; a basalt as composed of olivine, diopside, anorthite. Such systems, of course, are a mere approximation and it is already known that it may not be safe to treat them as simply ternary. In the system diopside-forsterite-silica, for example, it is proved that under certain conditions spinel crystallizes, and the reactions can only be regarded as those of a four-component mixture. Another difficulty that is bound to prove important is the occurrence of isomorphous minerals. In petrology this is practically universal. Except quartz, all the common rock-forming minerals are members of complicated isomorphous groups (felspars, nepheline, sodalite, micas, pyroxenes, amphiboles, olivines); and even in simple ternary systems, if two of the three minerals are isomorphous, there may be, strictly speaking, no eutectic mixture as the last stage of crystallization. It is not too much to say that the crystallization of rocks is very largely a problem of the formation of isomorphous crystals, and it is unsafe to apply to rocks the results derived from mixtures of minerals that do not show similar relations.

**BIBLIOGRAPHY.**—For the recent advances in physico-chemical and experimental petrology no English textbook is available. Harker's *Natural History of Igneous Rocks* (1909) gives a sketch of the subject from the standpoint of its time, but is now out of date. A more adequate work is Boeke's *Physikalisch-Chemische Petrographie* (1915), which gives full references and is the best general account. Vogt's *Silikat-Schmelzungen* (1904) is interesting but very speculative. His *Sulphid-Silikat-Schmelzungen* (in course of publication) deals with some special aspects of the problem. The fundamental works on the theory of equilibrium are Roozeboom's *Heterogene Gleichgewichte* and its continuation (3rd vol.) by Schreinemakers. See also Bancroft, *The Phase Rule*, and Findlay, *The Phase Rule*; Tammann, *Krystallisieren und Schmelzen*. For English and American students the best authorities are the papers published by the workers of the Geophysical Institution in Washington. See also Niggli, *Lehrbuch der Mineralogie* (1920), *Die Leichtflüchtigen Bestandtheile im Magma* (1920); Daly, *Igneous Rocks and their Origin* (1914); Iddings, *Igneous Rocks* (1913); Holmes, *Nomenclature of Petrology* (1920); Stark, "Petrographische Provinzen" (in *Fortschritte der Mineralogie*, 1914). (J. S. F.)

**PFLANZER-BALTIN, KARL, FREIHERR VON** (1855– ), Austro-Hungarian general, was born at Pécs in Hungary in 1855. He served in the cavalry and on the general staff, but in 1914 found himself, on account of precarious health, unattached, and it was only in the autumn of that year, when Rumania appeared to be turning against the Central Powers, that he was charged with the defence of Transylvania. But when the Russians at this period crossed the Carpathians, and there was immediate danger of their eruption into the plains of Hungary, Pflanzer-Baltin, with a division improvised by his brilliant talent for organization out of next to nothing, threw himself on this enemy, and conducted the defensive in the form of a series of daring offensive movements. After fighting with varying success in the southern part of Eastern Galicia and in the Bukovina the VII. Army under his command was driven back by Brussilov's offensive in June 1916, whereupon he was relieved of his command. In the summer of 1918 the Austro-Hungarian front in Albania yielded before the attack of the Entente army. Pflanzer-Baltin, entrusted with the command in this theatre of operations, won back, after a brief and powerful attack, the old positions southwards of Fjeri and Berat—the last considerable success which fell to the Austro-Hungarian army in the field. (A.-K.)

**PHARMACOLOGY** (see 21.347).—The science of experimental pharmacology is a product chiefly of the last half-century, and

the subject has more recently made rapid advances, due largely to the creation of new laboratories and the institution of new chairs devoted to pharmacological research. The chief importance of the work lies in the application of the knowledge gained of the physiological action of drugs to the treatment of disease in man and animals; and, though there have been periods when this branch of therapy—in spite of its antiquity and persistence—has been subject, recent research leading to new, more accurate, and more scientific use of drugs has placed the subject in a position so indubitable that the time is not in sight when the practice of medicine or surgery will be able to dispense with its services.

The main directions of recent advances in knowledge may be indicated. The action of familiar drugs becomes daily more accurately known, leading to a juster estimate of their value and greater precision in the use of them in disease. New remedies are being introduced and older remedies superseded. The enormous development of synthetic chemistry has furnished many potential remedies, all of which are now subjected to pharmacological investigation before they are used on man. One relatively recent development which has proved fruitful in results of great practical importance in the treatment of disease is that of experimental therapeutics, where the cure of disease artificially produced in experimental animals is investigated. So far this has been most successful in the case of experimental trypanosomiasis, largely owing to the ease with which a disease of this nature can be induced in laboratory animals and the constancy and certainty of its duration.

Here only such developments of pharmacology need be mentioned as have already passed from the by-way of mere academic interest into the highroad of practical application.

Of the simpler saline compounds the familiar Epsom salts—magnesium sulphate—has been found to have more interesting actions than that for which it is generally used. When given as a purgative very little of it is absorbed into the blood, owing to the difficulty which both magnesium and sulphate ions experience in passing through membranes like the lining of the gut. But if injected hypodermically or intravenously in sufficient quantity it has a powerful action on the nervous system, causing a kind of motor paralysis and anaesthesia. This effect of magnesium—for the sulphate ion takes no part in it—has been utilized in the treatment of tetanus, in which condition magnesium salts have been injected intraspinally, with benefit in many cases in so far as the relief of symptoms is concerned. This depressant action of magnesium on the nervous system is antagonized in a dramatic way by calcium salts; an animal paralysed by magnesium being restored, in suitable cases, to a normal condition in a few seconds by intravenous injection of a soluble calcium salt.

Of the heavy metals arsenic and antimony have in recent years claimed most attention. Both arsenic and antimony have been used empirically in the treatment of syphilis for over a century but without having any great vogue. When it was discovered that organisms of the trypanosome type are the cause of syphilis and of many tropical diseases, and that arsenic is a powerful poison for such organisms, an experimental justification for the employment of this substance in the treatment of syphilis was furnished. The drawback to its use was that it is so poisonous to higher animals that it is difficult to get into the blood a concentration of arsenic sufficient to kill the parasitic organisms there present without injuring the host. It was found, however, that certain organic compounds of arsenic could be made which were very much less poisonous for mammals though their toxicity for trypanosomes was retained or enhanced. Pursuing this line of investigation of a large number of arsenical compounds Ehrlich eventually discovered and recommended, as a result of animal experiments, salvarsan as a remedy for syphilis. The value of salvarsan and of nearly related compounds in the treatment of syphilis is now common knowledge. One interesting point in regard to this is that those unicellular organisms of that type which causes syphilis readily become immune to the action of arsenic. It is therefore possible that, with the almost universal use of salvarsan nowadays, strains of syphilitic infection may be developed which are immune to arsenic; and for people infected with syphilis from these sources arsenical compounds like salvarsan would no longer have any remedial value. The risk of this unfortunate sequel is small because usually salvarsan treatment renders the patient no longer liable to infect other people and only in this way could an "arsenic-fast" infecting organism be produced, but the risk would seem to be not negligible. Fortunately no such immunity to mercury occurs.

The fact that antimony belongs to the same chemical group as arsenic suggested the possibility that it, too, might be valuable in these diseases and pharmacological investigation showed that antimony has for trypanosomes a toxicity superior even to that of arsenic. Though no organic compound of antimony has been dis-

covered comparable in advantageous properties with the salvarsan compound of arsenic, the familiar tartar emetic (potassium-tartrate of antimony) has been found, when administered intravenously, adequate for the treatment of two important diseases, Kala-Azar and Bilharzia—diseases due to organisms different from trypanosomes and for which no other effective remedy is known. These discoveries have led to a revival of the use of antimony in medicine; in the 17th and 18th centuries especially, antimony was regarded almost as a panacea, but later it lost a prestige which it is now regaining.

One of the established pharmacological actions of lead is to stimulate involuntary muscle of every kind, as exemplified in cases of industrial poisoning by the occurrence of colic caused by irregular and spasmodic contraction of the muscle of the bowel. While lead-poisoning tends to become less common, owing to trade precautions and earlier recognition of it, stress has been laid on the frequency with which lead is used, especially in industrial districts in the N. of England, to procure criminal abortion, which it tends to do—though only in poisonous quantities—by the irritant action of lead on the muscle of the uterus. For this purpose lead plaster, which is easily procurable by the laity, is frequently used by ingestion.

Of the simpler derivatives of benzol, carbolic acid itself, which was first employed by Lister as an antiseptic now over half a century ago, has gone largely out of use, especially as a surgical antiseptic, though certain closely related compounds have important antiseptic uses. Thus benzoic acid and benzoates are very widely used as antiseptics in preserved foods and are, so far as careful experiments have shown, harmless in the quantities used for this purpose. Salicylic acid has come to be a favourite antiseptic for many infective skin diseases.

The group of antipyretic derivatives of benzol continue to be widely employed not so much for reducing febrile temperatures as for their action in relieving pain, which they effect by a paralyzing action on that part of the brain which is responsible for the perception of pain. A large number of new compounds of this type have been investigated but so far only one of them threatens to usurp the supremacy of the older phenacetin and antipyrine, namely aspirin. Aspirin is a compound of salicylic acid and acetic acid. Salicylic acid and its compounds have a very important, and partly specific, effect in rheumatic fever in which they relieve the pain and reduce the temperature; but aspirin is more effective in relieving non-rheumatic pain such as headache. It is a relatively harmless drug; but occasionally alarming, if not serious, symptoms are produced by it in people specially susceptible to its action, the most frequent symptom being oedematous swelling of the face, which, however, disappears when the drug is discontinued.

Though much new work has been done on the effect of moderate doses of alcohol, little has been added which was beyond the shrewd suspicion of those who have intelligently experienced its effects throughout the ages. That it has killed more than it has cured is more than probable; that, if the imperfection of human nature persists, alcohol, if it is banished, will be replaced by something worse is not unlikely. Numerous new artificial hypnotics have been investigated, of which veronal, legitimately used, has proved safe and efficient. Unfortunately cases of veronal habit have become increasingly frequent, and deaths from overdosage, of which the lay papers have afforded numerous examples in recent years, must have served to warn the general public of its dangers.

Of the general anaesthetic ethers has steadily gained in favour for routine purposes. To get rid of its irritant action on the lungs and bronchi, it has been administered in limited cases intravenously and by rectal injection, but experiments are in progress which may result in the discovery of an anaesthetic ether deprived even of the slight drawbacks which at present attach to it.

With regard to the great group of alkaloids, much light has been thrown in recent years both on their chemical constitution and their exact pharmacological actions, and no apology need be made for taking the alkaloids of opium first. These can be divided chemically into two groups, of which morphine is representative of the one and papaverine of the other. The two groups differ considerably in their actions, as might be expected. The papaverine group has a much more pronounced action than the morphine group in relieving spasmodic contraction of smooth muscle—a pharmacological explanation of the clinically observed fact that preparations of opium, which contain a mixture of the alkaloids, are better for relieving colic, for example, than pure morphine. Preparations like tincture of opium have long been used for the relief of pain by external application, in spite of the fact that pharmacological evidence was against its having any action on the sensory nerve ends, but more recent and exact research has shown that some of the alkaloids have a distinct local anaesthetic action, apart from the effect they have in relieving pain by an action on the central nervous system.

The stimulant action of caffeine on the higher functions of the brain is recognized in the world-wide practice of consuming beverages, such as tea and coffee, which owe their stimulant action to the caffeine that they contain. But caffeine also stimulates the kidney and causes an increased flow of urine. Caffeine is chemically a trimethyl-xanthine and two closely allied compounds, theobromine and theophylline—dimethyl-xanthines—are more powerful diuretics while having less effect on the central nervous system. They are used, in preference to caffeine, where diuretic action alone is desired.

Cocaine is another alkaloid which was discovered as the result of the use by natives of S. America of the leaves of the coca plant as a stimulant. The active ingredient of these leaves is the alkaloid cocaine, which was found to be a powerful local anaesthetic and which rapidly displaced from use the older and less efficient remedies for the prevention of local pain. But the stimulant action of cocaine on the brain has not been overlooked by civilized races; and the habit, insidious and disastrous, of indulging in cocaine as a stimulant has become a serious problem especially in America and in France and has necessitated restrictive legislation upon the sale of the drug in most countries. This is only one of the many drugs used as a stimulant-intoxicant, others being morphine and its derivatives and the various hypnotics. When drugs having this narcotic action are taken for a very few times the person rapidly develops a craving for them. If the practice is continued, larger and larger doses have to be taken to produce the same effect, and in no long period a habit is developed, always difficult and sometimes impossible to break off.

One disadvantage of cocaine as a local anaesthetic—for example in dentistry—is that it is a very poisonous substance if absorbed into the general bloodstream in sufficient quantity and with sufficient rapidity. This danger can be prevented to a large extent, as is now the general practice, by injecting with it adrenaline which causes such a powerful contraction of the blood-vessels in the region of the injection that the cocaine is absorbed very slowly; and, as it is being excreted continuously, the risk of a dangerously high concentration occurring in the blood is minimised. Artificial compounds resembling cocaine have been manufactured which are equally good local anaesthetics but are less generally poisonous. Such local anaesthetics act by blocking the passage of impulses through the nerves, so that painful sensations can no longer pass through the affected nerve. A similar effect can be produced on the spinal cord if the anaesthetic is injected so as to come into immediate contact with it. By this method of "intra-spinal anaesthesia" the whole of the lower limbs and of the lower part of the body can be rendered insensitive to pain, because conduction of pain sensations from this region to the receiving station (the brain) is blocked at the site of injection.

The plant belladonna is said to have been so named because it was used in by-gone days by ladies fair for the sinister purpose of dilating their pupils to enhance their charms. The chief active principle of belladonna—atropine—is still in daily use for dilating the pupil, usually under more prosaic circumstances. This effect is only one example of a general action of atropine in paralysing all parasympathetic nerve terminations throughout the body. Other closely allied alkaloids found in other plants of the order *Atropaceae* have a similar action. One such alkaloid, hyoscyne, also called scopolamine, differs from atropine in its action on the central nervous system, having a depressant in place of a stimulant action, and hyoscyne is now in common use as a hypnotic for certain conditions. In combination with morphine, it is used to produce general analgesia, with temporary loss of memory, in the treatment of child-birth, for which the romantic name of "twilight sleep" has come into vogue.

Hyoscyne contains an asymmetric carbon atom and laevo-rotatory hyoscyne is much more active than the dextro-rotatory form. This difference—a superior activity of the laevo-compound—has been found also in the case of other optical isomers, e.g. of adrenaline and hyoscyamine, and seems to be very generally true.

Ipecacuanha has been used as a remedy for dysentery with varying success for nearly three centuries. It is now known for certain that it is curative only in one form of dysentery, that due to an amoeboid parasite; and also that the curative effect is due to the fact that the alkaloid emetine found in ipecacuanha is, though possibly only indirectly, a specific poison for this parasite. Emetine is now given hypodermically in amoeboid dysentery and an artificial compound of it—emetine bismuth iodide—has been found superior to it in the treatment of chronic dysentery.

Consequent upon the advances in knowledge of the physiology and pathology of the heart, the cardiac tonics of which digitalis is the chief have been investigated more fully, and a considerable part of the advantageous action of digitalis in heart disease, especially in auricular fibrillation, is found to be due to its impairing the conduction from the auricle to the ventricle.

Drugs which cause the muscle of the uterus to contract are of great value in certain cases of labour, especially for preventing uterine haemorrhage. The extract of pituitary gland, which powerfully stimulates the contractions of the uterus, has now largely replaced the preparations of ergot so long used in midwifery practice for this purpose. The active principles of ergot itself have at last been determined and two of them found to be amines—tyramine and histamine—derivatives of the aminoacids tyrosine and histidine respectively. The discovery of the wide incidence of such amines, of their physiological action and of their chemical relation to adrenaline, has formed one of the most brilliant and fruitful chapters in modern biological research and has tended to bring into closer relation and coöperation the subjects of physiology, pharmacology and pathology. (J. A. G. \*)

**PHILADELPHIA** (see 21,367), retaining its rank as third city in the United States, had in 1920 a pop. of 1,823,779, an increase of 274,681 or 17.7% over the 1,549,098 of 1910. The pop.

of 1920 comprised whites, 1,688,313; negroes, 134,098, and Chinese, Japanese and Indians, 1,368. The increase in the white pop. since 1910 was 224,942 or 15.4%, while the corresponding increase in the negro pop. was 49,639 or 58.8%. In 1920 males were 908,067, or 49.8%, and females 915,712, or 50.2%.

**Government and Finance.**—The Bullitt Act, under which the city government had functioned since 1887, gave way in 1920 to the Woodward Act, which became effective with the beginning of the term of Mayor J. Hampton Moore, in Jan. 1920. The new charter differs greatly from its predecessor. Under it a dual council is succeeded by a single body composed of one member for each 20,000 assessed voters in each state senatorial district, the membership in 1920 being twenty-one. The councilmen serve for four years, and receive a salary of \$5,000. In the executive department, the department of supplies is superseded by a purchasing agent, and the department of health and public charities is separated into two with a director for each, the title "Public Charities" giving way to "Public Welfare." Further provisions enable the city to do its own street cleaning and garbage and ash removal, and place the great majority of city employees under civil service rules. By this provision not only small office-holders but the police and fire departments are removed from the possibilities of political activity.

The cost of city operations has grown steadily since 1911, when, under provisions of the state school code of May 18 1911, the Board of Education was separated from the city government. The combined cost in 1911 was \$33,846,875.91. With the school expenses eliminated the cost in 1912 of city government was \$30,213,067.44; and, barring a slight decrease in 1913, has grown steadily until it reached \$48,520,872.92 in 1919. The tax rate, with the school tax transferred to a separate item, was \$1 in 1912, \$1.25 in 1917, \$1.75 in 1918 and \$2.15 in 1920. This rate applied to real estate valued in 1919 at \$1,805,494,000. At the close of 1919, the gross funded outstanding debt of the city was \$173,473,450, of which the commissioners of the sinking fund held \$31,898,400, leaving a net funded debt outstanding of \$141,575,050.

**Commerce and Industry.**—As a distinctive manufacturing centre, Philadelphia shared the general depression of 1914, but advanced rapidly with the increasing European demand after the outbreak of the World War.

This is shown in the following table of the export values of the port of Philadelphia from 1910-20:—

Exports		Exports	
1910	\$65,256,949	1916	\$321,044,815
1911	70,869,648	1917	501,234,069
1912	72,769,617	1918	427,244,212
1913	72,236,967	1919	522,391,091
1914	66,256,811	1920	451,943,216
1915	132,437,556		

Importation figures also show a remarkable increase in the decade. The imports in 1910 were valued at \$89,610,401; in 1915, \$69,473,983; and in 1920, \$282,157,831. In 1910, 9,871,667 gross tons of shipping arrived and 9,771,266 tons cleared; in 1915, 9,315,157 tons arrived and 9,377,901 cleared; and in 1920, 12,246,427 tons arrived and 12,820,377 cleared. The following table of coal exportation shows the increasing value of the product as compared with tonnage shipped:—

Coal exported in tons		Value
1910	866,148	\$2,505,745
1915	1,127,415	3,445,543
1919	1,072,773	6,434,581

This remarkable increase in the activities of the port was made possible by the completion of large parts of the 35-ft. channel from Allegheny Ave., Philadelphia, to the sea. The channel, about 800 ft. wide throughout, was 56% completed on Dec. 31 1920 (the remaining sections having a depth of 30 ft.), while a similar channel in the Schuylkill river, from Passyunk Ave. Bridge to the Delaware, was 65% completed. Both channels are national operations, authorized by Congressional action and carried on with biennial appropriations. The completion of more than half of the main channel opened the port to shipping of a heavier tonnage and the result was manifest in the increased number of lines plying from Philadelphia. In 1914 there were 27 transatlantic and 5 coastal lines; in 1918, at the close of the World War, 36 transatlantic and 4 coastal; and in April 1921, 49 transatlantic and 10 coastal lines. A survey of the Pennsylvania department of internal affairs shows that Philadelphia in 1919 had 4,454 manufacturing establishments, with 297,436 employees, and products of \$1,951,998,000. The capital invested was \$1,005,658,500. Metals and metal products were first with 946 establishments, 66,991 employees, and products of \$366,780,000. Textile factories

numbered 502, with 44,294 employees and products of \$292,107,000. The values of other products were: food and kindred lines, \$283,531,000; chemicals and allied products, \$210,240,000; clothing manufacture, \$189,629,000; paper and printing industry, \$146,510,000; leather and rubber goods, \$130,595,000; building and contracting, \$70,344,700; lumber and its remanufacture, \$41,747,700; and tobacco and its products, \$27,648,000.

*History.*—Municipal history in 1910-20 was marked with few items of interest outside of the political aspect and the natural effect of American participation in the World War. The late John G. Johnson, the noted corporation lawyer, who died April 14, 1919, gave the city his collection of 1,300 pictures, appraised at \$444,802, but estimated to be worth \$775,000. In May 1919 the collection of Mrs. Emily L. Harrison was left to the Pennsylvania Museum and School of Industrial Art for permanent exhibition in Memorial Hall. In Oct. of the same year, the George W. Elkins collection of paintings, containing 110 masterpieces of the Dutch, Flemish and 18th-century portrait schools, and valued at approximately \$2,500,000, was left to the city for display in the new Art Museum. In 1921 the late John Howard McFadden, a cotton broker, left to the municipality his collection of about 50 18th-century English paintings, estimated at \$2,000,000. The collection includes the famous Gainsborough, "Lady Rodney," and a number of fine portraits by Romney and Raeburn. Under the will the collection was to be housed in the projected Art Museum in Fairmount Park, provided that it was completed by 1928. In March 1921, the architects announced that it would be completed within three years.

A free library was being built in 1921, and a convention hall was planned for the Parkway, a thoroughfare from City Hall to Fairmount Park completed in 1919. Three large municipal piers were completed between 1916 and 1920 and three more were under construction. An elaborate subway and elevated transit system was being built by the city, the first line of which, to Frandford, was expected to be in operation by 1922.

*War Period.*—Philadelphia sent 54,127 men into the National army through the draft, and nearly equalled that figure with volunteer enlistments in the regular army, National Guard and Marine Corps. The city supplied the personnel of two full regiments of the 28th Div. and practically the full personnel of two regiments of the 70th Div., National army.

The city subscribed to the different Liberty Loans and to the Victory Loan as follows:—

Loan	Apportionment	Subscribed	Per capita Subscription
First Liberty.	\$94,694.750	\$145,172.950	\$80
Second Liberty	139,499.950	234,901.000	130
Third Liberty	136,499.950	199,350.600	94
Fourth Liberty	259,198.000	311,306.250	172
Victory .	186,209.450	208,482.200	115

(A. E. McK.)

**PHILIPPINE ISLANDS** (*see* 21.392).—The census of 1918 gave the pop. as 10,350,640, of whom 855,368 were classed as non-Christians. The 9,495,272 Christians were in 1918: Filipinos, 9,429,857; Chinese, 45,156; Japanese, 6,684; Americans, 6,405; Spaniards, 4,015; English, 1,063; all others, 2,092. The non-Christians were subdivided into Mahomedans and pagans. In 1917 H. Outley Beyer, of the University of the Philippines, estimated the Mahomedan pop. at 315,980, while the pro-

the Romance languages differ among themselves. The English language is used currently in all parts of the islands, being spoken by more people than ever spoke Spanish. Literacy is high among the Christian population. The cultural position of the Negritos is about the same as when they were discovered by the Spanish in 1521. The so-called "wild" peoples (all pagans except for a few who have embraced Christianity) occupy about the stage of culture exhibited in the 16th century by the ancestors of the Christian Filipinos. The culture of the Christian Filipinos is distinctly occidental and is unique in the Orient.

Manila, the capital, and Baguio, the summer capital, located in the uplands, in the Mountain province, are the only two chartered cities. Manila, the metropolis, which coincides with Manila province, had in 1918 a pop. of 283,613, or 20,858 to the sq. m., and Baguio had 5,462. In the 55 provinces and sub-provinces, there were in 1918 881 municipalities, 80 municipalities, and 15 other subdivisions. The largest municipalities in 1918 were: Cebu with 65,300 inhabitants; Albay (Luzon), with 53,105; Iloilo (Panay), with 49,808; Batangas (Luzon), with 41,182; Ormoc (Leyte), with 38,247; Laaoag (Ilocos Norte), with 38,294; and Baybay (Leyte), with 36,934. The most important are Cebu and Iloilo. The most populous provinces are: Cebu, with 857,410 inhabitants; Leyte, with 597,995; Pangasinan, with 567,644; Iloilo, with 508,272; Occidental Negros, with 397,325; Samar, with 380,211; Bohol, with 359,600, and Batangas, with 340,195. The most densely populated provinces, apart from Manila, are Ilocos Sur (Luzon), with 277,470 inhabitants, or 492 to the sq. m.; Siquijor (Oriental Negros), with 56,695, or 461 to the sq. m.; Cebu, with 459 to the sq. m.; La Unión (Luzon), with 160,575, or 459 to the sq. m.; Cavite (Luzon), with 157,347, or 339 to the sq. m.; Pampanga (Luzon), with 257,641, or 313 to the sq. m.; Pangasinan (Luzon), with 292 to the sq. m.; and Laguna (Luzon), with 195,371, or 271 to the sq. mile. The Batanes Is., a sub-province lying N. of Luzon, have the smallest pop. of any provincial division (8,214), and a density of 111 to the sq. mile. The least densely populated is the sub-province of Apayao (Mountain province, Luzon), which has 11,123 inhabitants, but only 6 to the sq. mile. The majority of the people are engaged in agricultural and allied pursuits, and among the professional classes are men of considerable attainments.

*Agriculture.*—Between 1913 and 1918 the cultivated area of the Philippine Islands (total area, 73,585,583 ac. or 115,026 sq. m.) rose from 5,859,877 ac. or 7·96% of the whole, to 7,294,159 ac. or 9·91% of the whole. The *Pinipian* tao or peasant, naturally a good farmer, has been slow to adopt modern and more efficient methods, but through the efforts of the Bureaus of Agriculture and Education a beginning has been made in some places. In 1918 the value of the agricultural output was \$183,470,158. The nine most important crops were those of which the following table shows the area, production and value in 1910 and 1918:—

	Acreage		Production (tons)		Value	
	1918	1919	1918	1919	1918	1919
Rice	3,379,395	2,944,588	1,539,186	819,786	\$67,581,687	\$31,309,133
Abacá (manila hemp)	1,265,894	1,175,585	166,863	168,452	46,246,612	13,476,171
Coco-nuts	828,936	405,556	1,506,796,110 (number)	937,927,927 (number)	28,266,896	19,470,813
Sugar-cane	507,612	205,412	396,242	152,639	20,579,389	7,631,966
Indian corn	1,033,413	1,432,026	399,798	392,484	10,509,324	11,774,525
Tobacco	193,754	134,456	61,535	28,064	7,609,315	3,780,915
Cacao	2,820	3,131	506	74	252,335	33,406
Coffee	1,896	2,637	721	85	222,991	34,378
Maguey (aloe)	80,524	21,237	16,664	4,628	1,853,606	277,700

vincial governors of Mindanao and Sulu estimated it in 1919 at 402,799. Of the pagans, approximately 30,000 were Negritos, and most of the others belonged to Malayan stocks. Head-hunting among the pagans virtually ceased owing to vigilant Government control.

The Christians include eight races, namely, Tagalog, Sambal, Pampanga, Pangasinan, Iloko, Ibanag, Bicol, all inhabiting the island of Luzon and islands near it, and the Bisaya, inhabiting the southern islands, including part of Mindanao. Each race has a distinct language, which differs from the others as widely as

The production of rice fails to meet demand, and imports are necessary. In 1910 imports amounted to 184,620 tons, and total consumption to 712,674 tons; in 1918 imports and exports were respectively, 159,130 tons and 47 tons; and consumption, 1,161,344 tons; in 1919 imports and exports were respectively 148,724 and 296 tons, and total consumption, 1,067,699 tons. To prevent profiteering in so vital a commodity, the Government has, in times of scarcity, purchased rice abroad, and sold it at a fair price. The cultivation of abaca has been given a new impetus by a law (No. 2380) which grades the product according to the cleaning of the fibre. Sugar is raised in almost all the islands, but chiefly in Negros, Panay and Luzon. The construction of up-to-date sugar "centrals" in many localities

is redeeming Philippine sugar from the evil reputation which the "muscavado" sugar formerly bore. Corn is raised chiefly in Cebu, where the soil is especially fitted for it, and where this grain, instead of rice, is the chief crop. Tobacco is raised especially in Luzon and Cebu, the product of the Cagayan valley in Luzon being that most esteemed. Cacao comes chiefly from the provinces of Albay and Camarines in Luzon; coffee from Mindoro I. and the Mountain province (Luzon); and maguey (introduced from America) from Cebu and the province of Ilocos Sur (Luzon). An effort is being made to encourage the raising of sisal instead of maguey, the former being the better fibre. Abaca is a natural monopoly in the Philippine Islands, for it can be grown commercially nowhere else. It is grown in many of the islands, but in recent years extensive plantations have been laid out in Mindanao, where the constant moisture needed for its growth is afforded. For many years, this fibre formed one-half the exports from the islands, and is still one of the leading exports. The export of 89,438 metric tons in 1900 rose to 164,754 tons in 1910, and to 165,129 tons in 1918. Exports for 1910 fell to 131,898 tons valued at \$26,861,526, while exports for 1920 were 139,250 tons valued at \$35,862,000. The timber resources are important, virgin forests covering about 40,000 sq. miles. About 99% of all timber lands belong to the Government. Much of the timber consists of valuable hard woods. Timber land is not sold, but is developed under the licence system, small operators being granted a licence for one year, and large operators for 20 years. During 1919, 2,950 licences were issued, some of which were for gathering firewood. About 100,000,000 bd. ft. of lumber is used annually in the Philippines. Exports of lumber in 1918 were 4,178,520 bd. ft., valued at \$219,397, and in 1919, 4,503,304 bd. ft., valued at \$259,592. Modern forest products include charcoal, nipa, from which sugar and alcohol are made, various rattans and fibres, copal, tan barks, dyewoods, gutta percha and rubber, paper pulp, a soap bark, pili nuts, wax, wood-oil and medicinal plants. A school of forestry is maintained by the Government in which up-to-date, scientific lumbering instruction is given. The chief animal is the carabao or water buffalo, of which there were 1,047,164 in 1913 and 1,271,208 in 1917. Other domestic animals for these two years numbered respectively: cows, 418,114 and 603,107; horses and mules, 179,089 and 214,204. During most years of American occupation, the carabao was assailed by rinderpest, and the archipelago in 1920 was slowly recovering from its effects. The heavy mortality of carabao hampered agriculture, especially the cultivation of rice which was much retarded at times. The Government employed various methods in its efforts to eradicate the disease, including inoculation with a special serum, strict quarantine, and even the killing of whole herds.

**Minerals.**—Mineral products include gold, silver, iron, copper, manganese, coal, petroleum, shale, sulphur, asphalt, asbestos, clay products, lime, sand and gravel, stone, salt, and mineral waters. The total value of the mineral output in 1907 was \$117,046; in 1917, \$3,018,225; and in 1918, \$3,276,677. Between July 1 1902 and Dec. 31 1918, 10,943 mining claims were taken out, of which 6,683 were for gold, 18,934 for petroleum and 607 for copper. The gold output in 1908 was valued at \$217,250; in 1913 at \$288,362; in 1917 at \$1,408,309; in 1918 (from 24 mines) at \$1,867,985 and in 1919 at \$1,309,724. Iron-ore deposits in Surigao province, estimated to contain about 500,000 metric tons, with 45 to 50% iron, have been reserved for the Government. Other rich deposits are said to exist in Bukidnon province in Mindanao. The manufactured iron all came from the mines of Angac in Luzon and was chiefly used for the making of plough points. Copper is found especially in Luzon at Mancayan, where it has been mined and smelted many years by the Igorot by primitive methods. Deposits of coal are found in many localities, although much of it is lignite. Attempts have been made to develop the deposits in the eastern part of Batan I., and in 1920 the Philippine Coal Mining Co. was said to be producing about 300 tons daily. In 1919 the output was 32,892 metric tons, valued at \$411,000. Much attention has been given to the development of the coal deposits by the Government, and no little money was lost, but the industry seems at last to be on a good basis. Deposits of fair steaming coal are said to cover 58 sq. m. and to contain 61,788,000 metric tons. The National Coal Co. was organized in 1919, with Government capital, to exploit Government deposits.

**Manufactures.**—The Philippines have passed beyond the initial stage of manufacturing, although it is probably true that the manufacturing industries will long be limited in number. Embroideries and laces, the making of which has been fostered by the Bureau of Education as well as by some private schools, find a ready market, and during the World War when Belgium and Switzerland were unable to supply their markets, demand for the Philippine product was stimulated. The industry is still largely one of the home. Rope is made from abaca, both by the old rope-walk method and by modern machinery. Much of the abaca is stripped by machinery, although fibre cleaned carefully by hand is still the best. Saw-milling is increasing in importance, some of the mills being equipped with modern machinery. In 1910 there was only one sugar "central" in the archipelago for the production of centrifugal sugar. In 1920 there were 28, and the reputation of Philippine sugar was rising in consequence. The war gave a great stimulus to the expressing of

coco-nut oil, because of the impossibility of obtaining sufficient shipping for the export of the bulky copra. There were in 1920 more than 30 oil-mills, which produced over 100,000 tons of oil, the value of the product having increased in five years from about \$1,000,000 to about \$30,000,000 and furnishing about one-fourth of the export trade of the islands. The Philippines are the third producing coconut region in the world, there being over 800,000 ac. with about 68,000,000 trees, of which some 40,000,000 were bearing in 1920. The output of cigars in 1910 was 285,561,328; in 1913, 282,096,996; in 1918, 367,022,982 and in 1919, 517,343,450. The output of cigarettes for the same years was respectively 4,173,507,249; 4,384,807,247; 4,720,005,675 and 5,203,331,200. In 1918 there were 82 factories manufacturing cigars and 23 manufacturing cigarettes. In 1916 a tobacco inspection law was enacted by the Philippine Legislature providing for the improvement of the leaf and for inspection of leaf tobacco and of manufactured products, and prohibiting export to the United States unless certain fixed standards were met. In 1918 there were 10,583 factories in the archipelago, of which 1,047 were in Manila. Of the 182,117 employees, 21,828 were in Manila.

**Communications.**—In 1908 there were only 246 m. of first-class roads and bridges in the archipelago; in 1913, 1,303 m. of the first class; 1,264 m. of the second; and 1,937 of the third; and in 1919, 2,796; 1,235; and 1,984 m. respectively. Third-class roads are as a general rule fit only for carts and animals, and then only during the dry season. In 1919 cost of maintenance of old roads and bridges was \$1,959,780. The archipelago has two railway systems, namely the Manila Railroad Co. operating in Luzon, and the Philippine Railway Co. operating in the islands of Cebu and Panay. The first had in 1913 517 m. of tracks and in 1918 640 m. This company, under contract with the Government, partly completed a line to the summer capital, Baguio, but could not carry the project to a successful end. In Jan. 1917 the Government of the Philippine Islands purchased the company's holdings and since that period the lines have been undergoing reconstruction. The Philippine Railway Co., an American concern, had 60 m. of track in 1910 (the first year of operation), and 133 m. in 1918. Under authority of an Act of Congress, approved Feb. 6 1905, the Insular Government guarantees 4% interest for a period not to exceed 30 years on the first lien bonds issued by the Manila Railroad Co. for new construction in southern Luzon, and the same to the Philippine Railway Co. The combined issues of both companies totalled \$22,263,000. The lines in southern Luzon and those in Cebu and Panay have opened to active trade large stretches of territory and are affecting the industry of their districts. During recent years the number of motor vehicles has increased markedly, and they are now seen in almost all parts of the islands. An up-to-date electric street-railway system is operated in Manila. Post-offices increased in number from 540 in 1908 to 828 in 1918, and municipalities with free delivery service from 31 in 1908 to 462 in 1918. Telegraph offices (Government owned and operated) increased during the same period from 161 to 320. The inter-island cables are also owned and operated by the Government. Manila has an efficient telephone service.

**Shipping.**—Manila is the chief port, but the ports of Iloilo, Cebu, Zamboanga, and a few others share to some degree in the domestic and foreign trade. In 1911 there were 906 entries of foreign ships and 854 departures, with net tonnage of 1,849,475 and 1,787,650 respectively; and in 1918, 652 entries and 659 departures, with net tonnages of 1,412,871 and 1,544,648 respectively. The United Kingdom, which had uniformly occupied first place in the total foreign carrying trade of the islands, lost that position to Japan in 1917, but regained it in 1919, when British bottoms carried 525,000 tons. In the latter year, British and Japanese vessels carried 63% of the total foreign trade. Ships of the United States, which moved only 44,000 tons in 1916, moved 441,000 tons in 1919, while Philippine shipping engaged in foreign trade rose from 80,000 tons in 1916 to 126,000 tons in 1919. In value of cargo, British bottoms led in the import carrying trade up to and including 1917. In that year British ships carried cargoes valued at \$25,865,273; Japanese, \$18,964,331; and United States, \$9,731,816. In 1918, Japanese ships carried import cargoes valued at \$29,304,836; United States, \$28,041,294; and British, \$24,406,231. In the export trade, British bottoms also took first place up to and including 1917. In that year, British ships carried exports valued at \$28,903,609; United States, \$27,599,076; and Japanese, \$24,657,632. In 1918 U.S. vessels carried exports valued at \$53,389,398; British, \$36,093,713; and Japanese, \$24,544,204. In 1918 ships of the United States took first place in the total value of the foreign carrying trade, moving goods valued at \$81,403,692, with the United Kingdom and Japan taking second and third place respectively. In recent years new piers and warehouses have been built in Manila.

**Foreign Trade.**—Imports rose from \$29,186,120 in 1908 to \$149,400,000 in 1920. Exports were \$32,601,072 in 1908; \$151,100,000 in 1920. The balance of trade was in favour of the Philippines during 1914-8, and in 1920. Import trade with the United States rose from \$35,813 in 1874 to \$92,289,773 in 1920. Exports to the United States rose from \$2,657,333 in 1874 to \$105,216,263 in 1920. In 1874 the import and export trade with the United Kingdom was valued respectively at \$1,737,487 and \$3,032,950; and in 1918 at \$2,764,407 and \$19,481,698 respectively. Imports from and exports to Japan were valued respectively at \$13,104,055 and \$7,968,304;

China, \$6,576,962 and \$3,249,290; French East Indies, \$6,978,043 (mainly rice) and \$1,302,376; Hong-Kong, \$56,877 and \$5,051,664. Total trade with France was valued at \$1,785,167 in 1918; Germany, \$366,534; Spain, \$3,040,167; Australasia, \$4,431,883; British East Indies, \$3,515,885; Switzerland, \$607,870; Italy, \$189,152; Netherlands, \$45,463; Hawaii, \$479,436; Siam, \$1,219,673 and all other countries, \$1,494,421.

**Government.**—In 1913, upon the occasion of the appointment by the President of the United States of a new governor-general of the Philippines, majority membership on the Philippine Commission was given to the Filipinos by presidential appointment. On Aug 29 1916 the U.S. Congress passed the Jones Act. The short preamble declared that "it has always been the purpose of the people of the United States to withdraw their sovereignty over the Philippine Islands and to recognize their independence as soon as a stable form of government can be established therein." The Act created a Senate to supersede the Philippine Commission, 12 senatorial districts being established, each of which is represented by two senators elected by duly qualified voters except the 12th district (consisting of the Department of Mindanao and Sulu, the Mountain province, Baguio, and Nueva Vizcaya), whose senators are appointed by the governor-general. The Philippine Assembly was replaced by the House of Representatives, the membership of 81 of the Assembly to be increased in the new body by three representatives from the Mountain province, one from Nueva Vizcaya, and five from the Department of Mindanao and Sulu. Senators are required to be over 30 years of age, able to read and write English or Spanish, and to have been residents of the Philippines for at least two consecutive years and actual residents of the senatorial districts from which elected for at least one year immediately preceding election. Representatives must be over 25 years of age, and have the same residential qualification.

Senators are elected for six years, representatives for three. The Act extended the suffrage to males of 21 or over, to include those who under previous law were legal voters and had exercised their right; those who owned real property to the value of \$250; those who annually paid \$15 or more of the established taxes; and those who were able to read and write either Spanish, English, or a native language. Two resident commissioners with three-year terms were provided for, and paid by, the United States, to be over 30 years of age and *bona fide* electors; these commissioners to have seats in the House of Representatives at Washington, with right of debate but no vote in that body. The Legislature convenes on Oct. 16, but it may change that date within certain limits if it choose. A governor-general, vice-governor, auditor, and deputy auditor are appointed by the President of the United States, by and with the consent of the Senate. The vice-governor is in control of the Bureaus of Education and Health, but the remainder of his former bureaus and his subordinate duties were shifted to the Interior Department. Power is given to the Legislature to reorganize the other departments and bureaus of the Government. The chief justice and associate justices of the Supreme Court are appointed by the President of the United States by and with the consent of the Senate, and the judges of the courts of first instance are similarly appointed by the governor-general by and with the advice of the Senate of the Philippine Islands. The awards of the Supreme Court are reviewable by the Supreme Court of the United States.

The Government as reorganized consists of the following groups of departments, bureaus, and offices. On the governor-general depend directly the Bureau of Audits, the civil service, and all other offices and branches of the service not assigned by law to any department. On the Department of the Interior depend the Bureau of Non-Christian tribes (provided for in the organic Act), the Philippine general hospital, Boards of Pharmaceutical Examiners, Medical Examiners, Dental Examiners and Dental Hygiene, Optical Examiners, examination for nurses. On the Executive Bureau depend the Philippine constabulary, and Bureau of Dependent Children. On the Department of Public Instruction depend the Bureau of Education, the Philippine Health Service, and Bureau of Quarantine Service. On the Department of Finance depend the Bureaus of Customs, Internal Revenue, Treasury and Printing, the general supervision over banks, banking transactions, coinage, currency, and (except as otherwise specially provided) over all funds the investment of which may be authorized by law. On the Department of Justice depend the Bureau of Justice, the courts of first instance

and the inferior courts, Philippine Library and Museum, Bureau of Prisons and Public Utility Commission. On the Department of Agriculture and Natural Resources depend the Bureaus of Agriculture, Forestry, Lands, Science, Weather, and matters concerning hunting, fisheries, sponges and other sea products. On the Department of Commerce and Communications depend the Bureau of Public Works, Posts, Supply, Labor, Coast and Geodetic Survey, and Commerce and Industry. The secretaries of the several departments form the Cabinet.

There are in all 46 provinces, 34 of which are regular provinces and the rest special or sub-provinces. The chief executive of a province is the provincial governor, who is elective. He together with two other members, also elective, forms the provincial board or legislative branch of the provincial Government. In the special or sub-provinces, with the exception of Mindoro, Palawan, and Batanes, the provincial governor is appointive. The chief official of a town or municipality is the municipal president. The municipal council or legislative branch of the municipal Government consists of from 8 to 18 councillors, according to the size of the municipality.

In Oct. 1918 the governor-general, by an executive order, created the Council of State as an advisory body. This body, composed of the heads of all the executive departments and the presiding officers of the two Houses of the Philippine Archipelago, has become an integral part of the governmental system and is frequently referred to in legislation. The meetings of the Council have practically superseded those of the Cabinet, and it has been entrusted by the Legislature with certain executive functions. Policies decided on in the Council meeting are assured full consideration in the Legislature. Among other things the Council prepares and submits the budget.

**Education.**—Special attention has been paid to public education by the Government. Each of the 49 school divisions of the archipelago follows in general provincial boundary lines, except that of Manila and four insular schools, namely Philippine normal school, Philippine school of arts and trades, Philippine nautical school, and Central Luzon agricultural school, each of which is considered a distinct division. The public-school system, which aims at the creation of a staff of English-speaking Filipino teachers, is under the director of education, with central offices in Manila. There are seven elementary grades (four primary and three intermediate) and a four-year high-school course. Much attention is paid to industrial training, and to recreational athletics. Baseball and other games have had great influence throughout the islands. Each school division is in charge of a division superintendent and each of the several districts in a division of a supervising teacher. In 1908 there were 3,932 public schools, with a total enrolment of 486,676. In 1919, 749 new primary schools and 111 new intermediate schools were opened, with an increase during one year of 104,566 pupils in the elementary grades, and a record enrolment of 776,596 pupils in all public schools. During that year, 2,963 additional elementary teachers were appointed, and 300 primary schools constructed. Tuition fees were abolished in all intermediate schools. In 1908 \$2,563,553 was spent for public education, and in 1918 \$5,365,105. The Philippine normal school, in Manila, draws its pupils from all parts of the islands. There were in 1920 50 provincial high schools, 20 provincial trade schools, 14 provincial shops, 13 large agricultural schools, 15 farm schools, and 162 settlement farm schools. The farm schools ranged in size from about 125 to 2,000 ac. and the settlement farm schools from about 40 to 125 acres. School gardens, which have become an essential part of the public educational system, number about 4,000, and home gardens, the result of this instruction, over 100,000. A standard type of school buildings has been evolved, and there were in 1920 865 satisfactory school buildings (many constructed of concrete) and 2,170 buildings of semi-permanent and permanent types. In 1910 the Government began the systematic supervision of private schools, requiring courses in English and harmonizing the work with that of the public schools. New methods, courses, and text-books have been introduced, and all private schools complying with requirements have been given the same standing as Government schools. In 1920 there were about 300 accredited private schools with a total enrolment of 38,544 and a teaching force of 1,600. Higher education is provided for by the university of the Philippines, a Government institution, and by the Dominican University of Santo Tomás. The university of the Philippines in 1920 had 31 buildings of permanent materials. The total enrolment for 1919-20 was 3,427. Its three presidents were, successively, an American, a Filipino and an American. The university of Santo Tomás, the oldest university under the flag of the United States, has departments of law, medicine, pharmacy, civil engineering, philosophy and letters, and theology. It has five buildings including a dormitory, and for the year 1919-20 had an enrolment of 701. Between the years 1914 and 1919 its graduates numbered 347. The educational programme of the islands has from the first had the hearty endorsement of the Filipino people, and Filipino legislators have at all times supported almost unanimously any movement looking toward the improvement of educational conditions. In Dec. 1918, \$15,000,000 were appropriated by the Legislature for the extension of public schools. Instruction is being extended rapidly among the non-Christian population. In addition to the education supplied in the Philippines, some 9,000 Filipinos are attending schools, colleges and universities in the United States;

some of these receive Government aid, but the majority are paying for their own instruction. The work of the Philippine library and museum is largely educational in character. This institution was first founded as the Philippine library, May 20 1909. After the passage of the Jones Bill of 1916 it was amalgamated with the Philippine archives and the museum. It has charge of all the books owned by the Insular Government. The manuscripts of the library number several millions, the books in all over a quarter of a million.

**Finance.**—Philippine currency in circulation on June 30 1908 amounted to 40,337,982 pesos or 4.82 *per capita*; on Dec. 31 1913 to 50,697,253 or 5.53 *per capita*; and on Dec. 31 1919 to 146,500,000, or 14.16 *per capita*. The Philippine peso, nominally equivalent to \$0.50 U.S., was in June 1921 quoted in New York City at \$0.46 and has even reached much lower levels; in Nov. 1921 it was quoted at \$0.4975. The total revenues and expenditures of the Insular Government for the year ending June 30 1908 were respectively, \$10,899,261 and \$11,469,785; and for 1919, \$39,843,461 and \$43,371,294. The great increases in revenues began in 1916 simultaneously with the large trade balances in favour of the Philippines. Revenues are mainly from customs collections, internal revenues and receipts from land taxes and leases. Customs collections for the year 1919 were \$7,712,653 and for 1920, \$8,878,932; and collections of internal revenues for 1919 \$26,641,373. The latter collections come mainly from the excise tax, licence, profession and occupation taxes, cedulas, franchise taxes, income tax, documentary stamp tax, and inheritance tax. The bonded indebtedness for the Insular and municipal Governments as of June 30 1919 was \$20,125,000, that for the former being \$16,000,000. Commercial bank assets rose from \$31,872,964 in 1913 to \$177,293,860 in 1919. In 1908 postal savings bank deposits were \$774,105 and withdrawals \$512,839; and in 1918 \$2,942,762 and \$2,599,775 respectively; in 1919 there were 417 postal savings banks in operation. In 1919, operations of the eight banks in Manila reached a total of \$4,197,682,000. The Philippine National Bank, the sole depository of the Government, with headquarters in Manila, has 11 branches and 41 provincial agencies in the Philippines, and branches in Shanghai and New York. Its assets on June 30 1920 amounted to \$118,749,138. More recently reverses, due, it is reported, to poor management and the business crisis, overtook the institution.

**History.**—W. Cameron Forbes was appointed acting governor-general in May 1909, and on Nov. 11 of the same year governor-general, succeeding James T. Smith. During his term, which expired on Oct. 6 1913, many public improvements were made, and the principle of the Filipinization of the civil service was carried out consistently, although comparatively few Filipinos were appointed to the higher offices.

The Taal volcano, which had been quiescent for a century and a half, erupted on Jan. 30 1911. Some 1,300 lives were lost. The outbreak was accompanied by violent earthquakes, of which 1,014 were registered in Manila in about a fortnight. Earthquakes are of frequent occurrence in all parts of the islands, but are rarely of magnitude. During Governor-General Forbes's term no general appropriation measure for the expenses of Government was passed after that of 1910, because the two Houses could not agree upon the method of drawing it. In consequence, the provision of the organic Act of 1902 which declared that in the event of the failure to pass a general appropriation measure, the sum appropriated last should be considered as reappropriated, was declared to be in effect, and proclamation was so made each year. The breach between the two Houses tended to widen, and much constructive legislation that should have been enacted failed of passage. Educational measures, however, were generally assured of enactment and one is continually struck by the number of measures of this kind passed by each session of the Legislature. During this period also the demand for political independence by certain Filipino leaders, especially by Manuel Quezon, for part of the time resident commissioner in Washington, was constant and insistent. The Americans in the Philippines, regarded as appointees of the political party in control in the United States, were skillfully made to appear hostile to Filipino interests, and that administration was represented as withholding an inherent right of the Filipino people. The desire of the Filipinos for independence was and is real, and has grown with each succeeding year; the whole course of American administration has fostered that aspiration, and continually greater autonomy has been granted, although differences of opinion have been manifest as to the safety with which this could be done.

The change of administration in Washington in 1913 was hailed with delight by the Filipinos, in the belief that it would soon lead to political independence. On Oct. 6 1913 Francis Burton Harrison, who had been appointed governor-general by President Wilson, arrived in Manila, and immediately assumed office. By presidential appointment the majority on the Philippine Commission passed to the Filipinos. Various changes were made by the new governor-general in the personnel of several of the bureaus, the chief innovation being that Filipinos were appointed to a number of the higher posts. On Jan. 1 1917 there were 31 Americans and 22 Filipinos acting as chiefs and assistant chiefs, and on July 1 1920, 20 Americans and 30 Filipinos. On the latter date there were 760 Americans and 12,047 Filipinos connected with the Government, while in 1913 there had been 2,623 of the former and 6,363 of the latter. This increased rapidly in the Filipinization of the civil service after 1913, especially of the higher offices, has been criticized on the ground of decreased efficiency, but while this was necessarily the result to a considerable extent, it was not universally so, and the policy led, as a natural corollary, to a greater official harmony than had reigned previously. In Feb. 1916 an Act of the Legislature, providing a temporary pension for employees who had been in the service of the Philippine Government for from six to ten years or longer, gave an impetus to many Americans to request retirement under the terms of that Act. While technically the provisions of the Act apply to Filipinos as well as to Americans, it has been the policy of the Government to retire eligible Filipinos only because of age or physical disability. Upon the declaration of war against Germany by the United States, many Americans resigned to enlist, and it was felt that Americans were leaving the Philippine service too rapidly, especially the teachers. A very earnest effort was made after the war to recruit American teachers.

The virtual Filipino autonomy resulting from the above-mentioned changes was increased by the enactment by Congress in Aug. 1916 of the Jones Act, by which the Philippine Commission was replaced by an elective Senate (see *Government* above). The era of good feeling, inaugurated in 1913 by the change of Government, was seen almost immediately in the passing of an appropriation measure for the general expenses of Government—the first to be enacted since 1910. Such measures have been passed annually since. One of the early Acts of the Legislature was to reduce certain salaries, especially those of the Philippine commissioners and of certain bureau chiefs; but, as in the United States, a bonus system was later adopted because of the increase in the cost of living and the governor-general recommended that salaries be increased. In 1915 the Philippine National Bank was created, taking over the former Agricultural Bank owned by the Government, which had never functioned acceptably. In the same year the Code Committee, after several years' work, finished the administrative code of the islands, which was passed by the Legislature. Among the first Acts of the all-Filipino Legislature of 1916-7 was the reorganization of the several departments of the Government, the result being that the Department of Public Instruction came to be the only one directly under an American.

The period was marked by generous appropriations for educational purposes, the most notable of these being the appropriation of \$15,352,912 for the extension of free elementary education (see *Education* above). A previous Act prohibiting the display of the Philippine flag was repealed, a measure desired most ardently by Filipinos.

Upon the declaration of war against Germany by the United States, the Filipinos offered to supply a division of troops for the U.S. army and to supply funds for the construction of a destroyer and submarine for the U.S. navy, and there was a generous subscription to the Red Cross and to Liberty bonds. A volunteer National Guard was formed, which was joined by many of the Filipino youth, this being disbanded in 1919. There were also many Filipinos who served in the army and navy of the United States. In this connexion it should be noted that Filipinos have been admitted to West Point and Annapolis. Some 22

German ships, which had been interned in Manila harbour at the beginning of the World War, were seized after the American declaration of war, and the crews sent to an internment camp in the United States after a partly successful attempt had been made to damage the machinery and scuttle the vessels. Business during the war was brisk, notwithstanding the lack of shipping; but after the war, a depression developed from which the islands had not recovered in 1921. Governor-General Harrison resigned his post, as from March 3 1921, because of the change of administration in the United States, and Vice-Governor Yeater became acting governor-general. Shortly after assuming office, President Harding despatched Maj.-Gen. Leonard Wood and W. Cameron Forbes to the Philippines to make a complete survey and report on conditions. On Oct. 5 1921 Gen. Wood took oath of office as governor-general of the islands.

The Wood-Forbes report recommended, among other things, "that the present general status of the Philippine Islands continue until the people have had time to absorb and thoroughly master the powers already in their hands," and "that under no circumstances should the American Government permit to be established in the Philippine Islands a situation which would leave the United States in a position of responsibility without authority."

**PHILLIMORE, WALTER GEORGE FRANK PHILLIMORE**, 1ST BARON (1845- ), English judge, was born in London Nov. 21 1845, the eldest son of Sir Robert Joseph Phillimore, 1st bart., a distinguished judge and authority on ecclesiastical and international law (see 21.405). He was educated at Westminster and Christ Church, Oxford, where he had a distinguished career, obtaining first classes in classics and law, winning the Vinerian scholarship and being elected to an All Souls fellowship. He was called to the bar in 1868. In 1885 he succeeded his father as 2nd bart., and in 1897 was made a judge of the Queen's Bench division, being in 1913 appointed a lord justice of appeal. He retired from the bench in 1916, and in 1918 was raised to the peerage.

As an authority on ecclesiastical law Lord Phillimore carried on the tradition of his family. He published a revised edition of J. H. Blunt's *Book of Church Law* (1872), besides a second edition of Sir Robert Phillimore's *Ecclesiastical Law* (1895), and also contributed the articles *Ecclesiastical Jurisdiction* and *Canon Law* (in part) to the *E.B.* He was from 1905 to 1908 president of the International Law Association, and has published *Three Centuries of Treaties of Peace and their Teaching* (1917), besides issuing (1889) a third edition of vol. iv. of Sir Robert Phillimore's *International Law*. In 1918 he was appointed chairman of the naval prize tribunal. He was English representative on the commission which sat at The Hague (1920) to prepare the scheme of a permanent Court of International Justice, and was also chairman of the Foreign Office committee on the League of Nations.

**PHILLIPS, STEPHEN** (1868-1915), English poet (see 21.407), died at Deal Dec. 9 1915.

**PHILLIPOTS, EDEN** (1862- ), British novelist, poet and dramatist, was born in India Nov. 4 1862, and was educated at Plymouth. He was a clerk for ten years in the Sun fire insurance office, then studied for the stage, but turned his attention to literature, producing a number of successful novels with a Devonshire setting. They include *Some Everyday Folks* (1893); *Children of the Mist* (1898); *The Human Boy* (1899); *Sons of the Morning* (1900); *My Devon Year* (1903); *The Mother* (1908; dramatized 1913); *Orphan Dinah* (1920) and a play, *St. George and the Dragons* (1919). His play, *The Secret Woman* (dramatized from his novel of that title), was refused a licence but, after a public protest by twenty-four authors, it was performed six times at matinées in 1912 under the management of Mr. Granville Barker. He also published single poems such as *The Iscariot* (1912), and two collections of poems, *Plain Song* (1917) and *As the Wind Blows* (1920).

**PHILOSOPHY** (see 21.440).—At the opening of the decade 1910-20, the ground covered by the philosophical sciences was so vast that any one writer could see only a small portion of it in clear perspective; and even within the partial field where he was most at home, he might well find it hard to catch the real drift of tendencies which had not fully disclosed their ultimate scope.

Among the leading philosophers of that date three distinguished representatives of already established types of thought, William James, Shadworth Hodgson and Alfred Foulle, were shortly to pass away. In Shadworth Hodgson there passed from the scene perhaps the last survivor of the classic "British" succession of thinkers, whose characteristic method in philosophy was the direct psychological analysis of the given "moment of experience" as distinct from metaphysical or epistemological inquiry into the "transcendental" implications of Being or of Thought. His philosophy seems likely to be the last attempt to develop a system in entire independence of the influence of Kant's "Copernican revolution," unless, indeed, the recent work of Prof. S. Alexander should prove capable of development into something like a system. William James's work in general philosophy exhibits three distinct strains, none too closely connected with one another: (1) a fundamental *metaphysical* pluralism; (2) a radical empiricism in *method*; (3) the adoption in *logic* of a purely utilitarian theory of truth and falsehood. It was this peculiar view of truth as "that which works" or "that which produces practically useful results" which, from its apparently paradoxical character, made the principal sensation among James's contemporaries for the moment, and from which he chose the name ("pragmatism") for his type of thought; but it is open to question whether his abiding place in the history of philosophy will not depend primarily on his brilliant defence of pluralism against the singularism of philosophies of the "one substance" and "absolutist" types.

The outstanding event in 1910-2, as far as philosophy is concerned, was certainly the rapid rise of Bergson to a European reputation. *Les Données Immédiates de la Conscience* had been published as long ago as 1889, *Matière et Mémoire* in 1896, and *L'Évolution Créatrice* had reached a fourth edition in 1908, but the author's ideas can hardly be said to have attracted universal attention much before 1910. The English translations, *Time and Free Will*, *Matter and Memory* and *Creative Evolution* all belong to 1910-1. A great amount of work in various European languages appeared in exposition or criticism of Bergson's special tenets. Special reference may perhaps be made to H. W. Carr's *Henri Bergson, The Philosophy of Change* (1911), and J. McKellar Stewart's *A Critical Exposition of Bergson's Philosophy* (1912). Without attempting to pronounce on the permanent value of Bergson's ideas, it may at least be said that his works contain the most systematic and brilliant exposition of Irrationalism since Schopenhauer, and that his presentation has the advantage of exhibiting the irrationalist position unencumbered by Schopenhauer's temperamental pessimism.

Bergson's main doctrine may perhaps be briefly summarized as follows. The human intellect is itself a product of evolution, a tool fashioned by natural selection for the purpose of enabling mankind to find their way about among the inanimate bodies

which make up their physical surroundings. Hence the crowning achievement of the intellect is the creation of the science of geometry, which therefore furnishes the ideal model to which human science in general is everywhere striving to approximate. The aim of all sciences is to become exact sciences, *i.e.* sciences of number and measure. But the only magnitudes which we can measure directly are straight lines. Consequently all measurement of other magnitudes has to be effected by artifices which enable us to substitute lengths for the various "intensive" magnitudes (lapses of duration, degrees of temperature, electric charges, and the like), which meet us in the "real world" of actual life. In particular, the measurement of time only becomes possible by the artifice of representing the real duration through which we live by the image of a line on which we can measure off different lengths. This device, though indispensable to science, inevitably falsifies the facts of living experience. For it gives rise to the belief in a "Newtonian" time, which is homogeneous, like the straight line, and "flows equally," whereas the "real duration" of experience, which is the very stuff of which our inner life of feeling and conation is made, is non-homogeneous and "flows" with very varying rapidity according as we are well or ill, interested or bored, pleased or pained, and the like. From the initial substitution of the unreal "uniform" time of science for the infinitely varying "real duration," out of which the processes of life and consciousness are made, further arise all the illusions characteristic of a mechanical theory of the universe. It is our tendency to envisage time under the form of a line, which leads to the belief in permanent "substances" or things, as the bearers or supports of change, and further conducts us to the notion of a rigid determinism by producing the illusion that what happens in the various moments of time is all completely "given" at once, as all the points on a straight line are given "simultaneously." This again leads to a radically false conception of "evolution." It creates the belief that nothing radically new is ever produced in the evolutionary process; whatever emerges in the course of the process, on a determinist theory, must be already completely contained in its antecedent conditions, and adequate knowledge of those conditions must enable you to say beforehand exactly what will emerge from them. Hence for science, which to be true to its geometrical ideal must be strictly mechanical, the whole process of evolution can be nothing but the rearrangement, according to mechanical law, of selfsame and permanent units. Real life, as we know it at first hand in the act of living it, is of a wholly different kind. It is a single continuous process of becoming, in which there is no permanent substratum; it presents us at every moment with the emergence of the qualitatively new, fresh qualities, fresh adaptations to environment, which could never have been anticipated from any knowledge of what had gone before, until they had actually emerged. You cannot expect to know the direction this *élan vital*, as Bergson names the impulse which Schopenhauer had called the "will to live," will take until it has been actually taken; life is thus essentially contingent. (It follows, of course, that determinism is false as regards that special manifestation of the *élan vital* which we call will or choice. To speak of our decisions as necessitated or determined by our pasts is virtually to think of them as already made for us before we make them.) Instinctive or impulsive activity is thus but a manifestation of the forward-going *élan vital*, the tendency of the process which is life to exhibit itself in ever newer forms. Science is the inevitably unsuccessful attempt of the intellect to reconstruct the process in "geometrical" form by reversing its sense. It looks back at a process which has culminated in the appearance of something new (*e.g.* a new modification of an animal species), notes what the earlier stages of the process have been, and then assumes that it could have predicted from a knowledge of antecedent conditions the new manifestation of the *élan vital* with which it had, in fact, to be already acquainted before it could think of the antecedent events as conditions of this result. Hence, if philosophy is to understand life, its method must be the reverse of that of the scientific intellect. It must renounce the intellect and its logic, which latter is indeed merely the ab-

stract schematism of the "geometrical" procedure, and surrender itself without reserve to the intuitions and presages which attend on complete immersion in the stream of the *élan vital*.

It may perhaps be suggested that the real test of Bergson's ability to construct an irrational philosophy on this basis must be sought in the success with which it can be applied to the interpretation of the spiritual life of humanity, a task with which Bergson has not as yet fully grappled. Meanwhile, there appear to be some reasons for doubting whether the foundations of his thought are themselves securely laid. The condemnation of the intellect is based upon the assumption that because it is a "product of evolution" it can have no function but that of enabling us to find our way about among things; this is why geometry, which deals with the "surfaces of solid things," is declared to be its highest achievement, and why it is denied all value for the interpretation of life. But it might reasonably be contended that from the dawn of time men have had to occupy themselves at least as much with reaching a common understanding of one another as with learning their way about among "solid bodies," and that we should therefore expect an intellect which is a "product of evolution" to be competent to deal with life as well as with the surfaces of solid bodies. Again, it is plain that the alleged necessity for science of a spatial schematism, which inevitably misrepresents the facts of "real duration," depends entirely on the results of the one chapter (*Données Immédiates de la Conscience*, ch. 1) which expounds the author's peculiar theory of measurable magnitudes. Now this chapter bears evident marks of hasty construction. The author seems to have forgotten that even in geometry straight lines are not the only measurable magnitudes. It is indispensable that we should be able to measure angles, a consideration which of itself should have given the author pause. In fact, the whole treatment of the distinction between "extensive" and "intensive" magnitudes, upon which so much depends for Bergson's development of his theory, is, as it stands, at least perfunctory. Again, the very language employed to distinguish "real duration" from the unreal time of science, *viz.* that the portions of real duration flow with varying *rapidity*, seems to imply that these varying rapidities are comparable with one another, and consequently that "Newtonian" time has, after all, the significance for real life which Bergson refuses to allow.

There has been much discussion in philosophical quarters of Bergson's place in the classification of philosophers. William James, in his latest works, claimed him as a pragmatist; and it has been maintained on the continent of Europe that his doctrine is not only a form, but the one really coherent form, of pragmatism. There is, of course, a real affinity between Bergson and the pragmatists, which rests on their common distrust of the intellect. On the other hand, whereas pragmatism, at least in its inception, made it a fundamental point to insist on a pluralistic theory of the world, Bergson's doctrine of the *élan vital* is definitely singularist. Thus he touches Bradley on one side of his doctrine as closely as he touches James on the other. In fact, the complaints which pragmatists used to make a few years ago of the miraculous feats ascribed by "idealists" to the Absolute might easily be urged *totidem verbis* against the *élan vital*. According to another view, Bergson is most correctly described as a "mystic," though he can hardly be called so if the word is used with any precision. Mysticism is primarily not a peculiar way of thinking but a peculiar way of being. What the great mystics of the past have aimed at is first and foremost a transformation of human character by which it becomes responsive to stimuli from a "transcendental" world, inaccessible to ordinary perception. Since no such transcendental world is recognized in the Bergsonian scheme, it seems merely misleading to speak of his philosophy as mysticism.

A second feature of the philosophical movement in the earlier days of the decade was, in Great Britain and America, the rise of the so-called "New Realism." This also may be regarded as a conscious reaction against the idealistic doctrines of the last generation which go back for their inspiration to Fichte and Hegel, but it was a reaction which was in many ways the direct antith-

esis of the movement represented by Bergson. The new realism, though it manifested itself in a great variety of forms, was in all its various guises definitely intellectualistic. This was shown by the general dissatisfaction of its representatives with the Kantian strain in the thought of their older contemporaries. What is particularly objected to, as the source of "idealistic" or "mentalistic" fallacies, is the Kantian view that both sense, in virtue of the pure forms of intuition, and thought, in virtue of its scheme of categories, are in part constitutive of the objects they apprehend. The tendency common to all the writers who may be classed together as typical of the latest forms of realism is to regard both sense and thought as simply apprehensive of data which do not depend on the percipient mind, either for their existence or for their apprehended qualities and relations. The degree of consistency with which this doctrine is held varies with its individual representatives, but, thought out consistently, it plainly tends in the direction of ultra-intellectualism, since it leads to the view that the specific task of philosophy is simply to apprehend as completely as possible objects and relations which exist and have the characters which they are discovered by science to have quite independently of the perceiving or knowing mind. On the psychological side this tendency shows itself in its extreme form in the doctrine that known relations between objects are purely non-mental, not the "work of the mind," as T. H. Green had taught. The function of the intellect is not to create relations between its objects, but simply to discover what the relations between them are. On this point there seemed to be general agreement between such writers as Alexander, Russell, and Moore in England, Woodbridge, Fullerton, Montague and others in America, and Couturat in France. It is a natural development of the same view that the attempt should be made to deny the existence of what are commonly called "presentations," and to hold that in sense perception we have only two distinguishable factors, an extra-mental presented thing and the process of apprehending it. Presentations, *i.e.* mental "contents," which psychologists have usually regarded as immediate objects of cognition from which we may go on to infer propositions about the extra-mental things which are their exciting causes, are then dismissed as unnecessary fictions. This is the point of view adopted by Prof. Alexander, according to whom there are, strictly speaking, neither contents of cognition nor cognitive states or processes. The contents of the mind consist solely of conations of various types, and the universe is thus reduced to conative tendencies and the objects in which they terminate and find their satisfaction.

This extreme view, that presentations had no existence, was not shared by all the writers who exhibited the realistic tendency. Thus, in his *Problems of Philosophy* (1911), Mr. Bertrand Russell maintains that apart from the general predicates of things and the relations between them, which are universal and must not be said to *exist*, what we know is composed of minds, physical things and sense-data, *i.e.* what are more usually spoken of as sense-qualities: red, sweet, salt, and the like. Sense-data are neither mental (processes of consciousness) nor physical. We are *acquainted* directly with our own minds and also with sense-data. But we have no acquaintance either with physical things or with minds other than our own. Any knowledge we have of the minds of others or of physical things is merely knowledge by *description*, and its possibility depends on the truth that things with which we have no acquaintance can be indirectly known if it is possible to describe them in terms of sense-data with which we have acquaintance. Since Mr. Russell accepts the familiar arguments against the physical reality of sensible qualities, it follows on his theory that we have no acquaintance with physical things. I know a physical thing only by inference, *us, e.g., "the cause of such-and-such a definite group of sense-data."* This is a description obtained by a combination of sense-data which I know at first hand by acquaintance with the universals "the" and "cause of," and with these universals I have also immediate acquaintance. My acquaintance with the meaning of "the" secures that the otherwise unknown physical thing signified by the descriptive phrase shall be strictly individual.

Thus my knowledge through sense-data of physical objects is like the knowledge I have, *e.g.* about the "magnates of the Education Department," when I know that there is such a body, and what it does, but have never met any of its members. For science, the most important point in the theory of knowledge is that we can be directly acquainted with relations and universals, though these entities do not properly exist. Immediate knowledge of this kind is what we mean by *a priori* knowledge, *i.e.* knowledge which does not involve awareness of any proposition about what actually exists. As the principles of inference are among the relations with which we have acquaintance *a priori*, we are able to have a derivative *a priori* knowledge of all truths which are deduced by correct inference from *a priori* principles with which we are directly acquainted. This covers the whole domain of the sciences of logic and pure mathematics, as, contrary to the Kantian opinion, all pure mathematics can be shown to consist of propositions deduced logically from premises which involve only logical concepts and relations with which we are directly acquainted. It is added that we must also include under *a priori* knowledge our direct acquaintance with the relative intrinsic worth of various goods. This is why there can be a science of ethics. The chief special work of the particular type of realism represented by Mr. Russell and his associates was done, in close connection with the earlier work of mathematicians like Peano and Frege, in the field of mathematical logic, with a view to the exhibition of pure mathematics as a vast body of deductions from the principles of the logic of relations, first treated with due elaboration in the third volume of E. Schröder's *Algebra der Logik* (1895), and applied with particular thoroughness to arithmetic in Frege's *Grundgesetze der Arithmetik* (1893-1903). The *magnum opus* of Messrs. Whitehead and Russell, *Principia Mathematica*, represents the fullest development of logic as a calculus of relations. The most brilliant account of the principles and methods of the mathematical logicians is, perhaps, that of Couturat (*Principes des Mathématiques*, 1905).

Russell and also G. E. Moore made some application of their doctrine to ethics (see G. E. Moore, *Principia Ethica*, 1903; *Ethics*, 1912; and Russell, *Philosophical Essays*, 1910), but without any very satisfactory results. From their point of view the principal business of ethics is to discover true propositions about the relative intrinsic worth of different "goods." As both writers assume that there are a plurality of such propositions, and that each of them is known *a priori* independently of the others, the impression they leave upon a reader not previously committed to their theory is that they have really no better standard for determining the worth of various goods than their own personal preferences. It is characteristic of both writers that they assume without serious inquiry that *conduct* can only be good in a derivative sense as leading to the production of some good other than itself. Hence, though both reject the older forms of utilitarianism as ascribing a fictitious worth to pleasure, their own doctrine is itself utilitarian in its general character. Beyond discovering true propositions concerning the relative worth of goods, ethics seeks to furnish rules of right conduct, *i.e.* conduct which produces good results, but these rules are always of the most rough-and-ready sort and constantly require modification to suit special cases. Hence the ground is left open in practice for an enormous development of reflective casuistry. Messrs. Moore and Russell have furnished us with some acute observations on the relative goodness of various objects, but because of their refusal to look at human life as a whole they cannot be said to have advanced the study of ethics as an interpretation of life. In their ethical writings, slender as they are in bulk, one cannot see the wood for the trees; they are too much occupied with the search for true propositions about "goods" to develop a satisfactory theory of "the good."

Besides the irrationalism of Bergson and the atomistic intellectualism of the new realists, one may mention as characteristic of the years preceding the World War a third tendency, which held in some respects a middle place between the former two. This was the revival of philosophical Theism, in connection with which important work was done, especially by Prof. James

Ward, Dr. Rashdall and Prof. Bernardino Varisco. Ward and Varisco agree in refusing to accept the unfavourable verdict of pragmatism and Bergson on the worth of the intellect in philosophy, and are so far pronounced rationalists as to require of any philosophical theory of the world that it should be able to justify itself before the bar of reason; neither is, however, an "intellectualist," since neither ascribes to cognition a primacy in importance for the philosophical interpretation of the world over feeling and conation; and both admit, like Kant, our right to believe what we cannot demonstrate, provided that such belief, if accepted, would form the natural completion of the conceptions to which strictly logical analysis of the contents of science points. Both hold in common with Bergson and the pragmatists the reality of contingency and the production of the genuinely "new," but both deny that there is anything irrational or repugnant to the intellect in these conceptions. Ward's views find their development in his *Realms of Ends* (1911), Varisco's in *I Massimi Problemi* (1910) and *Conosci te stesso* (1912). Both thinkers show very markedly the influence of Lotze, whose final results in the main agree with theirs; Ward is, on the whole, Kantian, Varisco Leibnizian in manner.

Ward's starting point is afforded by the contrast between the unity which thought demands of its world and the apparent plurality which meets us in the world of sense perception. The problem which philosophy has to solve is, according to him, on what lines the world of experience can be thought of as one without our ceasing to recognize that it is also truly many. The history of the post-Kantian "idealist" schools has demonstrated that the problem is insoluble if we attack it from the side of the "one." Since the world of perception is not primarily given to us as one but as many, we have to start from its given multiplicity and work toward such a final conception of its unity of plan as our data will permit. Ward thus begins by a tentative inquiry how far the metaphysical assumptions of pluralism will allow us to recognize the experience-world as exhibiting unity. This leads him, *inter alia*, to a brilliant criticism of the concepts of mechanism and "evolution" as they figure in singularist philosophies. The result of the criticism is much that of Bergson's critique of the "geometrical" bias ascribed by him to the intellect. A mechanistic monism must reduce "evolution" to a process by which things unfold what has all along been in them in an "incapsulated" form; but the process known to genuine science by the unhappy name of evolution is really more properly "epigenesis," the growth of the qualitatively new, and therefore unpredictable, out of the old. Starting with an original pure pluralism which resolves the course of things into interactions between agents, each of whom is independent of any other, we can see that a pluralistic universe would develop a tendency to unity in the very process by which its members establish a *modus vivendi* among themselves, but it is uncertain whether such a tendency would give us the amount of unity we presuppose in the real world when we assume the validity for it of general laws, and it certainly does not warrant our ascribing to it such a unity as would justify the belief that the universe is such as to permit the realization of our moral and spiritual ideals. If, however, the pluralist should modify his hypothesis by regarding one member of his universe as a God from whom the rest derive their real but dependent existence, we could find in the existence of such a God good ground for faith in the persistence of spiritual life after bodily death, and the final victory of good over evil; the alleged difficulties of Theism, in particular the alleged impossibility of reconciling the goodness of God with the presence of evil in His world, have no conclusive force. Thus we are free, as Kant held, to exercise a reasonable faith in God and in immortality; and such a faith, while meeting the demands of morality and religion, involves no breach with the intellect, as it amounts only to a further step along the road which the pluralist is forced to tread in accounting for the presence of even so much unity of plan as he has to admit in the visible world.

Varisco reaches a very similar position as the result of a polemic against the empiricist metaphysics of the ordinary Comtist. He begins with an analysis of the actual moment of sense per-

ception. The objects apprehended in such perception stand at once in two sets of relations. On the one hand, they are connected in various ways with one another, and as so connected they form a system which lies open to the perception not only of the special "I" who speak of apprehending them, but to the perception of innumerable other beings, each of whom can equally say "I apprehend" them. Considered from this point of view the system of sense-data and their interconnections may be said to form the common perceived world of mankind at large. But also a given sense-datum which I apprehend is, at the moment of its apprehension, present along with experiences (feelings, conations) which are intimate and private to me and directly accessible to no other being which calls itself "I." In this sense the perceived objects may be said to be *my* objects. Thus there is a sense in which the whole world of fact to which the individual has to adjust himself in action is inseparably bound up with the individual's inner life. Varisco develops this idea in a way which may remind us strongly of T. H. Green, but is at least equally reminiscent of Leibnitz, the one great philosopher whom Green persistently misunderstood. It is fatal to the empiricist theories which regard the "external world" as simply given in sensation that the world reveals itself to science as a complicated network of relations between terms, and neither the universals which pervade it nor some at least of the terms they connect are sense-data. The universals are apprehended by thought, and the self to which they are known, the only thing which we apprehend directly as it is, is also no sense-datum. It is our immediate non-sensuous apprehension of the self which owns its "states" that supplies us with our standard of real Being. Hence Varisco is led to postulate as indispensable factors in the scheme of the universe not only the sense-data and the system of relations between them, but the plurality of persons whose sense-data they are and whose thought apprehends their complicated relations. From these considerations follows the reality of freedom and contingency. For each individual has its unique qualitative character, by which it is distinguished from every other, and the course of phenomenal events thus depends on two factors, the unique characters of individuals and the universal relations between them, and the former factor is obviously incalculable with certainty just because it is what is not common to two or more individuals. Hence the actual course of things is only partly calculable, and this admission of contingency, or spontaneity in the individual, involves no breach with the principle that it is for philosophy to satisfy our intellectual demands. We may call the element of spontaneity a logical (since logic is concerned solely with the universal laws of interconnection and interaction), but not irrational.

At this point arises the supreme issue for a philosophical interpretation of the universe, an issue which is one of value or worth. The question is whether we regard the principle of organization in the universe as immanent, and manifesting itself in an endless succession of individuals which are all transitory; or whether we are to think of it as itself a transcendent individual, and of the finite individuals in which it exhibits itself as permanent factors in the universe. In the former case, the values of the individuals will be all relative, and there will be no meaning in attaching value or purpose to the world-order itself, as it is only the individual which properly has either; in the second case, there will be a meaning in regarding the values we ascribe to human personalities as absolute, and we shall be able to ascribe value and purpose to the universe as a whole, no less than to its various members. Varisco's view is that philosophy as such cannot decide this issue between an impersonal immanent principle of order and "the traditional Christian conception of God." Our decision will turn upon the intensity of our faith in the correspondence between the order of facts and our spiritual ideals. His own preference is for the Christian solution, as an expression of personal faith.

In the sphere of ethics, the attention of modern philosophers of all schools has seemed to be more concentrated on the inquiry into the presuppositions and methods of science than on the interpretation of our inner life. "*Erkenntnistheorie*" is more

in the fashion than "discourses on conduct." This is, as has always been the case, specially true of the work of the Neo-Kantians. Special notice is perhaps due to the important volume, *Substanzbegriff und Funktionsbegriff* (1910), by the distinguished Neo-Kantian writer, E. Cassirer, which is specially valuable for its insight into the real character of the universals, or laws, of exact physical science, and for its criticism of the work done on the philosophy of mathematics by distinguished "new realists." In the sphere of "philosophy of religion" one may perhaps give special commendation to Evelyn Underhill's brilliant attempt to make a thorough study of the meaning and worth of the mystic "way of life" (*Mysticism*, 1910), as well as to the important and elaborate restatement of the principles of "idealism," with special application to the problems of religion, by Prof. B. Bosanquet in his *Principles of Individuality and Value* (the Gifford Lectures at Edinburgh for 1911) and its sequel, *The Value and Destiny of the Individual* (Gifford Lectures, 1912).

It was not much easier in 1921 than it might have been in 1910 to detect a single main stream of tendency in latter-day philosophical thinking. Perhaps, however, it may be said that some of the issues were slowly clarifying. Except possibly in Italy, where the Hegelian influence was marked in the work of Croce and Gentile, "absolute idealism" of the Hegelian type seemed to be losing ground. The veterans of the movement continued to produce impressive work. (It may be sufficient to mention, in addition to B. Bosanquet's two volumes, F. H. Bradley's *Essay on Truth and Reality*, 1914, and J. M. E. McTaggart's *The Nature of Existence*, vol. 1, 1921.) But, at least outside Italy, the school no longer seemed to attract recruits among younger men. "Pragmatism" (or "Humanism") seemed also, since the death of William James, to have taken its place definitely as a movement which had "done its do," and Bergson to be on the way to that canonization as a "classic" which means, among other things, that the canonized is felt to belong to the past rather than to the present. Nor had the philosophy of pure mathematics produced any work of absolutely first-rate importance since the third volume of the monumental *Principia Mathematica* of Whitehead and Russell. In 1920-1 the remarkable developments given to the doctrine of "Relativity" in physics by Einstein and others seemed to have caused a displacement of the centre of gravity of "epistemological" discussion. For some time to come the most topically interesting problem for the "epistemologist" and the metaphysician was likely to be the evaluation of the new physical ideas from the standpoint of general philosophy, and perhaps the most significant fact in quite recent philosophical literature in the English language was the impression which had been produced by Whitehead's two remarkable volumes, *Principles of Natural Knowledge* (1919) and *The Concept of Nature* (1920). The future would show whether these works might not give rise to a new and brilliant *Naturphilosophie* with marked affinities to Plato in the *Timaeus* and to Berkeley. For the present, physics seemed likely to occupy the same sort of central position in philosophical speculation which mathematics had held since 1900.

As far as could be discerned in 1921, the main directions in contemporary philosophy seemed to be three.

(1) Theism of a strongly ethical kind with a metaphysical basis of "monadism" or "personal idealism" and definitely hostile to that depreciation of human individuality which was common among the religiously minded idealists of the latter part of the nineteenth century. The theists of this type commonly call themselves "idealists" and hold fast to the conception of a real unity of the world of persons in a supramundane God, whom the world would not refuse to speak of as "personal," though some of them would hesitate to call him a "person." Striking examples of valuable works from this standpoint are James Ward's *Psychological Principles* (1918)—the most philosophical treatment of psychology so far produced in Great Britain or perhaps in Europe; W. R. Sorley, *Moral Values and the Idea of God* (1918); A. S. Pringle-Pattison, *The Idea of God* (1917); C. C. J. Webb, *God and Personality* (1918); *Divine Personality and Human Life* (1920).

(2) "Neutral Monism" in its various forms, all agreeing in the attempt to deny that disparateness of mind and matter upon which Descartes taught modern philosophy at its very inception to insist, and the desire, speaking generally, to reduce the importance of mind, "consciousness," "the subject" in the scheme of things, to a minimum. This tendency has, perhaps, been most marked in the United States of America, where it has given rise to a whole school of young metaphysicians calling themselves "New Realists" (in contradistinction from the older realists of the Aristotelian tradition) and has been carried into psychology, with some exaggeration of its distinctive point of view, by the so-called "Behaviourists."

In Great Britain the same tendency has been shown in the later work of B. A. W. Russell, but its most striking product was perhaps S. Alexander's *Space, Time and Deity* (1920), where the principles of "New Realism" are combined with the speculations of Minkowski, Einstein and others on "Relativity" in an attempt to take stock of the universe and its contents. As the result is to represent these contents as an hierarchical order in which mind, however low its real rank, at least holds the highest rank with which we are acquainted, it is perhaps not unfair to say that, in Mr. Alexander's construction, relativity is at any rate "relatively" more prominent than "new realism." There is a certain community of temper between the work of the "New Realists" and one or two important works on special topics which do not commit themselves unreservedly to any metaphysical standpoint, though they may fairly be said at least to be not "idealistic," such as C. D. Broad's *Perception, Physics and Reality* (1914) and J. Laird's *Problems of the Self* (1917). J. Laird's later work, *A Study in Realism* (1920), is much more decidedly in line with the "new realism," though (as might be expected from an author whose earlier book was chiefly notable for the vigour with which it defended the position that the self, while unquestionably real, is neither the body nor any part of it) free from the tendency of many "new realists" to depreciate the importance of mind in the scheme of things.

It was as yet too early in 1921 to feel sure what the value of this revival of "realism" was. As against the older tendency to regard Nature as very largely the creation of the human mind and, in fact, something of an "illusion" which happens unaccountably to be shared by every one, it may fairly be said to be largely justified, and it seems also likely to prove a serviceable ally to the moralist who believes in "objective" obligation against the perennial endeavour of the mere anthropologist to confound moral distinctions with capricious "personal" likings and dislikes. It is a strong point of the doctrine that it refuses to regard the universals of science and ethics as "figments" (like the older sensualism), or (like Kantianism) as "creations of the mind." They are genuinely there "in the facts," and have to be accepted no less than the deliverances of sense as "part of the facts." In so far as the "realistic" tendency seems likely to deliver us in natural philosophy from the belief in a "material substrate" and the rejection of the wealth of "sensible qualities" to the realm of illusion, and in ethics from the theory that moral values are purely "subjective," it promises to do admirable work for the clarification of thought. But it may be suspected that some of the protagonists of the movement are too much in a hurry to philosophize with due discrimination. The "neutral monism" to which they seem to tend in metaphysics is no new thing, and one may doubt whether it really deserves to survive its drastic criticism by J. Ward at the end of the last century (*Naturalism and Agnosticism*, 1899). It seems probable that some of the dialectical victories of the "realist" are easily won by substituting the alleged dualism of matter and mind for the very different duality of knower and known. To deny that the universe consists of two classes of substances, radically distinct and disparate in all their properties, is one thing; to maintain, as some, if not all, "new realists" do, that minds might disappear from the universe and yet leave it with all its colours, tones, odours, perhaps with all its "values," unaffected is quite another. Reference to the "subject" of knowledge may be irrelevant to the discussion of particular problems in nature precisely because

the "subject" is equally relevant to the whole of Nature. To the present writer, at least, it seems that none of the "realists" of the moment has so clear an insight into the real significance of the "subject" and the real character of "Nature" as was shown long ago by John Grote in his remarkable, but unfortunately not very readable, work *Exploratio Philosophica*.

(3) The third tendency which calls for note is what one may call "Spiritualist Pluralism." According to this view the universe consists in the end of a vast plurality of minds, but there is no one central and supreme mind controlling its destiny. Anti-materialism and atheism are thus conjoined. The view itself is, indeed, not a new one. It has been long upheld, as an interpretation of Hegelianism, by J. M. E. McTaggart, and is, of course, not so very different from the "theism" of those "personal idealists" who make a point of objecting to the traditional doctrine of the Divine Omnipotence. But the pluralistic universe of spirits, as conceived by these thinkers, is, of course, an orderly one. The believers in a "finite God" have always stipulated that the limits of their Deity's knowledge or power shall be so widely drawn as to leave Him in a position to act as an overruling Providence to the rest of us. McTaggart's scheme does not include a God at all, but, for reasons which he has, perhaps, not made fully apparent, he is persuaded that it is in the nature of spirits to fall into line with one another and even to advance inevitably by a natural law to complete fruition of perfection and happiness. His world, to use an illustration of his own, is like the senior common room of a college without a master. (Have we here a last vestige of the old, comfortable Godwinian dogma of the "perfectibility of human nature"? There is a distinct flavour of the 18th-century optimism, against which *Candide* was a protest, about this metaphysic. The times of violence, it is taken for granted, lie behind us in the dim past; "culture" and "enlightenment" are a sufficient guarantee against their return, exactly as was thought by those representatives of the French *noblesse* who came up to Paris for the meeting of the States-General in 1789.) Naturally enough, the events of the recent years of world-wide war (1914-8), which made even the most optimistic feel how very insecure the foundations of our "moral civilization" are, were not favourable to spiritualistic pluralism of this easy-going and cheerful kind. Aerial bombardments and poison gases brought it home to all of us that the world is as "dangerous" as Nietzsche could have wished it to be. But an anarchic version of spiritualistic pluralism was enunciated with great vigour at the end of the war by the brilliant Italian philosopher, A. Aliotta, who had formerly professed a theistic "personal idealism," in his small but striking manifesto *La guerra eterna ed il dramma dell' esistenza*. According to Aliotta, what the "real world" of spirits resembles is not a college in the long vacation but one of the fronts of the recent war. Spirits are ingenerable and indestructible, and their life is an unending warfare for incompatible ideals. The issue of the conflict is unknown and unknowable, and, indeed, it is just the fact that it is unknowable which makes the fight worth while. It seems even to be held that good would not really be good unless there was some one to hate and resist it. *Arma amens capio nec sat rationis in armis*. Aliotta, in his later phase, rejects Theism with disdain. His reasons appear to be primarily ethical. If there is a "God above," it is argued, we know already that the issue of the secular warfare of good with evil is decided. Good is going to win and we know it; the battle is thus as good as over already, and there is no more heroism in playing a man's part in the world than there is in charging an unloaded battery on a day of field manoeuvres. Aliotta's zeal and energy have created, apparently, a whole band of enthusiasts for a pluralism of this kind among the younger Italian philosophers. The weak points in the intellectual construction are, however, obvious. The alleged ethical objections to Theism only hold good on the assumption that Divine Providence is absolutely incompatible with human freedom, and no serious attempt is made to justify this assumption that Theism means hyper-Calvinism. That in a theistic universe good will be triumphant "in God's good time" may be certain, but it does

not follow that it will triumph without our efforts or that it does not depend largely on us when that "good time" shall be. Again, it must not be forgotten that the Theist does not commonly profess to be able to demonstrate his creed with mathematical certainty. He lives by faith and hope and usually professes to *prove* no more than that the scheme of things leaves him room to hope. It is probably impossible to reason an intellectually alert but morally frivolous man into belief in God. Still more unreasonable does it seem to hold, as Aliotta and his followers sometimes appear to hold, that the very meaning of "good" is "something which one has to fight for." If this were so, evil would clearly become very good if it were so generally hated by most men that its partisans were compelled to fight very hard on its behalf. It must always be more than a meaningless form of words to ask the question: "Is what you propose to fight about worth fighting for?" To put it differently, the proposition "that for which I am fighting is good" is always a synthetic proposition in Kant's sense of that phrase.

The years from 1918 to 1921, at all events in Great Britain, seem to have been rather barren in works of practical philosophy of outstanding importance. There were, of course, many reasons for this: the disturbance, by the war, of the ordinary avocations of the class by whom such works are chiefly produced, the rise in the cost of living which lowered the demand for books, and above all the great increase in the cost of paper and labour. Mention should, however, be made of one admirable work, L. T. Hobhouse's, *The Metaphysical Theory of the State* (1918). Hobhouse's work is a hostile criticism of the Hegelian tendency to deify the State as a sort of "super-person," which he takes as exemplified by B. Bosanquet's *Philosophical Theory of the State*, and a reassertion of the traditional "liberal" conception of the State as a system of machinery for the promotion of the welfare of individuals. The criticism of the Hegelian adoption of Rousseau's conception of the "general will" is severe but illuminating. It may be that Hegelianism tends to make men conservatives (though our own Hegelians have as often been socialists), and that Hobhouse's personal political inclinations at times run away with him. He seems so convinced of the antecedent probability that any governmental enactment will be a bad one as almost to hold that any "rebel" (a Marat or an Hébert?) may be presumed to be in the right until it is proved that he is in the wrong. But in view of the dangerous tendency of present society to "look to Government" for everything, and of the serious moral abuses to which the metaphor of the "personality" of the State may lead when it is taken to be more than a metaphor, the book must be regarded as a singularly timely contribution to philosophical politics.

In pure logic perhaps the most important English publication of very recent years has been the issue in 1921 of the first volume of W. E. Johnston's long-expected *Logic*. Mention should also be made of B. Bosanquet's *Implication and Linear Inference*, a welcome appendix to the more voluminous logical work of the veteran philosopher which throws a good deal of fresh light on his fundamental position.

The years of war and uneasy reconstruction have not been barren of useful work in the history of philosophy. In N. Kemp Smith's *Commentary to Kant's Critique of Pure Reason* (1918), we have at last in English an adequate historical and exegetical companion to the most famous of all German works on metaphysics and the theory of knowledge which will be indispensable to all serious students and may take rank with anything which the Germans themselves have done for their illustrious philosopher. If Smith's work is not quite on the gigantic scale of Vaihinger's great German commentary, it has the advantage of covering the whole of the *Critique*, whereas Vaihinger breaks off at the end of the *Transcendental Aesthetic*. In all other respects the British commentator may fairly sustain comparison with his Continental predecessor. Another very welcome contribution to the history of modern thought is J. Gibson's *Locke's Theory of Knowledge* (1917), which should do a great deal towards making the real greatness of Locke as a rationalist philosopher clear to his countrymen and dispelling the strange conception of him as

a sensationalistic empiricist made current among us in the 'seventies of the last century by T. H. Green's *Introduction* to the Green and Grose edition of Hume. It were much to be wished that some competent scholar would do for Hume, a philosopher who has been no less strangely misunderstood, what Gibson has done for Locke. We still need to have it established by a really historical study of the *Treatise* and the dialogues on *Natural Religion* that Hume was neither an empiricist, as Green would make him, nor a positivist, as Huxley represents, but precisely what he calls himself, an "academic or sceptical" philosopher, and that the true measure of his intellectual greatness can only be taken when this simple fact is kept steadily in mind. A gap is also filled in our philosophical literature by the appearance of W. R. Sorley's *History of English Philosophy* (1920), which begins with Alcuin of York and carries the story down to the end of the 19th century. The veteran J. T. Merz completed his masterly *History of European Thought*, a work to which it would be hard to find a parallel in its scope and the accuracy of knowledge in many fields which it displays, by the issue of the fourth volume in 1914. He has since given us an interesting addendum, containing an outline of his own philosophical interpretation of experience in *A Fragment on the Human Mind* (1919), where it is interesting to see how profoundly a thinker at home in all the developments of French and German thought has been influenced by our own Berkeley and Hume. The *Fragment* is one of many signs that there is possibly a great future before a really critical Neo-Berkeleyanism. Berkeley received scant justice at the hands of the Anglo-Hegelian "Idealists" of the late 19th century, who seem to have been under the impression that his best-known doctrine was meant as a kind of "subjectivism." The 20th century seems likely, by laying stress on the very real element of "naïf realism" in his work, to arrive at a more intelligent and more generous estimate of its permanent value. We should not omit to chronicle the real service done to philosophical literature by the Open Court Publishing Company in the reissue (1916) of the epoch-making work of Boole on the *Laws of Thought*, the original edition of which had become very scarce. It is a great misfortune, owing presumably to the deaths of Dr. Paul Carus and Mr. P. E. B. Jourdain, that the complete republication of the logical writings of G. Boole and his great contemporary Augustus De Morgan has not been proceeded with. A reprint of De Morgan's *Formal Logic*, his contributions to the logic of relatives, and *Trigonometry and Double Algebra*, if of no other of his works, is badly needed by the student of the history of modern exact logic.

It is gratifying to note that the study of the great Greek founders of science and philosophy is still zealously prosecuted in Great Britain and in other countries, notably in Italy, which has been remarkably fertile in recent years in all departments of philosophical literature. It may be recorded that all through the war the issue of the great Oxford translation of Aristotle provided for by the will of Jowett slowly proceeded, the last part issued up to the middle of 1921 being the revision of Jowett's own version of the *Politics* by W. D. Ross. The Aristotelian student may be excused if he feels a little impatient at the continued non-appearance of just those Aristotelian works which are at once the most interesting and the least adequately represented in English, the *Organon*, *Physics*, *De Caelo*, *De Generatione* and *Meteorologica*. But for these logical and cosmological writings the English Aristotle was in 1921 well-nigh complete. Another most valuable work which progressed steadily after 1914, and in 1921 needed only one more volume to be completed, is the handsome edition of Kant's works with that indispensable *subsidiū*, a full collection of variant readings edited by the eminent scholar, E. Cassirer. If, in binding and quality of paper, the later volumes inevitably fall off to some extent from the high standard of the earlier, this edition is in all other respects what an edition of a great classic ought to be. It was at last possible to read Kant with pleasure to the eye and with full certainty whether what one had before one was what Kant himself actually allowed to be printed or a (good or bad) conjecture of some modern Kant-scholar. We have too long acquiesced, and that not only in

philosophical works, in a standard of textual accuracy where modern writers are concerned which would be rightly deemed barbarous in editions of the Greek and Latin classics. It is to be hoped that this bad practice will not be tolerated much longer by self-respecting scholars.

The changes in the third edition (1921) of J. Burnet's *Early Greek Philosophy*, the most critical and careful study of the beginnings of Greek science, are an interesting indication of the advance our knowledge of classical antiquity had made since 1908. No contemporary work on the primary Greek philosophers is of quite such first-rate importance as L. Robin's important *La Théorie Platonicienne* of 1908, the one modern work which systematically and in detail begins the investigation of Plato's philosophy with the proper initial question, what Plato was understood to mean by men like Xenocrates and Aristotle, who heard his doctrines from his own lips. J. Burnet's *Greek Philosophy, Thales to Plato* (1914) proceeds on similar lines, but the writer is limited by the facts that Plato is only one part of his subject and that he has perforce to give most of his space to the exposition of the dialogues. His actual interpretation of Plato was deferred to his second volume, not yet published in 1921. But Robin had issued a brief but important appendix to his main work, *Études sur la signification et la place de la Physique dans la Philosophie de Platon* (1919). Mention should also be made of the admirable Platonic studies of Adolfo Levi, *Sulle interpretazioni immanentistiche della filosofia di Platone* and *Il Concetto del Tempo nella filosofia di Platone* (1920). These are contributions of first-rate importance to the recovery of the genuine tradition of the first generations of the Platonic Academy. It ought to be clear that it is on the recovery of this tradition, for which there is ample available evidence, that our hopes of definitely ascertaining the real meaning of the first and greatest of all philosophical writers must depend.

The Neo-Thomist movement in the Catholic universities of the Continent still continued, in 1921, to flourish vigorously and to show its vitality in the general excellence of the work in such journals as the Italian *Rivista di Filosofia Neo-Scolastica* and the *Revue Neo-Scholastique de Philosophie* issued by the philosophical faculty of the university of Louvain. Among the actual books produced quite recently by the movement, mention may be made of the brief but highly condensed and valuable study of St. Thomas's thought in its entirety, *Le Thomisme*, by E. Gilson of the university of Strassburg. The English reader will get an admirable introduction to a great philosophy too little known among us by combining the study of this general introduction to Thomism with that of the very sympathetic exposition of Thomist natural theology by P. H. Wicksteed, *The Reactions between Dogma and Philosophy Illustrated from the Works of S. Thomas* (1920). The appearance of works like this last leads one to hope that it might soon be impossible for the average historian of philosophy among us to write as though nothing of any significance had been thought or said in philosophy between Plotinus (or even Aristotle) and Descartes. Two other recent contributions to the study of ancient and mediaeval thought may be mentioned. G. M. Stratton's *Greek Physiological Psychology* (1917) is a painstaking and laudable attempt to edit the important fragment of *Theophrastus de Sensu* with a translation and full explanatory commentary. In *Opera hactenus inedita Rogeri Bacon* fasc. V. (1920), A. G. Steele happily resumed the task, interrupted by the war since 1913, of providing a complete edition of Roger Bacon's writings.

In U. von Wilamowitz-Moellendorf's two large volumes entitled *Platon* (vol. i., 1917; vol. ii., 1919), the veteran German professor makes some interesting and valuable suggestions, but he is debarred from acting as a competent interpreter of Plato partly by complete lack of training in philosophical thought, partly by a habit of treating ingenious guesses of his own about the motives of a classical writer and the circumstances in which his various works were composed as certainties, partly by a curious want of finish in verbal Greek scholarship which makes his long series of conjectural emendations, in spite of a few felicities, into a systematic depravation of the Platonic text.

During the decade, many of the familiar figures of the philosophical world were removed by death. This was only to be expected in the case of octogenarians like Wundt and Windelband and J. F. Brentano, still more in that of a nonagenarian like the Italian positivist, R. Ardigò (1828-1920). In Great Britain there were few losses among the elder philosophers since the death of the nonagenarian, A. Campbell Fraser. Of the elderly, but not old, the United States lost their leading philosopher, Josiah Royce; France, Gaston Milhaud and Émile Boutroux (1845-1921); and Austria, Alexis Meinong. Still more regrettable was the death of men who were still young or in their intellectual prime, as Louis Couturat in France and Oswald Kulp in Germany.

(A. E. T.)

**PHYSIOLOGY** (see 21.554).—Since 1910 increased attention has been paid, in physiological research, to phenomena common to living beings in general, and recent investigation has added considerably to our knowledge and corrected earlier theories.

As distinguished from *Morphology*, the science of the form and structure of living organisms, *Physiology* may be said to be concerned with their activities, chemical and physical. But there can be no hard and fast line between the two bodies of doctrine. A function depends on the way the machine is made. And many provinces of modern research, such as those depending on changes of general form in response to external agents, combine morphology and physiology. For convenience of research, physiology is often divided into *biochemistry* and *biophysics*. But this distinction can scarcely be regarded as a scientific one, since in all vital processes both chemical and physical factors intervene. It is true that some of the problems of the biochemist consist in the elucidation of the chemical nature of vital products, and might be looked upon as the chemical side of morphology; but the methods of investigation distinguish them from those of the organic chemist.

*Animal and Plant.*—There is no real or fundamental difference between the animal and plant organism. Great as may appear to be the external differences between a dog and a tree, when we proceed to examine the physiological factors of which their life is made up, we find that the elementary processes are essentially alike. The most striking contrast, that of movement, does not exist in the simplest members of the two kingdoms. While certain plants, such as algae and bacteria, are motile in some stages, certain polyps and ascidians become fixed in the later periods of their life. Other instances might be given. The difference between the net result of the chemical changes occurring in the green plants and those occurring in animals is due to the presence in the former of the green pigment, chlorophyll, and does not show itself in fungi. By the aid of chlorophyll, the energy of the sun's light is used to build up the carbon dioxide, formed in the combustion of food by all cells, into sugar and oxygen. These again become available as sources of energy to living matter. In this connexion, it may be noted that the work of Willstätter and Stoll has made it practically certain that carbon dioxide and water become attached in some way to the chlorophyll particles, a molecular rearrangement takes place with addition of energy when light is absorbed, a peroxide of formaldehyde is produced, and this is then decomposed into gaseous oxygen and formaldehyde by the agency of an enzyme (catalase). From formaldehyde the higher sugars are readily produced by polymerization. The precise chemistry of the reactions is not yet clear—it may be that formic acid and hydrogen peroxide result from the action of water on the formaldehyde peroxide. In this case, catalase splits up hydrogen peroxide into water and oxygen, while the formic acid is reduced by light (absorbed by chlorophyll) to formaldehyde. However this may be, the final result of the process is that, in the light, green plants take up carbon dioxide and give off oxygen. In the dark, they behave like animals, giving off carbon dioxide by combustion. Such combustion, of course, is actually proceeding in the light also, although obscured by the opposite phenomenon.

*Vitalism.*—Some discussion, not very profitable as far as physiology is concerned, has taken place as to the existence of

a form of energy, or, as held by some, of a kind of directing agency peculiar to living beings. The aim of all physiological experimentation is to express vital processes in terms of physical and chemical laws. We call this "explaining" them. The methods used, moreover, are those of physics and chemistry. Owing to the complexity of the phenomena, we have to be content in many cases with expression in terms of simpler *physiological* laws, leaving the further analysis of these laws to the future. As Claude Bernard pointed out, the laws of physics and chemistry manifest their action in systems of a special kind, differing from those familiar to workers in the former sciences, so that the separation of a biological group is quite justified. At the same time, there is intimate connexion and overlapping, a process subject to continual increase.

As to the existence of a peculiar form of "vital" energy, it is to be admitted that we have no direct method of measuring the energy contained in a given mass of carbon and oxygen, although we know that a definite quantity of work can be obtained by allowing them to combine. Thus, the energy of living things cannot be looked upon as altogether peculiar. Indeed, measurements of any form of energy are usually made by converting them into other forms. The first law of energetics tells us that this is permissible. The striking fact that any organism behaves as a unified and coördinated set of activities has led to the assumption of a directing agency of some kind. We shall see later that notable progress has been made in the explanation of the factors responsible for many aspects of this integration.

The position of consciousness in physiological processes is by no means clear. While it may be held that the province of physiology is to investigate what can be made out experimentally in the nervous centres, it does not seem impossible that consciousness may ultimately fall into place as one of the functions of nervous tissue.

*Relation to Physical Chemistry.*—One of the most striking aspects of the development of modern physiology is the important part played by considerations derived from physical chemistry. The osmotic pressure of solutions, the action of the various inorganic ions arising from the electrolytic dissociation of salts, acids and bases, especially the hydrogen ion, and the maintenance of the neutrality necessary to the normal function of the cell, together with the properties of matter in the colloidal state and of heterogeneous systems in general may be mentioned. The absorption of substances at the surfaces of contact of phases that do not mix has been found to explain many otherwise puzzling facts, and is doubtless a prominent factor in the formation of the membrane covering the surface of cells in general and regulating the passage of dissolved substances into and out of the cell protoplasm.

This is perhaps the most appropriate place to refer to the relation of vital processes to the second law of energetics. In one of its aspects, this law points out how the transformation of heat energy into other forms is limited, owing to our conditions of existence being at a temperature so far above absolute zero. The properties which we recognize as "vital" are especially manifested during the change of one form of energy into another. In this process, it is of much importance from the point of view of economy that the free chemical energy of our food should not be "degraded" to heat before utilization in muscular work, and so on. Similarly, the energy of the sun's light must be converted to chemical energy by the green plant as directly as possible, without passing through the stage of heat. Accordingly we find that arrangements are made to ensure that loss from such causes shall be as small as possible.

*Nature of Protoplasm.*—As usually seen in such organisms as the amoeba or the leucocytes of the blood, protoplasm exhibits the properties of a liquid. It contains numerous particles in Brownian movement, a fact which shows the absence of obstacles holding them in place. This liquid, however, is itself a colloidal solution and can be seen under special modes of illumination to be closely packed with extremely minute particles. Under some states of activity, as in dividing cells or when electrically stimulated, this "hydrosol," to use Graham's word, becomes a

"gel," in which the particles have joined together to form minute closed chambers in which liquid is confined, the whole mass then possessing the properties of a solid. This process occurs when a warm solution of gelatin solidifies on cooling. It will be clear that if protoplasm contains many-formed solid structures, as in highly differentiated cells, together with comparatively little free water, it may be scarcely possible to detect its liquid nature. However difficult it may be to conceive the way in which different chemical processes can occur at different places in a liquid, this must be the case, and suggestions have been made as to the temporary formation of separating membranes or other less mechanical means of isolation. The notion of protoplasm as a giant molecule in the chemical sense, with numerous side-chains of a variety of composition capable of reacting together, is held by but few physiologists at the present time. A view of this kind is contained in the theory of "biogens," to which reference will be made later.

The *cell-membrane* is evidently formed by surface condensation of some constituents of protoplasm. In ordinary circumstances, it is impermeable to salts, to glucose and to amino-acids. But since these substances must obtain access to the interior as foods at certain times, it is clear that the membrane must become more permeable when required. The constituents of the membrane being deposited at the surface owing to their properties of reducing surface energy, the actual chemical composition of this layer must be of a complex nature. It is probably, for the most part, an intimate mixture of fatty substances with watery proteins. These may form two kinds of colloidal systems—minute droplets of fat may be surrounded by a continuous solution of protein, like islands in a sea, or they may themselves run together and enclose droplets of protein, similar to the land surrounding a number of lakes or ponds. The properties of these two systems, as regards the passage across them of materials, will not be identical. Thus, rabbits cannot get through the system of islands, fish can do so; while the reverse will be the case with the other kind of system. Familiar instances of the contrast are well known in the forms of cream and butter. The former is a suspension of droplets of oil in a watery solution, the latter consists of droplets of the watery solution in a continuous medium of fat. The investigations of Clowes have shown how, by the action of electrolytes, particularly of calcium ions, one system can be changed into the other. A difficulty is sometimes felt as to how a membrane which refuses passage to sugar allows visible solid particles to pass through, as can be seen in the amoeba and leucocytes. The explanation lies in the manner in which a needle can be dropped through a soap film without breaking the film. A continuous film of the membrane is formed over the point as it enters and again over the eye-end as it leaves. Thus the membrane is never actually broken. A further point to be remembered in the modifications of the cell-membrane is that, being formed of materials present in the cell, it is an integral part of this and must change in correspondence with functional changes in the cell itself. Thus it appears that it becomes more permeable in states of activity, as in the contraction of muscle and in the secretory process of gland cells. If the surrounding medium itself contains substances that lower surface tension, these no doubt contribute to the structure of the membrane. Such is usually the case in the cells making up the animal body, less so in the plant.

Certain substances, proteins and others, become more or less solidified in the process of concentration in surface films, as Ramsden has shown. This fact must also play a part in the formation of the cell-membrane.

As to the *chemical nature* of protoplasm itself, it seems very questionable whether it can be regarded as a uniform chemical compound. Although proteins take a large share, various other substances, such as the complex fats known as *lipoids* or *lipines*, are important components. All the constituents are interconnected in a highly heterogeneous system, partly chemical, partly physical, of many phases and intersected by semi-permeable membranes forming and disappearing at intervals.

Attention may here be called to the special properties of the *carbon atom* as forming the basis of the chemical changes associated with living matter. Compounds of carbon do not naturally react otherwise than slowly. They are, therefore, subject to ready modification in this respect by the agency of the catalysts called "enzymes." Owing to the capacity of carbon atoms to unite together in long chains or rings of a relatively stable nature, along with the possession of four valencies capable of union with four different groups, we have the possibility of the production of highly complex large molecules. Another property of importance in the carriage of energy is the power of combining with elements of opposite character, such as hydrogen and oxygen. The hydrocarbons give up energy on oxidation, while the carbon dioxide can be reduced and built up again by addition of energy to form stores of potential energy for future use.

Although such large complex molecules are of great importance, the view of the essential nature of protoplasm as a further growth

of the chemical molecule, the "biogen" hypothesis, cannot be accepted. According to this view, food material is combined chemically, as a side chain, with a giant molecule, while certain other side chains consist of oxygen. In oxidation, to give energy, combination takes place between these side chains. It follows from such a view that oxygen must be stored up in living cells in an "intra-molecular" form. Now, investigations from many points of view have failed to obtain evidence of the existence of such reserve oxygen. There is no proof that an organism possesses any store of oxygen beyond that contained in the lungs or dissolved in the fluids. It appears that the mechanism of living matter is more analogous to that of a petrol engine, in which the fuel does not form part of the structure previously to its combustion, but that this combustion takes place in intimate relation with the moving parts and that it is owing to the special arrangement of these that the chemical energy of the fuel is converted into the mechanical energy of motion. It is true that such cells as those of muscle and secreting glands have been shown to prepare during rest a store of some kind of system possessing potential energy, ready for use on stimulation to activity. But the process of conversion of this system to one of lower energy content is not associated with the consumption of oxygen or evolution of carbon dioxide. Thus the system is not comparable with a "biogen" and may probably be rather of a physical than a chemical nature. The energy necessary to form it is obtained by the combustion of some food material, apparently carbohydrate, with the giving off of carbon dioxide and involving some loss in the form of heat. The state of activity and the actual combustion process are therefore separate phenomena and the conception of giant molecules throws no light on their nature. It is rather as if the combustion of the fuel in our petrol engine were used, through some mechanism, to pump water to a high level, from which the energy could be obtained by allowing it to run down when required.

*The Nucleus of the Cell.*—Although this component is present in all the more highly organized cells, it is obvious that it cannot be essential in this actual form. Bacteria, for example, do not appear to possess a nucleus, although the materials out of which it is made are probably present distributed through the cell. If, as Morley Roberts suggests, the nucleus is a store of enzymes, the tools of the cell, it might be supposed that, in the absence of the nucleus, these tools are not kept in a special receptacle. Although statements have been made that oxidative processes are especially carried out by the nucleus, the evidence is unconvincing.

The nucleus undergoes a remarkable series of changes in the course of the subdivision of one cell into two daughter cells. This process, known as "karyokinesis" or "mitosis," exhibits a complex play of directed or polar forces. The inheritance of the Mendelian characters of organisms is conveyed by the nuclear constituents. The general characters are held by some to be transmitted by the cytoplasm. But, although it is difficult to believe that the cytoplasm plays no part, it would appear that if all the general characters are thus carried, those of the male parent would be practically unrepresented, since the spermatozoa are almost devoid of cytoplasm. Further evidence is needed.

When a nucleated cell is cut into two parts, one alone containing the nucleus, this part can continue to exist, whereas the other part degenerates and dies. Thus, the nucleus is essential to the life and growth of a cell in those cases where it has become a specially differentiated part. The fact is particularly manifest in the case of the cells called *neurons*, which make up the nervous system. Here there is a very long fine fibre arising from a nucleated mass. This is a "nerve-fibre," and if cut away from its nucleated origin, it degenerates and ceases to be able to conduct nerve impulses.

*Nutrition.*—During 1910-21 much attention was given to problems of the phenomena of nutrition, necessitated in great part by the conditions brought about by the World War of 1914-8. Since the chief use of food is to supply energy and energy cannot be created, it must always be kept in mind that a given amount of food can only provide a certain definite quantity of energy. For convenience of measurement, this is expressed in terms of heat units, calories. An adequate diet must have a certain minimal calorie value, or energy value, differing according to work done, age, weight, etc. Whatever else may be necessary, and whatever may be the composition of the diet, this energy value must be provided. The fact must not be allowed to be obscured by recent work on the importance of special constituents, such as "vitamins" or the presence of particular chemical compounds.

Further, food is obviously required in the growing organism to make new tissue and in the adult to replace wear and tear. Although the actual quantity needed for these purposes is not great, it is clear that it must contain all the chemical elements making up the constituents of the new tissues. There are moreover certain rather complex chemical compounds that must be

supplied, since the higher animals are unable to make them. Nitrogen is needed for the production of proteins, and is in fact taken in food in this latter form, although afterwards broken down into its constituent amino-acids in the process of digestion. A certain minimal amount of protein food is therefore a necessity. When burned, protein gives energy, and might therefore be used for this purpose, if taken in sufficient quantity. But such a proceeding would be costly and wasteful. Accordingly, we make up the greater part of the energy value of our food by non-nitrogenous compounds, fats and carbo-hydrates. The latter appear also to be necessary for proper assimilation of protein. Some discussion has taken place as to the actual necessity of fat, since it has been shown that in the organism fat can be made from carbo-hydrate. Careful experiments indicate that it is not indispensable. Its chief value, physiologically, lies in its high energy value, greatly owing to the very small amount of water contained in the forms used for food.

On account of the fact that the nitrogen of protein appears to be needed only or mainly for the construction of new body substance, there has been a tendency to reduce the consumption of protein. This is advocated chiefly on grounds of economy. Although excessive consumption of this or any food is physiologically harmful, there does not appear to be satisfactory reason for supposing that protein is particularly injurious. On the other hand, it has been stated that a consumption of protein in considerable excess of the minimum requirement is of advantage in conferring greater resistance to infection. Apart from the ill effects of any diet deficient in energy value as a whole, no satisfactory evidence has been brought in support of the statement. It may be said that if any reasonable diet of animal or vegetable structures, including fruit, be taken, it will only be necessary to take account of its energy value. Sufficient proteins and vitamins will be automatically obtained. The dictum of the present writer "Take care of the calories, the proteins will take care of themselves" may indeed be read "Take care of the calories, other things will take care of themselves."

It may be useful to give the composition of the diet put forward by the Royal Society Food Committee as a standard for a man of 70 kilos weight, doing moderate work:

Protein . . . . .	70 grammes = 280 calories
Fat . . . . .	90 grammes = 810 "
Carbo-hydrate . . . . .	550 grammes = 2200 "
Total 3290 calories	

It is understood that this refers to that part of the diet actually utilized and does not include undigested components.

In addition to the above-mentioned, there are certain things which, although they do not contribute to the energy value of a diet, are nevertheless indispensable for the proper working of the cell machinery and the utilization of the material presented to it. Water is needed for the carrying on of chemical reactions and for the conveyance of products from place to place. The colloidal systems of the cell are maintained and modified by salts, especially those of sodium, potassium and calcium. This adjustment, as Macallum has pointed out, is doubtless an inheritance from adaptation to the composition of the ocean in early geologic times, from those inhabitants the present land animals are descended. We find, moreover, certain metals, such as iron, manganese, copper and magnesium, present in small amount in living organisms. We know that iron is a constituent of the red pigment of the blood corpuscles, by which oxygen is supplied to the tissues. In certain invertebrate organisms, it is replaced by copper. Magnesium is a corresponding element in the green pigment of plants, chlorophyll, without which life would come to an end owing to the using up of the oxygen of the atmosphere. Iron and manganese are of importance in the mechanism by which food is burned and its energy obtained. Certain moulds will not develop completely without zinc. It is more than likely that many other metals present in traces are more than mere accidental contaminations. Calcium, as we have already seen, plays an important part in the adjustment of colloidal systems. Potassium, although we know it to be indispensable, presents difficulties. Zwaardemaker maintains

that its importance rests in its radio-activity, but other workers have not been able to replace it by other radio-active elements. Sodium salts, at the present time, serve chiefly to make up the osmotic pressure of the blood and tissue fluids. The occurrence of iodine in the internal secretion of the thyroid gland must not be overlooked.

**Vitamins.**—Not the least interesting of those constituents of a diet whose presence is absolutely necessary, although small quantities suffice, are the accessory food factors called by this name. The name "vitamine" was originally given owing to a mistaken view of their chemical nature. But, since it has come into general use and is conveniently short, objection to it may be removed, as Drummond has pointed out, by omitting the final "e" and using it merely as a name, without implication of chemical structure.

So far as known at present, they are three in number, distinguished by the addition of the letters A, B and C. Vitamin-A is commonly found in association with certain fats, such as butter and cod-liver oil, but it is also present in fresh vegetables. It is essential to normal growth and maintenance and its absence appears to be responsible for rickets in children. Vitamin-B is found in the germ of seeds, such as wheat and rice, but it is widely spread. Its absence from polished rice results in beri-beri, when this food material is the only one taken. Vitamin-C is required for normal nutrition, although the precise manner in which it acts is unknown. In its absence, the disease known as scurvy makes its appearance. This vitamin is much less stable than the preceding ones and is found only, to any notable extent, in fresh fruit and vegetables. Although all of these factors occur in animal products, they are present there owing to the vegetable food taken by animals. Their ultimate source is the plant, since animals are unable to make them. It is more particularly Vitamin-C that is defective in animal products. Fresh meat contains it in a very small amount. Owing to the minute quantities that are physiologically sufficient and are alone accessible for investigation, their chemical nature is as yet unknown. They do not undergo change in the course of their activity, but are excreted or destroyed more or less rapidly. Thus, their activity appears to be of a catalytic nature, but nothing very definite can be stated at present.

The normal growth of plants is also dependent on similar accessory factors. The "bios" of yeast, and Allen's work on diatoms may be referred to here. Bacteria, also, require in many cases special materials, such as haemoglobin, or particular amino-acids, for satisfactory culture.

It should be noted that certain products formed by organs in the body itself have powerful effects on the chemical changes of growth and nutrition. To these "internal secretions" or "hormones" reference will be made below.

**Anabolism and Catabolism.**—It was held at one time that all food materials, previous to further utilization, must be built up into the actual constitution of complex protoplasmic molecules such as "biogens." And that the activities of organs typified by muscular contraction and glandular secretion consisted in the breaking down of such complex chemical individuals. The former process was spoken of as "anabolism" or "assimilation," the latter as "catabolism" or "dissimilation." More recent work has led to a somewhat different point of view, as already indicated above. It appears that glucose, for example, is burned without becoming a part of the protoplasmic structure and, although the energy thus available is used for the storing up of potential energy in some complex system, to be used up in subsequent contraction or secretion, this system may not necessarily be of a purely chemical nature. If the anabolic and catabolic processes are opposite chemical reactions in the sense of the building up and breaking down of the same compounds, it is natural to suppose that while the former process is taking place the latter is *ipso facto* decreased. Hence, the view that the nerves producing a reduction of activity (inhibition) are anabolic in action. Investigation, however, has failed to give confirmation of such a view of the nature of the inhibitory process.

Allied to the above problem is that of the existence of nerves influencing the growth or repair of tissues. Although definite statements cannot yet be made, evidence of any such influence, apart from changes in blood supply, is inconclusive.

**Enzymes.**—These catalytic agents are of great importance in the chemical changes of living organisms. It is generally recognized that they are colloidal and that the reactions accelerated by them

take place on their surfaces. Thus, a preliminary absorption of the components of a reaction occurs preparatory to the actual chemical change. Whether this increased concentration or close approximation by molecular forces is in itself sufficient to account for the effects or whether there is an intermediate compound formed between the material of the surface of the enzyme and the substances to be acted upon is not yet clear. No such compound has been prepared, but its existence may be so brief as to elude detection. It is evident, however, that the chemical nature of the surface of the enzyme particles may be held responsible for the variety of limited and special activities met with amongst these substances. At the same time, it is not to be forgotten that the physical properties of this surface depend on its chemical nature. In this connexion the views of Langmuir on the orientation of molecules in surface layers may be referred to. In regions of molecular forces, no valid distinction can be drawn between chemical and physical forces.

Much discussion has taken place as to whether enzymes have synthetic as well as hydrolytic powers. In the majority of cases we are dealing with undoubted reversible reactions, which attain an equilibrium position other than complete change in either direction. But the two opposite reactions which determine the equilibrium point proceed naturally at a very slow rate. If an enzyme were to accelerate one of these without the other, the equilibrium position would consist in practically complete change in one direction. If this position as reached under the action of an enzyme is anywhere but at the extreme in one or the other sense, it follows that the enzyme has quickened *both* the hydrolytic and the synthetic reactions. Many cases of this kind are now known. The actual position of the equilibrium depends on the concentration of water in the system. Thus, in order that the synthetic activity may be preponderant, arrangements are required by which this concentration of free water may be decreased. This may be effected in the cell by colloidal imbibition by absorption on surfaces, or by osmotic action. If the products of synthesis are rapidly removed either by being deposited in an insoluble form, as for example starch or glycogen are, or by being carried away in the blood stream, the synthetic process may be continuous, since equilibrium is not reached.

*Oxidation.*—As is well known, the living organism is able to burn food materials, such as glucose, fat and so on, which are only oxidized with such extreme slowness by atmospheric oxygen that combustion appears to be absent in many cases. The mechanism by which oxidation is effected in the organism consists in making use by enzymes of products of oxidation of certain materials which are attacked by atmospheric oxygen. Although details of the mechanism are not altogether clear, the main facts are as follows. When a substance, such as an unsaturated fat or lecithin, is oxidized by oxygen as it exists in the air, it is said to undergo *autooxidation*. In this process, *per se* with the formation of the ordinary oxide, which of course affords available energy, a peroxide is formed by the aid of this energy. It appears also from Mrs. Onslow's work that the autoxidation may be hastened by an enzyme, thus affording a larger supply of the peroxide. But while a peroxide in itself has greater oxidizing power than oxygen in the molecular state has, or in other words its oxidation potential is higher, this potential is not sufficiently high to attack glucose or lactic acid. If, however, a small amount of a ferrous salt be added, a catalytic separation of oxygen in an "active" state occurs and such refractory materials as lactic acid are then oxidized (Fenton's reaction). Whether active oxygen is atomic or whether it is in the process of changing its valency, as Ramsay used to teach, is uncertain. The important fact is that we find in living organisms an enzyme, "peroxidase," capable of acting on peroxides in the same way as the iron in Fenton's reaction. Indeed, it seems likely that either iron or manganese is the responsible constituent of the enzyme.

Oxidation or reduction may also be brought about by substances which remove hydrogen from water, thus leaving reactive oxygen. As Hopkins has shown, a sulphur group (S-S) may take up hydrogen to form HS-SH, while this compound in its turn may hand on hydrogen to an "acceptor," and so reduce it.

*Integration.*—Organisms behave as coordinated systems, not as collections of separate cells. There must accordingly be means of inter-communication between all parts. In the animal, the most obvious of these is the nervous system, which makes its appearance at a very early stage of evolution. It may be compared to the telephone system of a city, by which any part can be connected up with any other. This comparison is in many ways an instructive one. Any one subscriber can be put into communication with any other and his line is a "final common path" for messages from various sources. Thus, the nerve supplying any particular muscle is made use of in many various movements, since it can be connected up in the brain with different nerves conveying their respective messages from the sense-organs.

Details of researches on the activities of the central nervous system are beyond the scope of this article. In general it may be said that the conception of a series of alternative parallel arcs at different levels in the hierarchy has shown itself an illuminating one. When the higher arcs come into use, those of lower levels fall into disuse and become relatively resistant to the passage of impulses. These lower arcs still remain potentially active and when the higher parts are removed gradually become functional again, to

a greater or less degree. In some cases, their activity is kept in check by the higher arcs and liable to become more or less excessive when the influence of these is removed. Such "release" phenomena play an important part in the manifestations of the nerve centres, especially in abnormal states.

Pavlov's method of "conditioned reflexes," by which physiological, objective, research on the cerebral cortex can be made, has already led to many valuable results. The part played by inhibitory processes has been shown to be a very important one.

As animals grow in size and complexity, some system analogous to that of mechanical transport by roads or railways becomes necessary. Oxygen has to be conveyed to all parts of the body from the place in which it is obtained from the air. The carbon dioxide and other products of chemical change require removal for the purpose of elimination by the organs devoted to this purpose. Food has to be taken from the alimentary canal to other organs in which it is burned or used for repair. As is well known, it is by means of the blood flowing in a voluminous network of tubes that this aspect of integration is effected. Thus, materials in quantity are carried from one organ to another. As regards oxygen and carbon dioxide, further remarks will be found below.

Much attention has naturally been given to the pump, known as the heart, which serves to keep the blood flowing through the vascular system. The most important recent work is that of Starling embodied in the *Law of the Heart*. It was found that all the responses of this organ to the demands of the circulation, apart from the effects of nervous reflexes upon it, could be explained on the basis of a certain property common to all muscle. This property, which was clearly brought out by the work of A. V. Hill, is that the magnitude of any given contractile effort depends on the length of the fibres when the contraction begins. Hence, the more blood enters the heart during rest the greater is the force expelling it in the next following beat. The property of muscle referred to shows that the source of the contractile stress must be sought in certain surfaces arranged longitudinally or in the direction of the pull exerted. (For recent work on the capillaries, see STUCK.)

But the system of mechanical transport of a town serves to carry letters in addition to materials for actual use as such. The chemical substance of these letters is not utilized, but they contain messages by which a supply of something or other is ordered to be sent from its source to a place where it is wanted. The so-called "internal secretions," "chemical messengers" or "hormones" correspond to the letters of the postal system. These are produced in some organ and carried by the blood to other situations in which they set various processes into activity. Thus, for example, adrenaline is sent out from the suprarenal glands into the blood. Reaching the liver, it causes a supply of glucose to be set free and supplied to the body generally. It has of course, other actions as well. We know many of these chemical messengers at the present time. They are formed in the thyroid, pituitary, pancreas, sex-glands and so on. In one or two cases their chemical nature is known, but for the most part this is not yet the case. It seems very probable that every tissue in the organism has its influence on other tissues. In the culture of tissues under the microscope, a method of investigation which has now reached much perfection, it is found that the growth and differentiation of one kind of tissue is greatly influenced by the presence of other tissues.

In the higher plants, this effect of one part upon another is well shown by the inhibitory effect of the apical growing tip upon the growth of other buds. The work of Child suggests that this effect is of the nature of a protoplasmic transmission of some influence rather than the diffusion of an actual inhibiting hormone, as was supposed by the previous workers.

*Carriage of Oxygen and Carbon Dioxide.*—Although it has been known for some time that it is the haemoglobin of the red corpuscles that carries oxygen from the lungs to the rest of the body, there is still much to learn about the mode in which this gas is attached to the haemoglobin. There are some puzzling phenomena, not the least of which is the fact that we know of no other chemical compound that takes up and gives off oxygen in a way similar to that of haemoglobin. In particular, one which combines with oxygen in proportion to the pressure of the gas up to a saturation point which appears, in the case of the blood pigment, to correspond with one molecule of oxygen to each molecule of haemoglobin. Much valuable work has been done on the relationship referred to, especially by Barcroft and his coadjutors, more especially on the way in which it is affected by changes in the conditions present in the blood and tissues. The problem is one of paramount importance in the life of the higher organisms.

The problem of the carriage of carbon dioxide is in a more disputed state. While some hold that it is effected by the proteins of the blood acting as acids and driving off carbon dioxide from sodium bicarbonate when the tension of carbon dioxide is lowered, others hold that this gas is carried by haemoglobin in the same way in which oxygen is carried. The decision necessitates difficult measurements and is still uncertain.

*Regulation of Reaction.*—Whether the sodium bicarbonate of the blood acts as a carrier of carbon dioxide or not, there is no doubt that it has an important function in preserving the neutrality of the blood. As would be expected from the fact that the various chem-

ical processes take place with the intervention of colloids, they are very sensitive to changes in hydrogen-ion concentration. This is particularly the case with enzymes. The blood contains sodium bicarbonate, which in itself has an alkaline reaction, owing to hydrolytic dissociation, together with carbon dioxide which forms an acid when dissolved in water. The reaction of hydrogen-ion concentration of the blood is thus controlled by the relative proportion of these two constituents, and is normally at a very slight degree of alkalinity. If acid is formed anywhere and passes into the blood, it combines with part of the bicarbonate, driving off carbon dioxide and thus raising the acidity. But the respiratory centre is enormously sensitive to such a rise and removes carbon dioxide by increased ventilation of the lungs until it is reduced to a level corresponding to the reduction of the bicarbonate. It has been held by some that the proteins assist in the process, but it is very doubtful whether this effect is more than very trifling, if present at all.

**Excretion of Waste Products.**—The removal of one of the chief of these, carbon dioxide, has been discussed. The most important of the non-volatile products is urea, most of which is derived from the ammonia of the amino-acids absorbed in excess of the amount required for repair. There are a number of others in small quantity, some nitrogenous, others not, which, although not really of a toxic nature, are of no value. These are all non-colloidal and therefore pass freely through the wall of the blood-vessels. The colloidal constituents of the blood, mainly proteins, and the blood corpuscles do not normally pass through, except in a few places, such as the liver, where the membrane is incomplete. Owing to the pressure produced by the heart, there is a tendency to a continuous filtration through the walls of the blood-vessels of a solution containing all the diffusible constituents of the blood. But the proteins of the blood do not diffuse and, since they are such as to have an osmotic pressure of about 30 to 40 mm. of mercury, they may be regarded as attracting water with a force of this magnitude. Unless the blood pressure exceeds this value, therefore, no filtration occurs, and where it is below, reabsorption takes place. The pressure in the arterioles and beginning of the capillaries exceeds the osmotic pressure of the colloids, whereas it is lower than this in the rest of the circulation. In the greater part of the body, the filtered fluid escaping reabsorption is known as lymph. In the kidneys, the glomeruli are arranged so as to filter a large amount of fluid, which is the first stage of the production of urine. This process as described would suffice to remove all the waste products. But if the whole filtrate were allowed to escape from the kidney, not only would a large quantity of water be lost, but with it such valuable substances as salts and food materials, sugar and amino-acids. What we actually find is that the filtrate is caused to pass along a system of tubules, in the course of which a large part of the water, together with useful solutes, is reabsorbed, while the useless waste products are left in more concentrated solution. It has been shown by Cushny that if it be supposed that the fluid absorbed has invariably the normal composition and concentration of the blood plasma as regards diffusible substances, but without the waste products, all the phenomena of renal function can readily be explained.

It would appear that the chief function of the plasma proteins is to confer a colloidal osmotic pressure, so that excessive filtration is avoided. In the absence of such an osmotic pressure, not only would a large amount of liquid be exuded into the tissues, but there would be no force available for its reabsorption and dropsical state would result. In fact, this is what happens when a simple salt solution is introduced into the circulation (*see* SHOCK).

On the basis of the theory given above, it will be noted that the energy for the actual production of the glomerular filtrate is provided by the blood pressure, that is, by the contraction of the heart. On the other hand, the cells lining the tubules have to do work against osmotic forces, since they remove a dilute solution from a more concentrated one. This work increases as the fluid passing along the tubules becomes more concentrated. It must be provided by some cellular mechanism analogous to a pump, requiring the provision of energy to actuate it. The investigations of Tamura indicate that this consumption of energy per unit time is unchanged, whatever may be the amount of urine produced by the kidney. Hence, the more concentrated the glomerular filtrate, the less fluid is reabsorbed from it.

**Stimulation and Environment.**—The capacity of an organism to respond in an appropriate manner to changes in its environment clearly depends on its power of properly appreciating such changes. Hence, the more richly endowed is an organism with means by which it is enabled to be affected by the various forms of energy impinging upon it, the better it is fitted to profit, both materially and intellectually, by knowledge of the outer world.

In order to understand the essential character of a receptor or sense-organ, as we call the structures by which such information is obtained, one or two fundamental facts brought out more clearly by investigations in recent years have to be considered.

Receptor organs are connected to the brain each by its own set of nerve fibres. These fibres proceed to special regions in the brain, and it appears that whatever the manner in which impulses are set in motion along the fibres, the process in them is the same. So that the fact that the sensations aroused are in one case light, in another taste, and so on, depends on the terminus in the brain. And from

whatever source this terminal "centre" is aroused to action, the effect in consciousness is the same. If, for example, the trunk of a nerve of taste is stimulated, either electrically, mechanically, or chemically, a sensation of taste is evoked. A further fact that has been made clear by Adrian's experiments is that the nerve-impulse itself cannot be made other than of a definite magnitude by varying the strength of the stimulus. In any particular state of the nerve, if it is excited at all, the maximum response possible is obtained. In the case of the heart muscle, this fact has long been known and was given the name of the "law of all-or-nothing" by its discoverer, Bowditch. This law has now been shown to hold for voluntary muscle and for nerve. It is true that the work of Adrian was done on motor nerves, but no difference between these and sensory fibres in other respects has been shown to exist, and there is some direct evidence that the law holds in the case of the optic nerve. It appears then that the impulses travelling along nerves are the same in all cases and that their various results are due merely to the structures in which the fibres end. The statement applies also to efferent nerves, in that there is no difference in nature between nerves which have excitatory and those which have inhibitory action on the structures in which they end. The difference, as Langley pointed out, is in the manner in which their final connexion is made. The question is indeed an aspect of Müller's law of specific sense-energies. The name is not very explicit, but the law states that the excitation, however produced, of each nerve of special sense gives rise to its own peculiar sensation.

We see then that what is required in a receptor organ is that some process shall be set going in at the incidence of a particular form of external energy, and that this process shall be such as to stimulate the nerve fibres arising from the organ. It is clear that receptors of a different kind are necessary in the cases of light, sound, heat, touch and so on. While the nerve fibre itself can be stimulated by pressure or by heat of sufficient intensity, it is insensitive to light or sound waves, and even in the former case its sensibility to direct action is far too small for the appreciation of the fine degrees of touch, temperature, etc., which is required. The state of affairs is well shown by the properties of the heat and cold spots on the skin. There are distinct receptors for temperatures above that of the skin and below it. The former give a sensation of heat, the latter of cold, and a temperature that feels warm to a heat spot has no effect on a cold spot and *vice versa*. Thus each is especially sensitive to its own appropriate stimulus. If an electrical stimulus or a temperature high enough to affect the nerve fibres directly is used, the sensation from a heat spot is one of warmth, the opposite from a cold spot. But the intensity of stimulus necessary is much greater than that required in the stimulus for which the particular organ is adjusted. The paradoxical fact that a temperature of 45°C. feels hot to a heat spot and cold to a cold spot is readily explained on the basis of stimulation of the nerves of the organ and the operation of the law of specific sensation. Although it is not easy to prove the fact directly, there is every reason to believe that, at all events in the higher senses, each separate nerve fibre has its own special connexion in the brain and its own individual sensation.

It was remarked above that, so far as evidence goes, all nerve impulses are alike. There is, however, a possibility, pointed out by Keith Lucas, that these impulses may, within the limits imposed by the refractory period, follow one another at different intervals of time. Then, if a particular nerve fibre is connected with two or more neurones in the centre, and if the properties of transmission or refractory periods of these "synapses" differ, it may happen that a rapid series of impulses may be able to pass one and not the others. In this way, a single nerve fibre may serve more than one purpose.

For further details the following books may be consulted: Starling, *Principles of Human Physiology* (3rd ed., London, 1920); Bayliss, *Introduction to General Physiology* (London, 1919); Bayliss, *Principles of General Physiology* (3rd ed., London, 1920). In the latter, references will be found in the "bibliography" to special monographs and original papers. (W. M. B.)

**PICKERING, EDWARD CHARLES** (1846-1919), American physicist and astronomer (*see* 21.582), died in Cambridge, Mass., Feb. 3 1919.

**PINERO, SIR ARTHUR WING** (1855- ), English dramatist (*see* 21.625). Amongst his later plays are *The Mind the Paint Girl* (1912); *The Big Drum* (1915); *Mr. Livermore's Dream* (1917); *The Freaks* (1918); and a wordless play, *Monica's Blue Boy* with accompanying music by Frederic Cowen.

**PIRRIE, WILLIAM JAMES, 1ST VISCOUNT** (1847- ), British shipbuilder and engineer, was born at Quebec May 31 1847, and educated at the Belfast Royal Academic Institution. In 1862 he entered the shipbuilding firm of Messrs. Harland & Wolff of Belfast, and by his industry and talent he rose to be its head, becoming partner in 1874 and later chairman. His success was particularly associated with the building by his firm of the White Star Line steamships, the first of the line, the "Oceanic," being launched in 1870. From 1896 to 1897 he was

Lord Mayor of Belfast, and in 1898 the freedom of the city was conferred upon him. In 1906 he was raised to the peerage as Baron Pirrie, and was for a time comptroller of the household of the Lord Lieutenant of Ireland, and pro-chancellor of Queen's University, Belfast. Towards the close of the World War, in 1918, he was made controller-general of merchant shipping. In 1921, on the King's visit to Belfast to inaugurate the new Parliament of Northern Ireland, he was created a viscount.

**PISSARRO, LUCIEN** (1863— ), Anglo-French painter and engraver, was born in Paris on Feb. 20 1863, the son of the painter Camille Pissarro (see 21.652). He studied art under his father, and at the suggestion of Auguste Lepere took up wood engraving. In 1891 he came to England, and there began his studies in typography. In 1894 he started the Eragny Press and published a series of books, using until 1903 the Vale type designed by Charles Ricketts and afterwards the Brook type designed by himself. The initial letters, borders and illustrations engraved on wood were throughout mainly from his own designs, and sometimes show very skilful and refined use of colour and gold. Among the most notable productions of his press are *L'Histoire de Soliman Ben-Daoud* (1907); *Le Livre de Jade* (1911) and *La Charrue d'Érable* (1912), with illustrations engraved in colour from drawings by Camille Pissarro, one of his son's few essays in reproductive engraving. He also produced a considerable number of isolated woodcuts. As a painter, he uses the "spectral palette" of the impressionists, and works in a high key. He early devoted himself to the study of subtle gradations and variations in colour, and adopted a pointillist technique, afterwards modified into a broader method of handling, with more emphasis on design. His work is almost entirely English landscape, notable recent examples being "Coldharbour, Teatime" and "Crockhurst Lane, Coldharbour." He became a member of the New English Art Club, was a member of the Camden Town Group, and was the principal founder of the Monarto Group. He became a naturalized British subject in 1916. He is represented in the Tate Gallery, and in the art galleries of Leeds and Manchester.

**PISTOL** (see 21.654).—During recent years the automatic pistol has been gradually perfected and adapted to replace the revolver as a military side arm, despite the fact that there are many who maintain that the revolver is the more dependable weapon. The automatic pistol, like all complicated mechanisms, occasionally malfunctions, usually due to a defective magazine or cartridge. This disadvantage is, however, offset by the fact that from the pistol about three times the number of shots per minute may be fired as from a revolver; its magazines are changed instantly, thus giving sustained fire while loaded magazines are at hand. This gives a great advantage to the user of a properly working pistol, as a revolver is often useless at close quarters, such as obtained in trench raids, after its six shots have been fired. In such positions the volume of fire from a group of pistols is much greater than that from an equal number of revolvers even if a pistol is occasionally disabled by a jam.

Owing to its simpler mechanism, the revolver is more reliable for civilian self-defence where more than two or three shots are seldom required; the weapon then being unused and often neglected for long periods. The revolver is also considered superior to the automatic pistol in safety. In the latter, the loaded cartridge automatically inserted in the chamber after each shot is liable to be forgotten and left there when the magazine is taken out. To prevent accidental discharge from this source, some of the newer models have a "magazine safety," which prevents the pistol from being fired when the magazine is out. In addition, a "grip safety," which prevents discharge unless the rear part of the grip is pressed in at the same time the trigger is pulled; and a safety catch, which locks the slide and hammer, are often used. Recent models of revolvers show no improvements of note, and it is probable that with the attention now being given to the design of the automatic pistol, that weapon will eventually be made as reliable, safe, and quick to get into action as a good revolver.

In European armies previous to the World War, the pistol was used almost exclusively as an officer's side arm. Their weapons were of small calibre, ranging from 7.63 mm. to 9 mm., and lacked stopping power. During the war the use of the pistol and revolver was extended to include many branches of the service not armed with rifles, particularly by the United States, British and German armies. The large calibre weapons of the former armies gave them a great advantage in pistol fighting, and their use confirmed previous opinions that a large calibre heavy bullet of short range and low velocity is more effective in a pistol than a high velocity, small calibre bullet.

Automatic pistols have now been adopted by the armies of the United States, Belgium, Spain, Italy, Denmark, Portugal, Switzerland, Germany and Austria. The British navy has adopted the Webley automatic pistol. In the table on page 107, details are given.

**Colt Automatic Pistol.**—The Colt automatic pistol, calibre .45 (fig. 1), was adopted by the U. S. army in 1911. This pistol differs radically from older Colt models in that it has a sloping handle, grip safety (1), spiral mainspring (2), an improved method of locking the barrel and breech, also an improved slide action and magazine catch (3). The magazine (4) has a capacity of seven cartridges. The ammunition for this pistol has a muzzle velocity of 800 f.s., with a 230-grain bullet. The striking energy is 329 ft. lb., which gives a penetration of 6 in. of white pine at 25 yards. The pistol is capable of great rapidity of fire, 21 shots having been fired in 12 seconds beginning with the pistol empty.

The action of the .45-calibre pistol, assuming that it is cocked and ready to fire, is as follows: When the trigger (5) is pulled, the sear (6) is released, and the hammer (7), actuated by the mainspring (2), goes forward and strikes the firing-pin (8), which transmits the blow to the primer of the cartridge. The pressure of the gases generated in the barrel (9) by the explosion of the powder in the cartridge, is exerted in a forward direction against the bullet, and in a rearward direction through the cartridge case against the face of the slide (10), driving the slide and the barrel to the rear together. The link (11), one end of which is fixed to the frame and the other to the barrel, causes a downward pull on the barrel when it recoils, which disengages the barrel lugs (12) from the slide, and the barrel is then stopped in its lowest position. The slide continues to move to the rear, opening the breech, and cocks the hammer (7) which moves the hammer strut (13) downward, compressing the mainspring (2). The sear (6) actuated by the sear spring (14) engages in the notch on the hammer (7). Extracting and ejecting of the empty shell are accomplished and the recoil spring (15) compressed until the slide reaches its rearmost position, when another cartridge is raised into loading position. The cartridge is forced into the chamber of the barrel by the return movement of the slide under pressure of the recoil spring. The slide during its forward motion encounters the rear extension of the barrel and forces the barrel forward; the rear end of the barrel swings upward on the link (11) to the normal firing position. When the slide and barrel reach their forward position they are positively locked together by the locking lugs on the barrel and their joint forward movement is arrested by the barrel lug encountering the pin on the slide stop (16). The pistol is again ready for firing.

The inertia of the slide augmented by that of the barrel is so much greater than the inertia of the bullet that the latter has been driven from the muzzle of the barrel with its maximum velocity before the slide and the barrel have recoiled to the point where the barrel commences its unlocking movement. This construction delays the opening of the breech of the barrel until after the bullet has left the muzzle and therefore practically prevents the escape of any of the powder gases to the rear after the breech has been opened.

This factor of safety is further increased by the tension of the recoil spring and mainspring, both of which oppose the rearward movement of the slide.

The U.S. army uses the pistol as the standard side arm. All officers and enlisted men in the cavalry, field artillery, tank corps, signal corps and machine-gun companies, and most of the officers and non-commissioned officers in other branches are armed with it.

In the shortage of pistols incident to the World War, Colt and Smith & Wesson revolvers of the same calibre, chambered for the same rimless cartridges, were used. The use of the rimless cartridge in the revolver was accomplished by providing semicircular loading clips which hold three cartridges by lugs which fit in the cannellure of the cartridge. The ejection is accomplished by this means. The clips make the loading much faster.

The Colt automatic pistol is also made in .22-in., .25-in., .32-in., .380-in., and .38-in. calibre military models.

*BROWNING AUTOMATIC PISTOL.*  
FIG. 2.

**Browning Automatic Pistol.**—The new model Browning automatic pistol (fig. 2) made by the Fabrique Nationale, Belgium, is representative of modern automatic pistols of pocket size. This pistol is made in 7.65-mm. (.32) and 9-mm. (.380) calibres. A military model of 9-mm. calibre is also made which is used by the Belgian army. The pistol shown is of the "blow back" type, the barrel (17) being locked to the frame (18), the slide (19) being free to recoil. On pulling the trigger (20) and pressing in the grip safety (21), the sear (22) revolves on its axis and releases the firing-pin (23), which actuated by the coiled firing-pin spring (24), moves forward and fires the cartridge. The inertia of the slide assisted by the recoil spring (25) delays the rearward motion of the slide until the bullet passes through the barrel. The slide then recoils, compresses the recoil spring and the firing-pin spring and ejects the empty cartridge case. When the notch in the under side of the firing-pin passes over the sear nose, the latter actuated by the sear spring (26) rises and holds the firing-pin in a cocked position. When the effect of the recoil is overcome, the slide moves forward in the usual manner feeding a loaded cartridge in the chamber. The magazine (27) is released by the catch (28), and when the magazine is taken out the magazine safety (29) locks the sear and prevents discharge.

**Webley Automatic Pistol.**—The Webley, the only automatic pistol manufactured in Great Britain, is made in .25, .32, .380, .38 and .455 calibres (fig. 3). The latter size, which fires a 220-grain bullet, has been adopted by the British navy.

The action is unique in that a flat recoil spring (30), situated in a recess in the right grip and compressed by the recoil lever (31), absorbs the recoil and returns the slide (32) to firing position. In the larger calibres, the barrel (33) is locked to the slide at the moment of firing and these parts recoil together a short distance; the barrel then rises upon diagonal cam-shaped lugs which unlock the slide and permit it to travel back alone. During this rearward movement, the empty case is ejected and the hammer (34) cocked. The forward motion of the slide then feeds a cartridge from the magazine in the chamber in the usual manner. The trigger (35) is connected with the sear (not shown) by means of a trigger auxiliary lever (36) and sear tail (37). The magazine is situated in the handle and holds eight cartridges.

The .32 calibre Webley pistol is used by the London metropolitan police. A .25 calibre hammerless model has recently been brought out which has a spiral recoil spring parallel to the barrel in a recess in the slide.

*WEBLEY AUTOMATIC PISTOL.*  
FIG. 3.

**Savage Automatic Pistol.**—This pistol (fig. 4), which is extensively used in the United States, and has been adopted by the army and navy of Portugal, is made in .32 and .380 calibres. The magazine for the former holds ten cartridges; that for the latter, nine. The 1917 model differs from the previous one in that an outside cocking lever is added, and the shape of the grip changed to facilitate aiming. There is no grip safety or magazine safety on this pistol, the cocking lever indicating whether it is in firing position. The barrel and breech are locked at the moment of firing by means of a locking lug on top of the barrel which engages with an angular locking slot in the bolt and makes it necessary for the barrel to rotate about one-eighth of a turn to the right to unlock. The resistance of the bullet to rotation in the rifling tends to twist the barrel to the left and prevents the bolt from turning it to the right until the bullet leaves the barrel. The momentum of the recoil then forces the bolt back, the angular slot rotates the barrel and the rest of the cycle of operations is performed much as in the pistols already explained.

*REMINGTON AUTOMATIC PISTOL.*  
FIG. 3.

**Remington Automatic Pistol.**—The newest (1920) model automatic pistol to be placed on the market is the Remington .380 calibre automatic (fig. 5). In general this weapon follows the usual lines of automatic pistols. The breech closure is of the positively locked recoil-operated type. The recoil spring is held in a sleeve concentric with the barrel, and the magazine, which holds seven cartridges, is in the stock. The weapon has three safety devices: a grip safety, a side safety catch which also indicates whether the weapon is cocked or not, and a magazine safety which prevents the pistol from being fired when the magazine is withdrawn. The recoil when a shot is fired forces a movable breech block in the slide backward for about  $\frac{1}{8}$  in., and into contact with recesses in the frame, this movement accomplishes primary extraction and transmits an initial thrust to the slide which is free to move backward against the recoil spring. This movement of the slide through a camming action lifts the breech block out of engagement with the frame and carries the breech back, cocking an internal hammer and ejecting the empty case. The chamber is reloaded in the usual manner on the return stroke. There are no screws in this pistol and it may be disassembled without tools other than the firing-pin.

**European Pistols.**—The German Parabellum (Luger) and Mauser pistols have been little changed from those described in previous editions of the E.B. The Parabellum 9-mm. calibre is the standard German military arm, but during the shortage, incident to the World War, they used a great variety of weapons, the principal ones being the Mauser, Bayard, Browning, Borchardt, Bergman, Pieper, Sauer and Dreyse. There were reported to be 28 different models of pistols and revolvers in use in the German army. The Parabellum is also used by the Swiss and Bulgarian armies.

A drum or "snail" magazine (fig. 6) holding 32 cartridges was applied to the Luger pistol during the war. This magazine consists of a straight section similar to the ordinary pistol magazine with a round enclosed drum at the bottom. There are two springs, one functioning as an ordinary magazine spring, and a flat drum spring resembling a clock spring which with its casing fills the drum except for space for a single row of cartridges around the edge. There is a lever and catch on the outside for winding this spring and a rotating feeding lever inside which fits in the cartridge space between the inner casing and drum. The magazine spring is compressed between the last cartridge and this lever, which being revolved by the drum spring pushes the magazine spring and cartridges around the drum as the pistol is fired. When the drum is empty the magazine spring functions in the usual manner. This style of magazine was also applied

to the Bergman pistol gun and the Mondragon semi-automatic rifle. It destroys the balance of an arm and is of doubtful value.

The Bayard automatic pistol 9-mm. calibre is used in the Danish army. The commercial pistols of this make in .32 and .380 calibres

LUGER AUTOMATIC PISTOL  
WITH SNAIL MAGAZINE  
FIG 6

are the smallest automatics of these calibres on the market. The Victoria is the smallest .25 calibre. The Mannlicher is used by the Austrian army.

The Campo-Giro automatic pistol 9-mm. calibre was adopted by Spain in 1914. The principal merit claimed for it is that a special recoil check lessens the shock and permits more accurate firing.

#### AUTOMATIC PISTOLS AND THEIR CARTRIDGES

Cartridge	Barrel Length, Inches	Weight of Bullet, Grains	Muzzle Velocity, Ft. Seconds	Energy of Bullet, Ft. Lb.
.22 Long rifle rim fire	6 1/2	40	765	51.8

(H. O. L.)

**PITTSBURGH** (see 21.678) had, according to the U.S. census of 1920, a pop. of 588,193. The increase over 1910 was 54,288 or 10.2%. After the 1920 census was taken the township of Chartiers, with a pop. of 5,000, was annexed, petitions were filed for the annexation of the borough of Homestead with a pop. of 20,452, and a movement was on foot for the merger of the boroughs of Wilkensburg (24,403), Ingram (4,000), Grafton (5,934) and others. Within the metropolitan district of a 10-m. radius, but outside the city limits proper, there was a further population equal in number to that within the municipality itself. In Allegheny county, of which Pittsburgh is the county seat and business centre, there were in 1920 1,184,832 persons, 13.6% of the total pop. of Pennsylvania.

The sesqui-centennial of Pittsburgh, elaborately observed in 1908, marked the beginning of a new period of corporate, educational, social and material development. By legislative enactment (1911) the former Common and Select Councils gave way to a small council of nine members, elected by general vote of

the entire city. The mayor continued to appoint the heads of departments (safety, works, health, charities, supplies, property, water, treasury). The comptroller also was elected as formerly by popular vote. The expanding of public business in the city and county, exceeding the capacity of the city hall and the court-house, led to the erection by joint action of a new City-County Building, a fine structure of nine stories. The county in 1920 was completing a twin tunnel under Mount Washington to connect the southern hill district with the city by a high level bridge over the Monongahela river, which will bring that district within 15 minutes' transit of the centre of the city. In 1919 the taxable valuation of Pittsburgh was \$1,113,667,425, and the tax rate in 1921 was, for the city, 20 mills on land, 14 mills on buildings and 8.50 mills for school purposes. In 1919 a bond issue of \$22,500,000 was voted by the people for subway, boulevards, playgrounds, bridges, parks, etc.

The value of Pittsburgh's products in 1919 was \$602,582,300, compared to \$246,694,000 in 1914. In 1920 it held sixth place in bank clearings (\$8,982,887,399) and first place in *per capita* deposits (total \$817,013,249) and in the manufactured products—iron, steel, glass, electrical machinery, steel cars, tin-plate, air brakes, fire-brick, white lead, pickles and preserves, corks and aluminium. The production of pig iron in the city in 1919 was 31,015,364 tons and in the surrounding district 7,440,746 more, a total of 38,456,110 tons. Metal and metal products were valued at \$324,261,900; chemical products \$2,045,800; clay, glass and stone products \$4,345,500; clothing manufacture \$7,122,800; slaughtering and meat-packing \$21,134,700; confectionery \$6,490,500; leather and rubber products \$5,589,700; cork-cutting \$4,016,500; oil-well supplies \$3,678,100. The production of radium in 1920 (18 gr.) probably exceeded that of the rest of the world. The sum of \$970,072,700 was invested in 2,580 industrial plants, mills, foundries and furnaces, in which were employed 221,621 men, with a daily pay-roll (1920) exceeding \$2,500,000. The annual tonnage of Pittsburgh is 2 1/2 times the combined tonnage of New York, London and Hamburg. As a port of

entry the value of imports in 1918 was \$6,391,960. The city's contribution to the Liberty and Victory loans was \$625,429,600, to the Red Cross \$10,104,765, and to the seven relief agencies \$13,909,000, making a total of \$649,533,365.

In 1911 the Legislature adopted a new school code for the entire commonwealth, coming into operation Nov. 11 1911. Under this code a Board of Education, consisting of 15 members appointed by the Common Pleas judges, took control. Separate school districts were abolished; a new city superintendent, with associate superintendents, was appointed; the scattered and unrelated school agencies were consolidated; new high schools and junior high schools established and buildings erected, such as the Schenley high school, built in 1916 at a cost of \$1,500,000 and accommodating 2,000 students. New ward schools of modern construction were established. The teachers numbered in 1920 2,015 in 133 grade schools and 494 in 11 high schools, and the enrolment of pupils in grades was 74,654 and in high schools 12,169. There were in evening grades 198 teachers and 6,245 pupils, and in evening high schools 148 teachers and 5,090 pupils. The public-school system was supplemented by parochial schools which had in 1920 650 teachers and 33,000 pupils. In addition to the high schools there were a number of academies and other schools, 77 in all, on private foundations. The development of higher education during the decade was notable. The Holy Ghost College

became Duquesne University, and in 1920 had 2,129 students, including department of law, 86 students, and evening school of accounts and finance, 1,120 students. The Carnegie Institute in the decade increased the extent of its service to the community; its central library, with 464,313 volumes, had 8 branches, 16 stations, 128 school stations, 10 club stations and 8 playground stations, with a circulation of 1,363,365 books; both the scientific museum and the art department added greatly to their collections; in the school of technology the enrolment grew from 2,102 students in 1909 to 4,982 students in 1920, including those in the departments of science and engineering, arts, industries and the Margaret Morrison school for women. The university of Pittsburgh, established in 1908 by assembling the scattered departments of what was the Western University of Pennsylvania, and taking over 43 ac. near the Carnegie Institute for a campus, grew rapidly in its new location, and in 1920 numbered 4,979 students. In the same year there were in the city 227 social, health, religious and welfare agencies.

After careful study of playground systems a bond issue of \$800,000 was voted (1919) to initiate a constructive development of parks and playgrounds at public expense. Another civic improvement was the plan that a permanent committee of citizens should be engaged in the solving of the housing problem, and that the chamber of commerce, co-operating with the state, should employ a director in charge of the Americanization programme in which the public schools and corporations coöperate. The Society for the Improvement of the Poor, constructed and opened (1921) the Wayfaring hotel to accommodate 500 men. The 20 hospitals, modern in construction and equipment, with 4,500 beds, included special hospitals for children, eye and ear, maternity, tuberculosis, and contagious diseases. The Magee hospital, established by legacy of \$3,500,000 under will of the late C. L. Magee, by agreement the maternity hospital of the university of Pittsburgh, is perhaps the most modern and complete maternity hospital in America. (S. B. Mc.)

**PIUS X.** [**GIUSEPPE SARTO**] (1835–1914), Pope (see 21.690), died Aug. 20 1914. Although the pontificate of Pius X. lasted only 11 years (Aug. 4 1903–Aug. 20 1914), it has been said that his work for the Church, reconstructive and reformatory, surpassed that of any of his predecessors since the days of Sixtus V., who died in 1590. In the defence of the Faith, his condemnation of the 65 propositions of Modernism in 1907 will rank in Catholic theology as a parallel to the condemnation of the 68 propositions of Molinism by Innocent XI. in 1637 or the 101 propositions of Jansenism condemned by Clement XI. in 1713. The activity of the pontificate may be judged by the fact that its output of papal Bulls and greater official papal documents (counting only those published) exceeded 3,322. These bear upon undertakings and reforms of the first importance—the codification of canon law; the protection of the liberty of the Conclave by the abolition of the Exclusiva; the simplification and security of the conditions of marriage by the *Ne Temere* legislation; the restoration of the Rota as the supreme Court of Appeal; the regulation of the triennial or quinquennial visits of bishops to Rome; the legislation as to Church music; and the decree as to First Communion, and the encouragement of international eucharistic congresses; the reform of the Roman breviary; the founding of the biblical institute for the work of Scriptural research; the regulation of studies in the seminaries; the creation of the commission for the great work of editing the true text of the Vulgate; the reconstruction of the official machinery of the Roman Curia; the transfer of the English-speaking countries from the propaganda or missionary régime to the normal government of the Church. To these may be added in the domain of discipline the unflinching vindication by Pius X. of the Church's right to depose delinquent bishops, carried out even at the cost of rupture of diplomatic relations with France; an apostolic visitation rigorously carried out through the dioceses of Italy, resulting in four bishops being caused to resign on account of neglect or inefficiency; a further regulation by which no one can be proposed for a bishopric unless his promotion receives the visa of the Holy Office, which means that his past life has been free from ecclesiastical censure or reproach.

The well-known personal characteristics of Pius X. were his piety, charity, deep humility, simplicity, pastoral zeal, combined with great charm of manner to all who approached him. For war he had nothing but horror and it was the shock of the outbreak of the World War that hastened his death. It is said that one of his last acts was to refuse the request of the Austrian Emperor to bless his soldiers, saying, "I do not bless war: I bless peace." (J. Mo.)

**PIUS XI.** [**ACHILLE RATTI**], elected Pope on Feb. 6 1922 at the Conclave following the death of Benedict XV., was born May 30 1857, at Desio, near Milan. He came of a middle-class Italian family, his father, Francesco Ratti, being manager of a textile factory. Achille was the third of six children, and was educated for the priesthood at the seminary of Milan and the Lombard College in Rome, becoming deacon in 1877 and priest in 1879. Devoting himself to study, he took doctorates in philosophy, theology and canon law in Rome, and in 1882 became a teacher in the major seminary at Milan. In 1888 he was chosen one of the college of doctors of the Ambrosiana Library in Milan, where he worked assiduously, becoming librarian in 1907, and attaining so high a reputation as a scholar that in 1910 he was also appointed by Pius X. vice-prefect of the Vatican Library. He was prefect of the Vatican Library from 1913 to 1918, and in this capacity was made a Monsignor. During the war years his exceptional gifts as a diplomatist impressed themselves on Benedict XV., who, in the spring of 1918, sent him as Papal Nuncio to Poland, where his success led to still further distinctions. In June 1919 he was created Archbishop of Lepanto, in April 1921 Archbishop of Milan, and in June 1921 cardinal.

**PLENER, ERNST, FREIHERR VON** (1841– ), Austrian statesman, was born on Oct. 18 1841 at Eger in Bohemia, the son of the excellent Austrian statesman Ignaz von Plener (1810–1908). He began his diplomatic career in 1865, and served in the Paris and London embassies until 1873. In the latter year he was elected by the Chamber of Commerce of his native place to the Chamber of Deputies of the Reichsrat, where he was soon reckoned among the most conspicuous members of the Constitutional party. In the Taaffe period (1879–93) he was one of the leaders, and from 1888 the acknowledged head of the German-Liberals in their struggles against the Slav-Conservative majority in the Chamber. Consequently he represented Germanism on the nationalities question, but was not averse to concessions compatible with the maintenance throughout the whole monarchy of the position due to the German Austrians. He sought to compromise the quarrel between Germans and Czechs, and the so-called "points" of 1890, a summary of the bases for a German-Czech understanding, were essentially his work. In the Windschütz Coalition Ministry (1893–95), Plener took over the portfolio of Finance. Soon after his retirement from the Finance Ministry, Plener was appointed president of the Supreme Audit Department (*Oberste Rechnungshof*). He became a member of the Upper House in 1900.

Plener wrote a series of economic and political works, among others *Die Englische Fabrikgesetzgebung* (1871); *Englische Baugenossenschaften* (1873). His speeches were published by his friends in 1911. He himself published *Erinnerungen* (3 vols., 1911–21). (A. F. Fr.)

**PLUMER, HERBERT CHARLES ONSLOW PLUMER, 1ST BARON** (1857– ), British field marshal, was born March 18 1857, and entered the army in 1876. He served on the Red Sea Littoral in 1884, and in 1896 commanded a mounted regiment in the Matabele Campaign, for which he was promoted brevet lieutenant-colonel. Before the outbreak of the South African War in 1899 he was sent out to the Cape on special service, and he raised the Rhodesian field force, which he commanded during the early months of the contest. He assisted in the relief of Mafeking, and was promoted colonel, appointed A.D.C. to the Queen, and given the C.B. In the later stages he was constantly in command of a column or a group of columns, and he was promoted major-general on the conclusion of hostilities. He commanded a brigade at home from 1902–4 and was then appointed quartermaster-general at headquarters, a position which he vacated at the end of 1905; shortly afterwards he was appointed commander of the 5th Division. He was promoted lieutenant-general in 1908 and in 1911 was placed in charge of the Northern Command.

In May 1915 Sir Herbert Plumer was selected to lead the II. Army on the western front, and shortly afterwards he was promoted general. His army was not very actively engaged during the remainder of 1915, nor yet in 1916, in which year he was given the G.C.M.G. for his services. But on June 7 1917

Plumer gained a signal victory at Messines on the opening of the Flanders offensive, for which he was given the G.C.B. Three months later he assumed charge of the operations east of Ypres, which had been making slow progress, and his dispositions were for a time highly successful; but the recovery of the whole of the high ground could not be accomplished owing to the lateness of the season. Then, just as the Flanders offensive concluded, he was in Nov. selected to take charge of the British troops that were being sent to the basin of the Po after the Italian defeat at Caporetto. He commanded them until March but he was then summoned back to Flanders to resume leadership of the II. Army just before the great German offensive started. During the later stages of the hostile effort his troops were forced back some miles, but they succeeded in checking the enemy. Then, when the general advance of the Allies began in Aug., his army took a very prominent part in the operations by which Belgian Flanders was recovered from the invaders. For his services in the war he was raised to the peerage as Baron Plumer of Messines and of Bilton, was promoted field marshal, and received a grant of £30,000. He subsequently commanded the British forces on the Rhine for a short time, and in June 1919 went out to Malta as governor and commander-in-chief.

**PLUNKETT, SIR HORACE CURZON** (1854— ), Irish politician (see 21.857), after his retirement in 1907 from the vice-presidency of the Irish Agricultural Department, took no prominent part in politics till the crucial year 1914. In Feb. of that year, when suggestions for an agreed settlement of the Irish difficulty were pouring in from all sides, he came out, in a long letter to *The Times*, with a scheme of his own, under which Ulster should accept the Home Rule bill, but should have a right to secede after a term of years, while the Ulster Volunteers should become a Territorial Force, partly as an ultimate safeguard of the Ulster Unionists. Hitherto he had been regarded as a moderate Unionist, but this suggestion rendered him suspect in Ulster eyes, and the suspicion was confirmed when he published in the third week of July a pamphlet entitled *The Better Way: an Appeal to Ulster not to Desert Ireland*, in which he announced his conversion to Home Rule and appealed to Ulster to give Home Rule a chance, re-stating the arguments of his previous letter, and suggesting a conference of Irishmen on the bill. This was his attempt to avert civil war; but the situation was revolutionized by the outbreak of the World War. Once again, in 1917, a year after the Dublin rebellion, he took the lead in an honest attempt to solve the Irish question. When Mr. Lloyd George set up a comprehensive convention of Irishmen to consider the matter, and report their conclusions, there was great difficulty in finding a suitable chairman; but the first meeting unanimously chose Sir Horace for the post. He was himself sanguine, and worked at his task with singular devotion; but the absence of Sinn Féin from the gathering, the impossibility of reconciling the views of the Ulstermen and the southern Unionists, and the occurrence of a number of tragic events in Ireland, prevented the adoption of any report with colourable unanimity. In 1920-1 he was a prominent advocate of "Dominion Home Rule" (see IRELAND: History).

**PODMORE, FRANK** (1856-1910), English psychologist, was born at Elstree, Herts, Feb. 5 1856. Educated at Haileybury and Pembroke College, Oxford, he became interested in psychical research, and was closely associated with Edmund Gurney and F. W. H. Myers in the telepathic and psychical investigations described in their joint publication *Phantasms of the Living* (1886). He also published *Apparitions and Thought Transference* (1894); *Studies in Psychical Research* (1897); *Modern Spiritualism* (1902) and other works on the subject. He was found drowned near Malvern Aug. 15 1910.

**POINCARÉ, JULES HENRI** (1854-1912), French physicist (see 21.892), was born at Nancy April 29 1854, and educated at the *lycée* in that town. As a boy he served in an ambulance corps during the Franco-Prussian War of 1870, and later passed with distinction through the *École Polytechnique* in mining, becoming a mining engineer, but soon abandoning practical work for teaching, first at Caen and later in the university of Paris. He

won the King of Sweden's open prize for a mathematical treatise in 1889; and in 1908 was elected to the Académie Française. He was a voluminous writer on his own special subjects. Some details of his contributions to science are given in 19.859, 25.786 and 26.047. He died in Paris July 17 1912.

**POINCARÉ, LUCIEN** (1862-1920), French physicist (see 21.892), was born at Bar-le-Duc July 22 1862. After a distinguished academic career he became in succession inspector-general of physical science in 1902, director of secondary education at the Ministry of Public Instruction in 1910, director of higher education in 1914 and rector of the Académie de Paris in 1917. In that capacity he received President Wilson at the Sorbonne on the occasion of his visit to Paris for the Peace Conference. He died in Paris March 9 1920.

**POINCARÉ, RAYMOND** (1860— ), French statesman and writer (see 21.892). After the fall of the Sarrien Ministry in 1906 M. Poincaré ceased for some years to take an active part in politics. On Dec. 9 1909 he was made a member of the French Academy. In 1911 he was invited to join the Monis Ministry, but refused. His opportunity came at the beginning of 1912, and on Jan. 13 he became head of what was popularly known as the "great" or "national" Ministry, in which he also held the portfolio of Foreign Affairs. As Prime Minister Poincaré aimed at safeguarding the interests of France abroad, especially against the menace of the Triple Alliance, and at strengthening her at home by firm government and the restoration of social discipline. In this he was helped by the revival of a strong national feeling in France, provoked by the international crisis of 1911. The fact that he was a Lorrainer prejudiced public opinion in his favour, and his popularity was increased by his foreign policy—especially the successful establishment of the French protectorate over Morocco and the conclusion of the naval agreement with Russia. In Aug. 1912 Poincaré went to St. Petersburg to confer with the Tsar and his ministers about the Franco-Russian Alliance and the new developments of the Eastern question, a visit which countered the somewhat depressing effect in France of the meeting of the German and Russian Emperors at Baltic Port on July 4. The Balkan Wars, and Poincaré's attitude towards the problem raised by them, greatly increased his prestige; he declared on Dec. 4 to the Foreign Affairs Committee of the Chamber that he was determined to secure respect for the economic and political interests of France, not only in the Balkan Peninsula, but in the Ottoman Empire generally, and especially in Syria.

At the beginning of 1913 he became a candidate for the presidency. This action excited strong personal as well as political feeling, and his election was hotly contested, the second and third ballots showing a majority for his most serious competitor, M. Pams. On appeal to the National Assembly, however, he was ultimately elected by a majority of 187 votes over M. Pams, his inauguration taking place on Feb. 18 amid great demonstrations of popular enthusiasm. Two days later he showed that he intended to exercise the right of the President to address Parliament direct—a right which had fallen into desuetude—by sending a message to the Chambers, in which he stated that it was his function as President "to be a guide and adviser for public opinion in times of crisis" and "to seek to make a rational choice between conflicting interests." His activities as President were still directed to strengthening the internal and external position of France. In June 1913, after inspecting the fleet at Toulon, he paid a State visit to England (24-27), during which he enlarged on the necessity of the perpetual association of the two nations "for the progress of civilization and the maintenance of the peace of the world." In the autumn he made a motor tour of the south of France,—being greeted everywhere with popular acclamation, the bands playing the irreverent march "Sambre et Meuse,"—and attended the army manœuvres at Toulouse. His State visit to Spain followed in October.

The President's activity and enormous popularity roused the anger of the Opposition parties, and the Radical-Socialist congress at Pau, on Oct. 17, passed a resolution condemning "the aspirations of personal policy." This had no effect, how-

ever, on public opinion, and Poincaré's popularity was undiminished during the months immediately preceding the outbreak of the World War. On the very eve of the war, immediately after the rising of the Chambers on July 15 1914, Poincaré set out on a State visit to Russia and the Scandinavian countries, arriving at Kronstadt on July 20. His visit to Sweden was, however, interrupted by the serious news from France, and on the 29th he was back in Paris. He now made a personal appeal to King George V. to use his influence in favour of peace, while the Ministry asked for the armed intervention of Great Britain. After the outbreak of war his activities were mainly directed to stirring up the patriotic spirit of the people, as in his messages to the Chambers of Aug. 4 1914 and Aug. 5 1915, or his speech on July 14 1915 on the occasion of the transference of the remains of Rouget de Lisle, the composer of the "Marseillaise," to the Invalides. On Oct. 4 1914 he also visited the French head-quarters.

After the conclusion of the Armistice Poincaré made a tour in Alsace and Lorraine, his official entrance into Metz taking place on Dec. 4 1918. On Jan. 18 1919 he opened the Peace Conference in Paris with a short speech, in which he emphasized "justice" as the guiding principle of the victorious Allies. His term of office expired on the following Feb. 18. He subsequently accepted the presidency of the Reparations Commission, which he resigned in May 1920 as a protest against what he considered to be the undue leniency shown to Germany. This became the text of a violent press campaign which he carried on, against the policy of the Supreme Council in general and of Mr. Lloyd George in particular (see FRANCE: History). During 1920 and 1921 it was Poincaré's influence that was mainly dictating the aggressiveness of French feeling in international politics; and during the latter part of Briand's premiership, culminating in Briand's visit to the United States for the Washington Conference at the end of 1921, it was Poincaré who was fomenting the criticism that French interests were being undermined. The result was seen when, in the midst of the Cannes Conference in Jan. 1922, the proposal for an Anglo-French treaty of defence led to Briand's hasty return to Paris to answer interpellations with regard to his policy in the Chamber, and to his sudden resignation on Jan. 13 without facing discussion on a vote of confidence. Poincaré was at once entrusted by President Millerand with the formation of a new Cabinet, which he completed on Jan. 15, and French policy under his premiership was now given a definitely Nationalist orientation.

Poincaré's published works include *Du droit de suite dans la propriété mobilière* (1883); *Idées contemporaines* (1906); *Questions et figures politiques* (1907).

See Henry Girard, *Raymond Poincaré* (1913); *Raymond Poincaré, a sketch* (1914); *Larousse Mensuel*, No. 158 (1920).

**POISON GAS WARFARE.**—The use of poisonous gases in warfare, as started during the World War, was only made possible by modern progress in chemistry. From a purely objective point of view, and apart from all ethical considerations, it should be observed that fighting-men have, at some time or other, adopted any means of making war, however ruthless. Poisoned weapons and poisoned wells are as old as history. The ancient Greeks indeed used sulphur fumes, and the Byzantines "Greek fire"; and in mediaeval sieges carcasses of dead animals were thrown over the defences from mangonels, in order that their putrefaction might spread disease. Underground warfare in all times has been marked by attempts to drive the enemy from his galleries with smoke and suffocating fumes. The usages of chivalry, while prescribing courtesy to prisoners, imposed no limit on means of destroying life. Only in the 18th century, when war in western Europe became a very formal affair, did a tendency appear to set such limits. Both Louis XIV. and Louis XV. declined the use of "infernal liquids" offered to them by chemists. Later the tendency to impose moral restrictions became more definite. Lord Dundonald's proposal for the use of asphyxiating smoke-clouds at the siege of Sebastopol was rejected by the British Cabinet. In 1865 at Châlons experiments with asphyxiating shells were made on dogs before Napoleon III., who

stopped the trials and declared that such barbarous means of destruction would never be employed by the French army because they were against the "law of nations." In the S. African War of 1899-1902, the Boers thought they were justified in complaining of the injurious effects of the gases given off by the British high-explosive shells. It was only indirectly that the Hague Convention limited the use of gas. It forbade, by Art. 23 (c), the use of weapons calculated to cause unnecessary suffering; "poison or poisoned weapons" by Art. 23 (a). A separate declaration had, some years before (July 29 1890), forbidden the use of projectiles whose "sole object it was (*qui ont pour but unique*) to spread deleterious or asphyxiating gases." The method which actually arose in the World War—that of a fixed apparatus which propels liquid gas in a jet—had apparently not then been generally foreseen. If it had been, the use of poisonous gases would, no doubt, have been more explicitly forbidden.

It is one of the ironies of history that the first great war after the Hague Convention should have witnessed its entire uselessness to limit human suffering. Gases of a nature to cause lifelong injury, liquid fire, molten metal, burning phosphorus—all were employed with a prodigality limited only by the inventive powers of the combatants.

There was, of course, no objection to the use of gases and substances of the lachrymator class. The object of these is to cause temporary incapacity by violent smarting of the eyes, sneezing or retching, while the effect passes off when the subject is removed from the radius of action of the gas. Probably the earliest example of this class is the Chinese "Stinkpot"; and it is interesting to note that as the Chinese were before the Western nations in the use of gunpowder, so they also were in this early form of what, in the World War, came to be known as "Chemical Warfare," a term which in itself is really too wide for "gas warfare," since chemistry enters into explosives also.

At the time of the Russo-Japanese War the subject of lachrymators was taken up by the Japanese, and later by the British War Office. It was also investigated by the French for police purposes. The British experiments covered a wide range of compounds based mainly on iodine, bromine and picric acid. The chief subjects of inquiry were effectiveness, keeping qualities and the effect of the liquid on the container. Nothing very highly effective was found, and it appeared that most of the liquids required a container of lead, glass or porcelain, on account of their action on steel or cast iron. The experiments were dropped some years before the World War, probably because, in the kind of warfare that was then anticipated, it did not appear that there would be much use for lachrymators.

In 1913 the question was submitted again to the British War Office. The Hague Convention was always kept in view, and it was considered that the term "deleterious" applied only to gases which caused permanent harm. As one chemist pointed out, poisons were prohibited by the convention, but disagreeable fumes were not. A few experiments were made with compounds of the lachrymator class in shells, and the question remained alive until in Sept. 1914, after the outbreak of war, it was decided not to use chemical shell of this type for the British army or navy.

Quite early in the World War stories began to be current on each side of the employment of gas shells by the other. In Dec. 1914, upon a semi-official suggestion from the British G.H.Q. in France, a section of the War Office, working with Sir William Ramsay's Chemical Sub-Committee of the Royal Society, took the question up again. By this time trench warfare was fairly established and the armies of both sides were immobilized in trenches, facing each other in some places at a distance of only a few yards. All possible means of trench fighting had to be considered, and among other things it was thought that, if a sufficient number of lachrymating grenades could be thrown from the British front trenches into those of the enemy, he might be forced to evacuate them temporarily, or might at least have his fighting power considerably reduced by being forced to the constant use of a protective mask.

In Jan. 1915, an idio-acetate compound was brought forward which caused such smarting of the eyes that it was impossible to

remain in its neighbourhood. By that time catapults were available which could throw a 2-lb. projectile 200 yards, a distance which brought the enemy's trenches within range in many parts of the line. A tinned iron cylindrical grenade was therefore designed to hold 2 lb. of liquid, which by means of a 5-second time-fuze and detonator was made to burst and distribute the lachrymator in a fine spray. The British War Office and G.H.Q. approved of this grenade, and the manufacture was put in hand. At the same time many other substances were considered, mostly lachrymators and sternutators. Some of these compounds appeared to be very effective under experimental conditions, but were not so in the field.

While these modest tentatives were proceeding, always within the limits laid down by the Convention and the Declaration, the first German gas attack took place on the Ypres front on April 22 1915. This immediately altered the whole situation, as it was obvious that in using chlorine—an asphyxiant—the Germans had transgressed, if not the letter of the Declaration and the Convention, certainly their spirit. Accounts of the sufferings of those who had been exposed without protection to this new form of attack roused great indignation, but its effectiveness could not be ignored, and after a few days it was decided by the British authorities that preparations at least must be made to reply to the German gas offensive in the same manner. The section of the War Office that had been dealing with lachrymating grenades was instructed to take up, the question, and with the aid of two or three chemists of the highest standing a small council was formed which sat continuously to discuss ways and means and consulted all the most prominent chemists and manufacturers. It soon became evident that the Germans had employed chlorine gas discharged under pressure from cylinders placed in the front line of trenches. A rapid review of all possible means of reply showed that chlorine was the easiest gas to begin with, but the position of Great Britain in this matter was very different from that of Germany. For the ordinary processes of the dye industry, the Germans produced in peace-time very large quantities of liquid chlorine. In England only one or two firms produced it, and that in very small quantities. Moreover, the available containers for transport of the chlorine were not only very few but were much too bulky and heavy for use in the field. The problem therefore was twofold: first, to install apparatus for an enormously increased supply of liquid chlorine, and secondly to design and manufacture suitable cylinders or dischargers for its use in the field. In both cases many initial difficulties were encountered, which were overcome in due course, and on Sept. 25 1915, at Loos, the first British gas attack with chlorine took place.

Meanwhile a very large range of possible gases had been passed under review with the object of discovering substitutes for chlorine. Obviously the thing to aim at was something which was more directly lethal than chlorine, and at the same time would cause less suffering by its effects. It was also realized from the first that the discharge of gas from the front trenches necessitated waiting for suitable weather conditions, which was very inconvenient for the arrangement of tactical operations; and it appeared to be necessary to release the gas in the enemy's lines, so as to be independent of wind, which could best be done from gun shells or trench-mortar bombs. The principle was approved and a new class of problems had now to be faced.

*Effects of Gases.*—At this point it will be convenient to consider the effects produced by different varieties of gases, and the methods of employing them.

When considered from the point of view of their physiological effect, war gases may be classed in two main divisions, (a) Lethal, and (b) Irritant. The lethals fall under the two heads: those whose action is instantaneous or practically so (specific), and those whose action is more or less delayed, and is generally of an asphyxiating character.

A gas is classed as immediately fatal when death follows exposure for a period of two minutes to a certain concentration (i.e. a certain proportion in the air breathed). A higher concentration may cause instantaneous death. The only known com-

pounds which, in concentrations practically obtainable, produce immediate death, are those containing cyanogen. The chief disadvantage of these is that when the concentration is not sufficient to cause death they have no effect at all, or only temporary faintness, headache or heart trouble. The other lethal compounds may have immediate injurious effects, such as headache, nausea, etc., and in high concentrations may cause death in a short time. In concentrations which are not strong enough to kill, they may cause casualties, which have the disadvantage that as the action is delayed a man may be able to continue fighting for some time after exposure. Thus in the case of phosgene, a man who does not notice that he has been gassed may die suddenly as much as 48 hours later.

The irritant gases are divided into (a) Lachrymatory (affecting the eyes), (b) Sternutatory (causing sneezing), (c) Vesicatory (blistering).

Lachrymators, on account of the extreme sensitiveness of the eye, can produce an effect in extraordinarily weak concentrations, such as 1 in 1,000,000 parts, or even less. Protection can be given by well-fitting goggles, but goggles cannot be used when there is a chance of exposure to lethal gases, because they would interfere with the gas-mask. The presence of lachrymators therefore entails the wearing of the complete mask, with all its disadvantages. The principal bases for lachrymators are iodine and bromine.

The sternutators were originally considered from the point of view of putting a man temporarily out of action by a violent fit of sneezing. A more important use suggested itself later, namely, that a man could be prevented by sneezing from adjusting his gas-mask, and would thus be exposed to the action of lethal shell. Similarly, if a sternutator could be found to penetrate the gas-mask it would be impossible for the wearer to keep it on. Early in the war there were many reports of the intended use by the Germans of red pepper and capsicine. Many experiments were tried by the British with capsicine and similar agents, but they did not give good results. In the summer of 1917 the Germans introduced shells filled with diphenyl-arsenious chloride (Blue Cross shell). They used a great many of these, especially on the French front, but not with any great success. In view of their effect on the wearing of the gas-mask, these irritants require further investigation.

Vesicants are only practicable when they act in vapour form. In that case they are by far the most effective of all the irritants, as they attack the skin and all the mucous surfaces. Those first considered were effective only when they reached the skin as liquids, a condition difficult to secure, and they were therefore dismissed. But the German "mustard gas," also known as Yellow Cross and Ypérite (Sym. dichlorodithylsulphide), acting as a vapour, was immediately successful. It first appeared in July 1917. It attacked the skin through the clothing, causing burns and irritation which might last from a fortnight to two months. Acting on the eyes it caused blindness, usually temporary. Acting on the bronchial tubes it might cause bronchial pneumonia. It might affect the heart, and also the stomach, causing vomiting and diarrhoea. These effects were sufficiently serious, in view of the large numbers of casualties which were produced, although the proportion of fatal cases was small, being no more than about 3%. In this connexion it should be noted that substances of the irritant class may also be lethal in high concentrations, i.e. in concentrations higher than those necessary to produce the characteristic temporary disablement.

A very important consideration in the use of gas is what is known as "persistence." Cylinder gas, travelling with the wind, is effective over a particular area only while it passes; but liquid gas splashed on the ground in minute particles from a shell, or left in the ground by the smothered burst of a shell, may be effective for some time, and gases are classed as of "high persistence" or "low persistence" according to the time during which their effect remains. This depends on the rate of evaporation. A strong lachrymator may be effective on the surface for perhaps twenty hours; other irritants, such as mustard gas, may remain effective for days in suitable meteorological conditions. Left

under the surface they may remain latent for still longer periods, and take effect when disturbed by digging. It will be understood at once that this is a question of great tactical importance. For instance, a bombardment with "high-persistence" shells of trenches shortly to be attacked would be an obvious mistake, since the attacking troops after capturing the trenches would not be able to occupy them. On the other hand, in a raid on trenches which it was not proposed to retain it would be correct to burst bombs of "high-persistence" gas in trenches and dug-outs. So also in using a gas barrage or in bombarding an area, high-persistence shells should not be used if it is intended shortly to attack over that ground. The use of vesicatory shells especially will deny a given area to both sides, or "nullify" it. Gas shell is now classified not according to its physiological effect, but according to tactical use, viz. as persistent or non-persistent, the former being used for neutralization (e.g. mustard gas) and the latter for surprise destructive bombardment (e.g. phosgene).

The questions may be asked—why use the irritant type of gases at all if lethals are available? and among the lethal gases, why not use only the most powerful, namely, those which produce immediate death? In both cases the answer is found in the question of quantity. The specific lethal gases will only produce their effect in very high concentrations, which means that a large number of shells must be used simultaneously over a certain area. Shells of other types, though they may not kill at once, will produce casualties in very much lower concentrations. The question of the number of shells to be fired to produce a given effect is of great importance, not merely from the point of view of expense and the call on manufacturing resources, but still more in the field, as regards the number of guns required to fire the shells, the exertion of the guns' crews, and the question of transport. Again, an effective lachrymator will produce an atmosphere that cannot be endured in one-thousandth part of the concentration which the lethal shell would require for its purpose. This is a matter of great importance, especially in neutralizing enemy batteries. Lachrymators rather went out of fashion towards the end of the war, not only because the great munition efforts of both sides had produced an enormous quantity of lethal shell, but still more because the neutralizing effects and harassing effects which were their *raison d'être* could be obtained better by mustard gas.

Vesicating shells, which are of high persistence and whose effect is often delayed, are specially useful against targets behind the front line. Although a trench or strong point which it is intended physically to occupy cannot be subjected to mustard-gas bombardments, the use of this substance in combination with an attack round the flanks proved very valuable in reducing defences which could not have been carried either by assault or by explosive bombardments. The possibilities also of mustard-gas barrages in defence are very great. They should be used against communications, depots, railway stations, and especially staff offices, telephone exchanges and everything that affects the enemy's organization. An entirely odourless vesicator and one which does not produce a smoke easily recognizable will be particularly effective in this way.

As a general rule both lethal and irritant shells should be used in scientific alternation. With lethals, of course, the object is to catch the enemy unprotected by his masks, and in order to get a good effect a large number of shells must be fired at once. Such effects may be specially aimed at when large numbers of troops are known to be concentrated in certain places, previous to an assault. But it is also an important object to force the enemy to wear masks as long as possible, not only to fatigue him, but to exhaust the protective powers of the mask. This can be effected with irritants, and after some hours of bombardment with these, fresh bursts of lethal shells may be tried.

*Methods of Employment.*—The study of the characteristics of gas-clouds is very complicated. The cloud may consist of true gas, or minute drops of liquid, or infinitesimally divided solid particles. The last are known as "particulate clouds," and in their behaviour resemble a colloid vapour. Their action has to be studied physically and electrically as well as chemically.

The production of cylinder clouds, of course, is simple. The critical temperature of the gas employed must be above normal temperature. The liquefied gas is filled into a cylinder with a nozzle on the principle of a soda-water syphon. The cylinder is placed in position in the trench, and the nozzle is provided with a short length of pipe, which is placed on the ground in front of the trench, and ensures that the gas on issuing is well clear of it. The valve being opened, the liquefied gas is discharged with some force, and as its evaporation causes a fall of temperature a heavy cloud is formed which travels with the wind. The necessary density of cloud is obtained by opening simultaneously a sufficient number of cylinders per unit of length of trench, other cylinders being held in reserve to continue the discharge for the time considered necessary. At first the cylinders were placed in groups against the front wall of the trench. This method had the disadvantage that a cylinder might be burst at an inopportune time by an enemy shell, and later the Germans placed their cylinders under the floor of the trench, protected by sandbags, etc., while the British placed theirs in chambers excavated at some depth below the parapet.

The earliest cloud discharges lasted only twenty or thirty minutes, or at most an hour, the necessary concentration being calculated at ten tons of the chemical per km. of front attacked per hour. By the end of 1916 the French were using 100 tons per km. per hour, and the emission was continued for three or four hours. In the course of 1918 the British Special Brigade was using 200 to 250 tons of gas per km. per hour, and keeping up the cloud for eight, ten or even fourteen hours. The transport of gas cylinders up to the front trenches was naturally extremely laborious. It was very difficult to avoid attracting the enemy's attention to the carrying and emplacement of them, and there was always the risk of cylinders being burst by the enemy's shell. The results that were achieved under such conditions testify in the highest degree to the devotion and courage of the troops employed. The enormous discharges of 1918 were effected by loading the cylinders on trolleys and running them up to the front trenches on light railways just before they were to be used. The nozzles were opened by an electric device.

On the other hand the use of gas in shells presented all sorts of difficulties from the outset. It was first necessary to find gases that could withstand the shock of discharge from the gun and the effect of bursting the shell. Some of the most lethal gases could not be utilized because they were chemically unstable, and were liable to become decomposed into their constituent elements by shock. The cyanide compounds were to some extent of this nature, so that the Germans never used them. The French discovered a stable cyanide compound in which they had considerable faith, and the British used them to a certain extent.

Some stable lethal gases were found in due course, in addition to the irritants, and a whole series of problems presented themselves. The first question was the possible effect of the gas on the material of the shell. Some gases, such as phosgene, had no action on steel or cast iron. Others required containers of lead or porcelain; the French had a very effective method of blowing a glass lining into shell. The methods of sealing the shells and of filling and closing them offered merely technical difficulties, though these were considerable. The most suitable means of opening the shell was the next question, which had to be first considered, and then practically tested. The first gas shell used by the Germans contained a large proportion of high explosive; it is not known whether the idea was to follow the Hague Declaration in that the sole purpose of the shell should not be to spread deleterious gases, or to have a "double-purpose" shell, destructive and toxic. The result, however, was to produce an inferior explosive shell, while most of the gas was dissipated by the explosion.

The British efforts were directed at first to getting the maximum amount of gas into a shell and releasing it with as little disturbance as possible. The gas-cloud would issue in the form of an oblate spheroid which travelled down the wind, gradually enlarging and being diluted by the air. Without wind the gas would remain on the surface, settling down in trenches or depressions of the ground. For opening with the least amount of

disturbance cast-iron shells were indicated, as they required practically no bursting charge; but cast-iron shells have the drawback that they hold much less liquid than steel shell, because the shell wall has to be very much thicker to resist the shock of discharge. It was eventually found that not only every gas but every nature and every calibre of shell required a different bursting charge, and sometimes a different explosive. These all had to be determined experimentally. Later it appeared that certain liquids required a more powerful burster in order that they might be distributed in a fine spray. When a solid was introduced, in the shape of diphenylchlorarsine, a still more powerful burster became necessary in order that the solid might be atomized and dispersed as a cloud. Thus the German 77-mm. shell contained only 125 gr. of this solid enclosed in a glass container, the space between the container and the shell being filled with 600 gr. of explosive.

While the output of chemical shells remained very small the question of cloud formation by lethal shells was of high importance. Not enough shells being available to charge the whole atmosphere over a certain area with a fatal concentration, it was necessary to rely on the effect of each individual shell cloud, which ought to pass over a man or group of men while still at full strength. With the very large quantities of shell that were available later this question was of less importance, as it became possible to produce and maintain very high concentrations over a given area or length of trench. This was facilitated by bringing the larger natures of shell into service, and also by the use of Stokes' bombs and trench-mortar shells, but still more by the Livens projector.

Since gas shells were intended to be used without considering the direction of the wind, the possible effect of a bombardment on one's own troops had to be considered, and a further range of experiments became necessary. The kind of precautions required are indicated in an extract from German Army Orders of June 30 1918:—

The following regulations for gas bombardment are made known. Minimum distance of the objective from our first line:—

(1) Wind normal or oblique towards the enemy: for all natures of gas shell the least distance must be 300 metres; below that distance projectiles fired short may fall in our lines. When the wind is steady and the ground favourable, this distance may be reduced if only a small number of projectiles are being fired.

(2) Still weather, or wind normal or oblique towards our lines:—  
(a) Heavy bombardment (several thousand projectiles), ground favourable for the return of the gas towards our lines:—

Blue Cross shells (Diphenylchlorarsine—sternutators) . . . 1,000 metres (offensive).

Blue Cross shells . . . 500 metres (defensive).

Green Cross shells (Trichlormethylchloroformate—lethal) . . . 1,000 metres.

Yellow Cross shells (Sym. dichloridiethylsulphide—vesicatory) . . 1,000 to 2,000 metres according to the number.

(b) Light bombardments (some hundreds of projectiles), when our troops have been warned and the ground is favourable:—

Gas shells of all natures: 300 to 500 metres. These distances are given for general guidance; they may be reduced or increased according to local conditions.

The influence of the state of the atmosphere and ground conditions on the use of gas is naturally of great importance. The first consideration is the wind. Lethal shells will produce the best effect with a wind of three miles an hour or less; with a wind of over seven miles they cannot be used effectively. Lachrymators can be used in higher winds up to twelve miles, but with diminishing effect. Heavy rain destroys gas effect. Dry weather and a bright sun tend to dissipate the gas quickly. The most favourable atmospheric conditions are little or no wind, moist atmosphere, and no sun. The night usually offers the best conditions for gas. As regards the effect of ground, it will be obvious that anything which protects the gas from the effect of wind assists concentration. Hollow ground, valleys, woods, areas covered with undergrowth, and villages make therefore good targets.

*Field Organisation.*—The earliest British experiments on a field scale were made with extemporized appliances on the nearest open ground to the source of production of gases under trial. Some experiments not involving danger were made on a ground that had been acquired for flame-projector and explosive trials

at Wembley, and at the Clapham School of Trench Warfare, but it was soon evident that a properly organized experimental ground was essential, and after much search a site was found at Porton near Salisbury. Here trenches and dugouts were made, artillery ranges prepared, and gradually a complete installation provided of laboratories, mechanical workshops, magazines, filling-rooms, gas-chambers, etc. It was now possible to experiment on a really scientific basis, while the ground available gave space for trial of many other trench-warfare requirements, among which smoke and incendiary shells and light signals were of great importance. Porton thus became the headquarters of the practical study of gas warfare. The laboratory experiments there were confined, however, to examination of the results of trials. Other laboratory work was done at the Imperial College, at Cambridge and other universities, and in private laboratories.

The first British experiments with gas-projectors showed the difficulties that were likely to arise with defective apparatus, or from changes of wind in the trenches; and it was realized at once that, for the handling of the new weapon, it was necessary to have some chemists in the front line who should be trained in the handling of the material, and who could also advise the troops on the effects of it. The suggestion of raising a Chemical Corps was put forward and approved; and as a result all the universities were invited to nominate students of chemistry, while at the front chemists were withdrawn from the ranks for the new corps. This was the beginning of the Special Brigade R.E. in which a certain number of selected students and officers already serving were given commissions, while others were appointed as non-commissioned officers to give them the necessary authority and position.

A certain number of officers and men were also appointed to it who were not chemists but had experience at the front. Thus the officer commanding the Special Brigade suggested working the men at cylinder emplacements in the trenches in pairs; one a chemist and the other an old hand from the infantry. The importance of having trained scientific men in the brigade was shown by the number of valuable suggestions that emanated from the officers, as well as by their extraordinary keenness and effectiveness in the field. After a short time selected officers from the brigade were appointed as chemical advisers at headquarters of armies and corps, and a central laboratory at General Headquarters was started for examining enemy gas and anti-gas appliances and dealing with urgent problems.

*Organization in England.*—In June 1915, upon the formation of the British Ministry of Munitions, the personnel hitherto engaged on chemical warfare was transferred to the ministry. The time had come for rapid expansion, and a Trench Warfare Department was created by the minister which was responsible for both design and supply, not only of chemical war material but grenades, trench mortars and projectiles, smoke shells, signals and the countless other requirements that modern trench warfare had made necessary. The staff, rudimentary hitherto, was increased in proportion to the requirements of experiment and manufacture, and a scientific advisory committee was formed of eminent specialists in chemistry, physics and physiology. This new department was unique in combining the functions of research, design and supply. The other departments of the ministry were concerned with supply only, in response to the demand of the War Office. It was decided after much discussion that this exception should be made for the Trench Warfare Department, because it was recognized that in dealing with so many entirely new products, the manufacture of most of which was attended by considerable danger, it was essential that the designers should be in the closest possible touch with the manufacturers, should be able to explain what was being aimed at, and should advise on difficulties as they arose. The resultant close contact enabled them also to modify their designs during manufacture when necessary; to take account of facilities for supply and manufacture; and to order supplies in advance as soon as a new production was foreseen.

There is no doubt that this was the right procedure, as was proved by the rate production up to the end of 1915. The weak

points were that the department had to communicate with the front through the War Office, which caused delays and mistakes, and that defensive arrangements, the provision of gas masks, etc., so intimately connected with offensive research, remained with the War Office. But, for the rest, the department had only to obtain the approval of the War Office for new designs and material, with an indication of quantities to be provided, and could then make its own arrangements. To this, however, one very important exception had to be made; they were not allowed to design or manufacture gas shell, and as other branches were not in a position to design them this led to serious delays. These delays were accentuated by the fact that in 1915, when shells were scarce and the value of gas shell had not been proved, the authorities responsible for shell generally were very unwilling to allocate shells to gas.

Gas warfare both in France and Russia began with divided control, and as this gave very unsatisfactory results, in each country after some time a separate organization was formed with complete control of design and supply. In the autumn of 1916 for instance, when the British were scarcely beginning to produce gas shell, Russia with her poor manufacturing resources was already sending to the front a steady supply of 25,000 gas shells a week for field guns. The British on the other hand, having begun on the right path, had left it. Within the ministry, at the end of 1915, research and supply were separated. It was assumed that they would work together as closely as before; but in fact, the Supply Department immediately and inevitably drifted away, and not only lost the advantage of supervision by the designers, but began to research on its own account, thus causing overlapping and confusion. Early in 1916 a Department of Munition Design was formed, and the Trench Warfare Research Department passed under the control of that department. Their work was then much restricted, and was directed by a department which knew nothing of it, and which intervened between them and the War Office. The confusion and friction that followed had a serious effect both on progress and output.

In the summer of 1917 the large number of casualties caused by the German mustard-gas shells occasioned some anxiety on the British front, and it was asked why the British army had not something equally effective. The reason was that since 1915 research in irritants had been discouraged; and as the Chemical Research branch was not in direct touch with G.H.Q. the question had never been properly discussed. In the result, in Oct. 1917 the Chemical Warfare branch was reorganized and considerably expanded. It had more direct communication with the front, and the Defensive organization from the War Office was amalgamated with it. The Supply Department was however kept separate.

In April 1918 the Trench Warfare Supply Department was broken up. This was the opportunity to restore the supply of gas and gas shells to the Chemical Warfare branch, especially as they already had supply on the "anti-gas" side; but the manufacture of gas went to the Department of Explosives Supply, and the filling of shells and bombs to the Department of Gas Ammunition Filling. This continued until the Armistice.

*Objects of Gas in Warfare.*—It must be clearly recognized that in the use of gas a new weapon of war has been found, which supplements without displacing the existing arms. Explosive and shrapnel shell have their limits. A very small amount of cover will give entire protection against shrapnel, and deep dugouts will protect against the most powerful explosive shell. When the enemy has provided cover and such shell become ineffective, gas becomes effective. A gas heavier than air will settle in trenches and remain in them; it will drop down the approaches to the deepest dugouts and permeate them. According to the nature of the gas, whether lethal or irritant, the enemy, if unprovided with gas-masks, will then be either killed or driven up into the fresh air. In the latter case, he comes once more under the action of the ordinary artillery shell. If he has masks he can remain under cover, but the masks must be worn, not only until the bombardment stops, but afterwards until the shelter is cleared of gas.

In trenches also, and in the open, as long as there is gas, masks must be worn, and the troops fight under a heavy handicap. This condition may be kept up indefinitely with a slow bombardment of irritants and occasional bursts of lethals. In the case of a smoke-cloud discharged for eight or ten hours continuously the protection afforded by the mask with its refills will be exhausted, and the troops attacked have three alternatives: to counter-attack, which without prearrangement and the necessary supports is hopeless, to die at their posts, or to retire.

The effect of gas differs fundamentally from that of ordinary shell in its persistence. A bombardment with explosive shell is effective only while it lasts. The moment it is over troops can move freely over the area of bombardment. With gas, on the other hand, troops cannot cross the area without masks until the gas has been dissipated.

Again, a shrapnel bullet or splinter of explosive shell may hit or may miss; troops may pass through such a barrage with considerable losses, but still in sufficient numbers to attack. The gas cannot miss. If enough has been discharged over a certain area to give the necessary concentration, every man passing over that area without a mask will be affected.

In clearing up a captured line of trenches during an advance, gas bombs are most effective for bringing the enemy out of deep dugouts. For this purpose a non-lethal irritant of low persistence, which will penetrate the enemy's mask, may be used.

There is also the question of the effect of gas behind the lines. Such a discharge of cloud-gas as has been described may travel for miles before it is sufficiently diluted to lose its destructive effect. A long-range bombardment of an artillery or engineer depot will make it impossible for some days to handle the material without good protection.

That gas shell had a real military value as compared with ordinary shell is proved by the fact that both combatants used them so freely in the last year of the World War. Thirty per cent of the total American casualties were caused by gas, and no estimate can even be attempted of the general loss of efficiency brought about by the necessity for wearing respirators. Silvevaerts gives the following German order for the proportion of different shells to be used in the bombardment before the attack on the Aisne on May 27 1918:—

Object	Explosive	Blue Cross	Green Cross
1. Counter-battery and long-range bombardment	20 %	70 %	10 %
2. Bombardment of infantry positions			
(a) Moving barrage	60 %	30 %	10 %
(b) Back barrage	30 %	60 %	10 %

Experience showed also that batteries attacked by gas shell were generally put out of action for several days.

*Future of Gas Warfare.*—Such then is the new weapon. Its potency is undeniable, as is the fact that it is effective where other weapons fail. The question is, will its use be continued? The answer, from a military point of view, may be found in the fact that, if one belligerent uses gas and the other does not, the former will in all probability win. Since experience has shown that conventions made in peace-time are not always respected when war comes, the argument that no nation can allow its existence to depend on the security of a convention prohibiting the use of such a weapon, is even strengthened by the fact that, after the lessons of the World War, nobody in 1921 could predict what further chemical or physical developments scientific investigation might produce in the future. Great advances might well be made in the discovery of gases that would penetrate any mask hitherto designed, and in the utilization of them. The nation that cares for its safety must therefore keep pace with such discoveries and with the means of protection against them. To prevent the production and the study of toxic gases is impracticable, because many of them are either necessary elements or by-products of manufactures essential to modern industries in peace-time.

As for the ethical side of the question, it must be considered dispassionately. Every new means of warfare, intensifying its

effectiveness, has caused an outcry when first introduced. Gas warfare, *per se*, is not necessarily or exceptionally cruel. For instance, if it were conducted on both sides with cyanides, successfully adapted to war purposes, the resultant deaths would be the most merciful that history has ever known. It is to be noted that in the World War less than 3% of the total gas casualties were deaths, whereas some 20% of casualties due to other weapons resulted in death either on the field or in hospital. The use of gases may be guarded by future conventions so as to prevent unnecessary suffering, just as explosive bullets were barred. Thus chlorine might be forbidden, because there is no death more painful than that by suffocation. But the utmost that seems possible is to limit by convention the use of poison gases in such a way that a breach of the convention will not place the offending combatant in a definite position of superiority.

It is infinitely to be deplored that gas warfare was ever introduced. It certainly adds a new horror to war. It imposes fresh burdens on the soldiers, who may ultimately be forced to spend most of their time in gas masks, even when far behind the lines. The most terrible thing perhaps about it is that, since it is impossible to remove all non-combatants from a zone of war, and equally impossible to provide them with masks, thousands of them must inevitably perish. For this reason alone it would be well if gases were forbidden. To forbid them, however, is one thing; to prevent their use is another. And unless more effectual means than were within sight in 1921 can be devised to make this (or any other) form of warfare impossible, considerations of national security must inevitably prevail.

*Gases used in the World War.*—The following are some of the more important gases used during the World War:—

*Cyanogen Compounds.*—Effect, in concentrations of as much as 1 in 1,000, immediate death. In weak concentrations, giddiness, headache and pains about the heart, but ultimately complete recovery. Used by the French and the British in shells as a mixture of 50% hydrogen cyanide, with arsenic trichloride, stannic chloride and chloroform.

*Chlorine.*—Attacks the respiratory tracts, forming in contact with moisture hydrochloric acid which destroys the tissues. Has a reflex action on the system generally, causing vomiting and diarrhoea. In high concentration may cause immediate death by spasm of the glottis. Only used as cloud-gas from cylinders.

*Phosgene* (Carbonyl chloride).—A very dangerous gas because the effect is delayed, and the victim is often not aware that he has been gassed. May cause sudden death as much as 48 hours after exposure. Very much used both in shells, and with chlorine as cloud-gas.

*Diphosgene* (Trichloromethyl chloroformate).—Effect similar to that of phosgene. Much used in shells, both alone and with other gases.

*Chloropicrin.*—Acts on the respiratory system like chlorine but more strongly. Is also a lachrymator. Much used in shells generally in combination with other gases.

*Bromine.*—Action similar to that of chlorine. It can be used conveniently for gas-clouds on account of its high boiling-point, but it forms the basis of a large number of powerful lachrymators. It was much used by the Germans as a lachrymator shell-filling in the form of benzyl or xylol bromide and brominated ketones.

*Ethyl iodacetate.*—British lachrymator. Very marked action on the eyes, causing the moment the neighbourhood of the gas is left. High persistence.

*Bromacelone*, *Chloracelone* and *Bromomethylcelone*.—Much used in shell. Powerful lachrymators, and asphyxiating or lethal in high concentrations. Moderate persistence.

*Diphenylchlorarsine.*—Solid, dispersed in clouds of fine particles. Cannot be kept out by ordinary masks. Powerful sternutator, producing also coughing and sickness; in strong concentration, causing insupportable headache. Much used in Blue Cross shells by the Germans.

*Diphenylcyanoarsine.*—Similar to diphenylchlorarsine, but with a more powerful action. It superseded the latter as a German Blue Cross filling.

*Mustard Gas*, *Ypélite*, or *Yellow Cross*.—(Sym. dichlorodiethylsulphide). Vesicant. Attacks the skin even through the clothing with a blistering or burning effect. Affects all the mucous surfaces. Acting on the eyes causes blindness, usually temporary. Acting on the respiratory tracts may cause death by bronchial pneumonia. In favourable weather remains effective for several days.

*Livens Projectors.*—The use of lethal-gas shells, which require a very high concentration, implies the necessity of bursting a large number of shells simultaneously along a given length of trench or over a given area. With artillery shell this necessitates a concentration of every available gun within range on the point of attack,

and needs a certain amount of preliminary arrangements. With Stokes or trench-mortar bombs whose contents are much larger, and especially with a Stokes gun which can be fired very rapidly, a smaller number of pieces can be used. But probably the most effective means of obtaining a high concentration was the projector devised by Captain Livens, R.E. This consisted originally in using an old gas cylinder, with its top cut off, as a mortar; a hole is dug in the ground and the projector placed in it, resting on the ground at an inclination of 45 degrees and pointing in the required direction; the breech of the cylinder is backed up with a strong base-plate about 12 in. square. The propelling charge is contained in a tin box placed at the bottom of the projector and divided into compartments; the propellent explosive is placed in the compartments in bags, the number of bags being varied according to the range required. The projectile is a steel drum with rounded ends, 21 in. in length and just fitting into the cylinder, which has a bore of 8 in.; within the drum is a central tube running down its length, about 1 in. in diameter, which contains the bursting charge. The projector is fired by an electric fuse, about 20 of them being connected up with an exploder. These 20 may all be placed side by side in the same trench, and will constitute a battery. By these means as many as 4,000 of these projectors have been placed in position behind the front trenches in a night and fired simultaneously. Naturally, neither range nor direction are very accurate, but they are sufficiently so to give a very high concentration of gas over a small area, in some cases sufficient to kill men even when wearing their respirators. These projectors proved so useful that they were employed also for incendiary and high-explosive charges, and were immediately copied by the Germans, who feared them more than any of the other chemical warfare methods of offence employed by the Allies.

*Incendiary Materials.*—The beginning of the war showed nothing particularly new or useful in the incendiary materials used by either side. Quite early in the war a German incendiary shell was found to contain white phosphorus and a very inflammable celluloid mixture. In England petrol bombs were tried and containers filled with rags soaked in petrol. The results were not important. Phosphorus by itself was not a reliable incendiary agent, though a shower of molten phosphorus descending from a shell burst in the air had a good moral effect.

The first demand for incendiary materials for the British army arose from the necessity of burning the long grass in No Man's Land during the summer of 1915, to prevent the enemy from using it for cover. To meet this demand a small catapult grenade filled with phosphorus and petrol was supplied, it being found that a small addition of phosphorus gave a more certain ignition of the petrol. Phosphorus, however, was far more useful as a smoke-producer than as an incendiary. A very important advance was made when a method of utilizing thermit in shell was discovered. Thermit is a mixture of iron oxide and aluminium which when ignited by a suitable primer burns with an intense heat, which has been estimated at 5400° Fahrenheit. It is used commercially for welding, and has been used in the army for such purposes as destroying guns, a small quantity of it being placed in the bore and ignited; the result of this is to make the gun useless, as when the thermit cools it is found to be firmly welded to the surface of the bore.

The ordinary ignition, however, is too slow for the purpose of an incendiary shell. Experiments were made with special ignition powders in Stokes shells but without good result. In Jan. 1916, however, thermit was tried with a bursting charge of ophorite which gave excellent results, the thermit being instantly raised by the discharge to melting-point so that when the shell was burst in the air it fell a shower of molten metal. Ophorite was an explosive that had recently been discovered by Professor Thorpe, which while less powerful than the ordinary high explosives, had the advantage that it could be fired by a fuse without a detonator.

Thermit employed in low-velocity projectiles such as Stokes gun shells became a very valuable incendiary agent; with artillery shells it was not so useful, as satisfactory ignition was difficult to obtain.

Experiments were also tried with fine coal-dust distributed in the air but the results were not practical.

*Anti-gas Defences.*—About the end of March 1915, in consequence of the increasing rumours that the Germans intended to use poison gases, the British War Office asked Sir William Ramsay's committee to consider what gases might possibly be used, and what would be the best means of protection. Before the committee reported, the cloud attack of April 22 was made. The circumstances were explained to Sir William Ramsay by telephone, with the remark that the gas was probably chlorine, and the next morning he came to the War Office with several sample mouth-pads made of flannel or wool soaked in hyposulphite of soda. An appeal was made through the Press to British women to furnish 1,000,000 of them at once, and thanks to their response and the efforts of the Red Cross the necessary quantity came in two or three days, so that within a fortnight every man

in the British army at the front was supplied with this form of respirator. Although rudimentary, it gave useful protection.

Meanwhile chemists and physicists were at work on both the French and British fronts investigating the facts and advising on temporary protection. The day after the first gas attack, instructions were issued to keep buckets of solution of bicarbonate of soda in the trenches; the men were to dip their handkerchiefs in the solution and tie them round their mouths in case of gas attack. More efficient respirators were considered, also the use of large fans for clearing the trenches of gas, and direct fighting of the cloud by spraying neutralizing agents into it. Thousands of Vermorel sprayers were sent out, for clearing trenches and dug-outs. The dispersal of clouds by shelling and by explosions was tried, also lighting fires in front of the trenches to heat the cloud and cause it to rise. None of these methods were really effective in stopping clouds, and attention was gradually concentrated on direct defence by masks.

The first improvement on the respirator, which was introduced in the War Office a few days after the attack, was known as the Smoke helmet or Hypo helmet, a kind of Balaklava helmet made of flannel or thin serge, covering the head loosely and reaching below the neck, round which it was tied. The eye-pieces were made of mica. This helmet was impregnated with hyposulphite, soda and glycerine solution, and carried in a waterproof bag. It gave satisfactory results for some time. Pending the complete supply, the increasing use of lachrymating shells by the Germans gave rise in June to a demand for goggles.

During 1915 the helmet was improved by the introduction first of phenates to protect against phosgene (when it is called the P helmet) and later by the further addition of Hyomine (when it was called the P.H. helmet), to ensure protection against phosgene and prussic acid. A respiratory valve and mouth-tube was also inserted in the P. and P.H. helmets, and this added to their comfort and efficiency.

As the use of other gases was foreseen, such as phosgene and hydrocyanic acid, a more effective protection than could be put into cloth became necessary. Thus the "box respirator" type was developed, and gradually issued during 1916. The general type of these consisted of a mask or face-piece into which entered a flexible tube issuing from a metal container which held chemicals, through which the air was breathed. In the earlier patterns the air passed through the tube into the space between the mask and the face; but as it is very difficult to get the mask to make an airtight fit round the face, the tube was extended and ended in a mouth-piece which fitted closely to the lips, while the nostrils were closed by a nose-clip. The container and mask were carried in a knapsack. The mica eye-pieces were replaced by celluloid, and eventually by triplex glass, which does not splinter when broken and remains airtight.

The introduction of a container for the neutralizing and absorbing agents gave free scope to chemists to provide against all kinds of poison gas. In this connexion it is worth recording that the British gas-mask did in fact give efficient protection from its introduction to the end of the war.

The containers were filled with alternate layers of charcoal and composition granules. The charcoal absorbed gases, and the granules, whose composition could be varied indefinitely, absorbed and neutralized them. The container had the further advantage that its contents could easily be renewed.

This type of respirator continued in use until the end of the war but was subject to continual improvement. No effort in this direction could be spared seeing that any defect in the manufacture or adjustment of the mask might mean death to the wearer. Constant progress was made with the British and French patterns, and the Americans when they entered the war took up the question very thoroughly. They, like the French, had the advantage that their chemical service was a separate branch of the army with the offensive and defensive sections working under the same head. Among other defects the air-tight fitting of the mask to the face needed a great deal of study and experiment. The eye-pieces gave trouble because moisture would condense on them both outside and in. This was partly cured by

using a soapy solution on the glass. The whole apparatus had to be made as little cumbrous as possible, and so adjusted with its knapsack that it could be very quickly taken out and put on. The use of the mouth-piece and nose-clip was very trying when worn for long periods.

In 1918, the Tisset mask was introduced in France, which did away with the mouth-piece and met the difficulty of condensation by causing the cold air from the inlet-tube to pass across the eye-piece in entering the mask. This type, which was adopted and improved by the Americans, was known as a "single-protection" respirator. Its weak point is that if the face-piece is torn, or does not fit properly, protection is lost.

The provision of the charcoal for the containers opened up a wide field of investigation. For absorbent purposes a very dense charcoal was required. Experiments made in the United States showed that coconut-shells gave the best form of charcoal for the purpose, but their preparations were on such an extensive scale that they calculated that they would require a supply of 400,000 tons per day of coconut-shell, which were obviously not obtainable. After coconut-shells the best carbon was obtained from fruit-stones such as peach, cherry, etc., and Brazil and other nut-shells. Carbon obtained from hard wood, such, as the ironwood was of less efficiency.

The scale on which the United States worked is shown by the following figures given by Farrow of the production of protective materials up to the date of the Armistice, the great bulk of which were produced in the last four months of the war:—

Material.	Production up to Nov. 11 1918.
Respirators . . . . .	5,276,515
Extra canisters . . . . .	3,144,415
Horse masks . . . . .	366,529
Bleaching powder (tons) . . . . .	3,677
Extra antidimming (tubes) . . . . .	2,855,776
Sag paste (tons) . . . . .	1,136
Dugout blanket oil (gallons) . . . . .	95,000
Protective suits . . . . .	500
Protective gloves . . . . .	1,773
Dugout blankets . . . . .	159,127
Warning devices . . . . .	33,202
Trench fans . . . . .	29,977

The sag paste mentioned in this list was an ointment used for the skin to protect it against mustard gas, the protective suits and gloves being for the same purpose. The blankets, which were to seal the doors of dugouts, were made of specially woven cotton treated with a specially heavy oil. The warning devices were mainly watchmen's rattles and Klaxon horns.

From the beginning gas schools were established on all army fronts, where men were taught the use of the masks and made to enter gas chambers with masks on to get proof of the protection afforded. Similar schools were established by all the nations at their gas defence headquarters, where experiments could be tried. The result of such work is well shown by the following extract from Farrow's description of the American gas service:—

"There was a special field-testing section of the Gas Defence Division composed of about 150 men who were trained to the minute in field manoeuvres and did most of their work in gas-masks. They were constantly in and out of gas with regular production and experimental masks. They played baseball in them, they dug trenches, laid out wire, cut wires, and fought sham battles at night, both with and without actual gas. The work of this section even went so far in the case of the later design as to include a test where six men worked, played and slept in the masks for an entire week, only taking them off for 30 minutes at each meal-time, and each day entering high concentrations of the most deadly gases without any ill effects whatsoever to the wearers. When it is remembered that eight hours was the limit of time which a strong man could wear the old-type mask, something of the efficiency of the new mask may be realized."

These of course are experimental results with selected men, which generally differ widely from those obtainable in the field. They only show the great improvement made in patterns of respirators before the end of the war. The fact remains that any efficient respirator is a source of fatigue as well as a great inconvenience. British experiments have shown that in hill-climbing with and without respirators, there is a marked difference in the increase of heart rates, and rates of breathing under the former

condition. Up to 1921 what had been done gave good protection with reduced inconvenience. But much yet remained to do; indeed, complete protection both at the front and in the rear areas might well be unattainable. (L. J.)

**POLAND** (see 21.902) — The partition of Poland was the one great crime of the 18th century for which no redress was afforded by the settlement of Europe after the Napoleonic wars, and it eventually proved one of the causes of the World War in 1914, though the Poles had become apparently more or less reconciled by that date to working out their destiny under Russia, Prussia and Austria. In the earlier article their history has been sketched up to 1863, but it is necessary here to make some brief reference to former times as well as to give the outlines of its development from then up to 1914.

**RUSSIAN POLAND.**—"The insurrection of 1863," says Stanislaus Kosmian, "helped the greatest enemy of Poland and the Polish cause to success. On the ruins of the Polish revolution rose . . . the system of Russification in the Empire of the Tsar." Under the new name of the Governments of the Vistula the Polish provinces formerly known as "Congress Poland" or the "Kingdom of Poland" were placed in the hands of military governors whose duty it was to suppress every tendency towards Nationalism and to ensure complete subservience to Russia. Russian became the official language of the country and it was enforced in all public business. In 1869 it was adopted as the official language of higher and secondary education and in 1885 the use of the Russian language became compulsory in the primary schools. The publication of articles in Polish was forbidden and the teaching of the language was punished by fine and imprisonment. In 1876 Russification was extended to the courts of justice and Polish officials were replaced by Russians. It cannot however be said that the policy was consistently enforced; it was for instance mitigated under Count Berg who succeeded Milyutin in 1867 and devoted himself to conciliating Polish society, and again by Count Schuvalov and Prince Imeritinsky, successors to the Draconian Gen. Gurko who reigned from 1883 to 1894. Roman Catholicism was, however, from the first recognized as "the backbone of Polish Nationalism" and consistently attacked. At the outset the monasteries were closed, the ecclesiastical lands confiscated and the Union with Rome assailed by compelling Uniates to become Catholics. This religious persecution was carried on with very slight intermittence until 1905, when religious freedom was first permitted.

The most interesting feature in the process of Russification, however, was the attempt made to break the power of the old historic families and bring the peasants into close union with Russia. The emancipation of the peasants which had been urged before the revolution was effected by the Ukases of 1864. Each peasant, whatever his tenure had been, and the mass of the landless became freeholders, which was a constant cause of class friction, and they were allowed to retain their right of free access to the forests and pastures of the landlord. To the landlords compensation was given in the form of Treasury Bonds so that they might have a lasting interest in the maintenance and solvency of the Russian Empire. Village affairs were placed in the hands of a Commune (*Gromada*) consisting entirely of peasants, who from ignorance and inexperience soon fell under the influence and mastery of the officials; while the landlords were represented in the organization of the district.

The basic idea of the system was the accentuation of class divisions, for it was hoped thus to create a class independent of, and antagonistic to, the Polish landlord and bound by ties of gratitude to Russia. These hopes were not realized for it was these peasant communes which provided centres for the educational movement at the end of the century and foci for the spread of the idea of Polish nationality.

From the emancipation of the serfs can further be traced the economic changes which took place in the latter half of the 19th century. By the splitting-up into small parcels of the large estates an ever increasing class of peasant proprietors was instituted because the small freeholders, who included in their numbers members of the smaller gentry or *Schluchta*, as well as

the former serfs, desired to increase their holdings and found themselves more and more able to pay the prices demanded by the landlords. Though the kingdom of Poland was and remains essentially an agricultural country, a great industrial change has also taken place. Whereas in 1863 the towns were still in a primitive state of development, by the end of the century great industrial centres had appeared. Competition with Russian industry was a different thing to competition with German industry, especially under the protection of the Russian tariff wall. Hence the growth of a strong middle class in which the Jews took a considerable part, some of the leading Jewish families even marrying into and being received as part of Polish society in Warsaw. The economic development became a strong bond of union with Russia and Polish textiles penetrated through the empire as far as Turkestan.

The practical exclusion of the Poles from the Russian army and administration threw back the abler and more ambitious of the upper classes among them on other employment, and strengthened this middle class and brought a new influence to bear on national life in Congress Poland. Hence practical economic reform improvement became the order of the day and the habit of theorizing on the subject of political independence fell into the background. But these improvements again could not long avoid a political aspect and hence the formation of Socialist and Democratic associations.

These Socialist societies, however, had always a Nationalist tendency because capital was largely in German and Jewish hands. The most noteworthy was the National Democratic party which came into existence before the end of the century, after several earlier revolutionary societies had failed, and set to work by means of private educational efforts to oppose Russification and definitely awaken the spirit of nationality. During the troubles which succeeded the Russo-Japanese War this party, under the leadership of M. Dmowski, formed "the army of the national movement" and in the First Duma held an important and in the Second a controlling position, but its influence was diminished by the reduction of the membership at the election of the Third Parliament. Outside Russia an important movement took place in 1908, thanks to the rise of the Neo Slav party, which aimed at effecting a reconciliation between Russia and Poland, and this platform was adopted at Pan Slav Congress held at Prague in 1908, for it was felt that the Poles would be the first victims of a victorious advance of Germany, now the most dangerous enemy (it was held) of the Polish cause.

The Russian Government was, however, recovering from the blows of the revolution of 1905 and unwilling to consider the grant of autonomy for Poland, and in the Duma even the support of the Constitutional Democrats was withdrawn when the Polish Club in the Austrian Reichsrat encouraged in 1908 the incorporation of Bosnia and Herzegovina with the Habsburg dominions. The failure of its plans caused the break-up of the National Democratic party. Its place was taken by Socialist societies antagonistic to Russia. Hence at the outbreak of the World War feeling in Russian Poland was divided.

**PRUSSIAN POLAND.**—The Congress of Vienna in 1815 had stipulated that the Poles should receive "a representation and national institutions." In the duchy of Posen the national rights of the Poles were recognized and for some years the policy adopted by Prussia was one of conciliation rather than oppression, while the needs of the country, such as those as to education and communications and the emancipation of serfs, were efficiently provided for. It was not till 1830 that any system of Germanization was introduced and even that was enforced with no great severity for the twenty years after 1851. But when Bismarck was able to turn his attention from Austria and France to Poland he found that under the mild rule that had prevailed the Poles had been able to develop a national movement which had indeed a parliamentary group in Berlin and had to be reckoned with in the Reichstag, but the strength of which lay in societies such as that founded by Marcinkowski in 1842 which had brought an educated class of Polish doctors, lawyers, merchants and tradespeople into existence. By means of propaganda this movement

\* These figures indicate the volume and page number of the previous article.

had increased rapidly to a position more formidable than that previously engineered by the historic families and was in fact "undermining the foundations of the Prussian State." As a counter-stroke to an organization which he realized was strengthened and to some extent led by the priests, Bismarck in 1872 undertook the *Kulturkampf*, hoping thereby to crush out the growing conception of Polish nationality. The Archbishop of Gnesen-Posen, the chief leader of the Roman Catholic party, was imprisoned, the liberty of the pulpit was denied, the use of the Polish language was prohibited in the schools and attempts were made to forbid its use at public meetings. The *Kulturkampf* was continued till 1885 and in spite of its failures Bismarck's policy seemed assured of success when Dindorff was appointed Archbishop of Gnesen and the onslaught of the schools began.

The history of Prussian Poland in later years turns to a great extent upon the economic question. The industrial development of Germany had brought about a great immigration of Polish labourers to work as agriculturists in eastern Germany and as miners in Westphalia. Bismarck desisted danger here and after unsuccessfully trying to prevent it by expelling the immigrants essayed to counteract it by further Germanization of Poland. The appointment of the Land Commission in 1886 with £5,000,000 to buy land from Poles in Posen and W. Prussia and sell it to German colonists was the first step in the policy of German colonization which was pursued till the outbreak of the war. It is true that under Caprivi the severity of the anti-Polish policy was relaxed, but under Prince Hohenlohe it was reinforced and in 1894 the *Ostmarken Verein* was founded to obtain the trade of the eastern provinces exclusively for Germans and undermine the Polish element. Under Count Bülow the culminating point was reached in 1908 when the compulsory expropriation bill was passed with the bill prohibiting the use of Polish at ordinary public meetings. More colonists were now introduced and the sale of their land to Poles was forbidden. There were signs all through of the failure of this policy, such as the strike of the school children in 1906 against the use of the German language in religious instruction, and these signs were multiplied in the economic sphere. For here the Poles, acting on the principle that they would be masters when they were "better, more educated and richer than the Germans," had definitely set themselves to the task of defeating the Germans economically. The land that was bought for colonists was poor land and bought at high prices. The German colonists were boycotted to such an extent that they were forced to withdraw or become Polonized and the Polish position actually seemed to grow stronger as the legislation became more severe. The incorruptible Prussian official, the inexorable Prussian schoolmaster and the brutal Prussian drill sergeant had disciplined a talented people hitherto uncultured and rendered them capable of organizing and acting for themselves. By means of their cooperative societies which dealt with agriculture, finance, industry and commerce they obtained complete control of the resources of the country to the exclusion of the Germans and the Jews. They also founded unions of landowners, social, athletic and political associations. The heads of all these societies before the war formed a sort of secret Cabinet which exercised the chief power in Prussian Poland with a preponderating influence in the local Press, with power to control the supply of immigrant labour and secretly direct the boycott both of Germans and of Jews. In fact when victory came the assumption of political supremacy was not the first but the last step to complete independence.

The success of the Poles of Prussia may have been one of the elements which led Pilsudski to put his money on the wrong horse at the beginning of the World War, believing that Germany would be obliged to make of Poland a buffer State against the eternal menace of the Russian Empire.

AUSTRIAN POLAND.—The lot of the Poles in the Austrian Empire with its purely non-national basis was preferable to that under Prussia or Russia. In the former they had by fighting obtained a tolerable position. In the latter the severities were intermittent and could be mitigated by bribery. In Austria there was always a certain amount of *bonhomie* or *Gemütlichkeit* which made official

harshness tolerable. The history, however, of Austrian Poland from 1863 to 1914 can be understood only by reference to certain governing facts, namely the imperialist opportunism of the monarchy and the racial problem presented by the rise of the Ruthenian movement in Galicia.

During the years immediately following the revolution of 1863, the Galician Poles, under the influence of bitter disillusionment, resolved to concentrate all their efforts not on recovering political unity with the boundaries of 1772, but on preserving and strengthening national unity within the Austrian Monarchy. German culture and the German language constituted the unifying and predominant force in the Habsburg Monarchy, but after the war of 1866 and under the constitution of 1867 Austrian Germans had to look for allies amongst the other nationalities. The Poles had to decide whether they would support the aims of the Federalist party with its disruptive tendencies or whether they would favour the German element and adhere to the Vienna Government. They followed the latter course and promised loyalty in return for practical concessions. Having 57 votes in the Reichsrat they were able to secure useful privileges for Galicia. In 1867 they obtained a special minister for Galicia in the Austrian Cabinet; a separate board for Galician education; the use of the Polish language in secondary schools; the use of Ruthenian being restricted to elementary schools; the use of Polish instead of German in administration and the law courts. In the following year Polish became the official language for the university of Cracow, whilst a year later it was enacted that Poles alone should be teachers in the universities of Cracow and Lemberg. From 1877 onwards the "Polish Club" in the Reichsrat became a governmental party and used all its influence to build up piecemeal the fabric of Polish autonomy in Galicia. On the whole the Poles did not use their power well. By the establishment of an academy of science at Cracow they did indeed encourage learning, but they did nothing to improve the economic condition of the people. The peasants remained ignorant and the towns were neglected. No Polish middle class was created and hence the Jewish element predominated in trade and commerce. Galicia was rapidly Polonized but only at the expense of the Germans and the Ruthenians, and on their oppression of these last the history of Austrian Poland up to and after the war to a great extent depends.

The Ruthenians have been described by Prof. Alison Phillips as a compact body of 30,000,000 occupying the country "from the north-eastern district of Hungary across the Carpathians and E. Galicia" and eastwards as far as the Dnieper. They were then ruled partly by Russia and partly by Austria, but have always been claimed by the Russians as part of their race. Indeed little doubt was expressed on the subject till a movement was started about the middle of the 19th century by certain Ruthenian scholars, who set out to prove they had a right to a separate national existence. The real impetus of the movement was economic and arose from the discontent of the peasant with the oppression of their Russian and Polish landlords. It was some 20 years before the importance of the danger of the movement was realized. From the Polish point of view it was dangerous because it challenged their supremacy in "the annexed provinces" in Podolia, Volhynia and Eastern Galicia. From the Russian point of view it was disastrous because it threatened to break up the Russian Empire. In Galicia, where in addition to the language the Greek Uniat Church formed a strong bond of union, the movement prospered in spite of the Polish efforts to suppress it, which were at first supported by the Austrian Government. This support continued as long as Austria desired good relations with Russia, that is until in 1884 it was desired to weaken the Russian colossus. Then concessions were made to the Ukrainians and the result was that in 1891 Ukrainophil deputies appeared in the Reichsrat with the development of an Ukrainian State within the monarchy inscribed on their banner. This policy had the effect of promoting a reconciliation between Russia and the Galician Poles, who thought it better that the Galician Ruthenes should be absorbed by Russia than that a Ruthene State should be set up at the expense of both Russians and Poles. To retain their ascen-

dancy, therefore, the Poles proceeded to encourage the Russophil Ruthenians, with the result that the latter were successful in 1907 in the election which followed the establishment of universal suffrage in the Austrian half of the Dual Monarchy.

In 1908 the Neo Slav Congress definitely declared that Russian Neo Slavs and Poles should act in conjunction to suppress the movement, a decision which met with no approval from the Austrian Government because Russia and later Austria were then at daggers-drawn in the Balkans and a new viceroy was appointed in Galicia who was definitely anti-Russian. The culminating point was reached in 1914, when it was discovered that the Ukrainian party was and had been for ten years past in close touch with the Prussian *Ostmark Verein* which was opposed to everything Polish. The Galician Poles had realized the complete subservience of Austria to the German Emperor and this produced a great change in their attitude to the Habsburgs, so much so, that the murder of the Archduke was received with almost indecent expressions of satisfaction, because to him was ascribed the success of the Ukraine movement in 1913.

**POLAND DURING THE WORLD WAR.**—Thus the declaration of war in 1914 found the Poles with no definite national policy. The various political parties were united in that they had one common end in view, the restoration of an independent Poland, but their opinions were divided as to the means of attaining this end. In Galicia the majority of the Poles were pro-Austrian. In Russian Poland the National Democrats, under the leadership of M. Dmowski, were strongly in favour of working for an autonomous Poland under the Russian crown, and this policy seems to have been supported by the majority of the Russian Poles. In opposition to this party was a strong anti-Russian element, of which the most notable supporter was Pilsudski. Having been forced to flee from Russian Poland in 1907 Pilsudski had taken refuge in Galicia, where he had utilized the *sokols* (athletic clubs) and shooting clubs for the purpose of organizing an efficient military force to use against Russia in case of war. At the outbreak of war he mobilized his forces, as the Polish Legion, and, advancing across the border, seized Kielce. The actual military result was of no great importance, but "it soon became clear that his bold decisive action had powerfully impressed the national mind."

On Aug. 14, in answer to the anti-Russian campaign which the Germans had been organizing in Warsaw, the Grand Duke Nicholas issued a proclamation announcing Russia's intention of establishing a united Poland "under the sceptre of the Russian emperor," a Poland which was to be "free in faith, language and in self-government." By the National Democrats this proclamation was welcomed as being the first stage towards the fulfilment of their aims. By the followers of Pilsudski, however, the proclamation was received with no favour: proposals for conciliation with Russia tended only to emphasize Polish divisions.

Polish resistance to the Russians took a political as well as a military form. On Aug. 16 two existing Polish organizations, the Confederation of Independent parties and the Polish Military chest (*skarb*), were merged in the Supreme National Council of Galicia, which contained representatives of all parties in the Galician Diet and Reichsrat. Though the National Council was formed with the object of offering political resistance to the Russians, it was not altogether in agreement with Pilsudski and his legionaries. It was inclined to be monarchical whilst Pilsudski was Socialist Republican. Accordingly the Council laid down the following regulations: The Polish legions were to form a separate Polish command but to be subject to the Austrian Army Command. The Polish language was to be used. Legionaries were to take the Austrian Landsturm oath and F. M. L. Durski, a Pole in the Austrian service, was placed in command. Pilsudski, having taken the oath under protest, was given the command of the first regiment.

At first both the Austrians and the Germans distrusted the movement as they stood to lose should Pilsudski achieve the national independence for which he was working. Austria moreover was hostile to any idea of Polish union and to anything which might lead to increased autonomy in Galicia. Recruiting, therefore, was forbidden. Later the Germans, realizing that the

strength of Russia would be decreased as the strength of the Polish legions was increased, allowed recruiting to take place among the Russian Poles.

The Galician situation, however, was somewhat changed by the Russian advance. On Sept. 2 Lemberg was taken by Russian troops and for the moment "the Austrian solution was at a discount." The divisions among the Galician Poles became apparent. By some, who had ties of blood and religion with the Russians, the invasion was welcomed and the new rule accepted with alacrity. The most noticeable effect of the pro-Russian sympathy is to be found in the dissolution of the E. Galician Legion, which took place in Oct. and which caused an estrangement between the Conservatives of the National Committee and the E. Galician Conservatives. Bobrinsky was appointed governor of Lemberg, his policy being that of systematic Russification.

In 1915 the Polish situation was again changed by the military campaigns. On June 22 Lemberg was retaken from the Russians and on Aug. 5 the Germans entered Warsaw: thus German power was established in Russian Poland and Austrian power reestablished in Galicia. Among the Poles themselves, in 1915, party differences seemed to decrease. In Dec. the Radical Socialist elements formed a central national committee. It was composed of the Peasants' party; the Union of Workers; the Polish Socialist party and the Club of Polish Statehood (*Studenicki*). The aim of the league was to work for independence; it was dissolved in Feb. 1917.

By the beginning of 1916 the Polish Legion was well equipped and in June the brigades totalled 18,000. When the Polish independence parties at Warsaw asked for the nomination of Pilsudski as the commander-in-chief of a Polish army all the concessions previously granted by the Germans were withdrawn. Pilsudski then appealed to the Austrians. The Austrians' ideas with regard to Poland had undergone a slight change, and though suspicious of Pilsudski and his legionaries, the Government decided to encourage them in the hope that a union might be effected of the Polish kingdom and Galicia under Austrian protection. In July Pilsudski felt himself in a position to appeal for concessions regarding the substitution of Poles for Austrians as officers in the legion, and for the use of the Polish uniform and colours. There was some delay in considering the question of these concessions and as a protest Pilsudski, together with other officers, retired. The Austrians did make and were prepared to adhere to certain concessions. They therefore negotiated with Pilsudski to withdraw his resignation. At this point, however, the German command interfered and Pilsudski was dismissed on the grounds of insubordination. In Oct. the legions were withdrawn from the front.

The Germans and Austrians were in the meantime trying to arrive at some satisfactory solution of the Polish question. The tendency of the Poles themselves was on the whole pro-Austrian, this tendency being strengthened by the union of the province of Chelm (Kholm) to Poland. The first solution proposed by the Germans was that of an independent Polish state under a Habsburg king. This state was to consist of Russian Poland, Galicia, and those parts of Posen where the Poles exceeded 65% of the population. This solution the Austrians would not accept. It was not clear how much of Poland the Germans were willing to give up, but it was clear that their sacrifice would not be so great as that of the Austrians who were to lose all Galicia. The solution proposed by the Austrians was that of a genuinely independent Poland consisting of Galicia and Russian Poland. This new Poland was to be a third co-equal state with Austria-Hungary. The German Chancellor then issued new proposals and after a Polish deputation had been sent to Berlin to discuss the terms an agreement was brought about and the result was the Decree of Independence of Nov. 5. By this decree the Polish districts "snatched from Russian power" were to form an independent state which was to have a hereditary monarchy and a constitution. The organization, training and command of the Polish army were to be settled by mutual agreement.

From the point of view of the Germans the Polish state was to be closely united to the Central Powers, "especially in military

matters." Their ultimate aim was to secure additional manpower against Russia. This settlement was not welcomed by Austria. She "had accepted unwillingly the German scheme as to Poland . . . but she hoped by her scheme of Galician autonomy so to embarrass the German settlement as to revive the Austrian solution which Berlin had rejected."<sup>1</sup>

The independence of Poland was acknowledged on Dec. 20 by a joint Allied note and later in 1917 it was acknowledged by the Revolutionary Government in Russia.

The first attempt of the German Government to organize the new state was not successful. General von Beseler (primarily a *savant* and geographer), who as military governor held the chief power, issued a decree arranging for the election of 70 members of the Diet in the German sphere of occupation; eight members of the Council of State were to be chosen by these 70, whilst four others and the chairman were to be chosen by the governor-general, all resolutions of the Council of State were subject to the assent of the two governors-general. The unpopularity of this proposed organization was so great that certain modifications were introduced, and the following scheme adopted: the two Governments were to nominate immediately a council of 25, 15 from the German sphere and 10 from the Austrian; they were to elect their own chairman; they had power to regulate internal affairs and economic reconstruction and were to cooperate in the formation of a Polish army. The Council was composed eventually of 11 Conservatives, but no National Democrats, 8 of the Central party (pro-Austrians) and 6 of the Left (Socialists). It was liable to be over-ruled by von Beseler.

The powers of the Council were fairly extensive. "Education and justice were handed over to them practically without reserve; and for the first time for many years the native tongue was again heard in the schools and in the courts of law. Local representative bodies were called into being in the towns and in the country; and in Warsaw the municipality received control of all the public services, including police, prisons, posts (municipal), public sanitation and hygiene."<sup>2</sup> The finances were handed over to the Council "except in so far as the costs of the occupation" were concerned. A Minister of Political Affairs was appointed but he might hold official relations only with the Central Powers.

One of the first problems facing the new Council in 1917 was that of the economic reconstruction of the country. In his *History of the War*, John Buchan gives the following description of the condition of Poland under the German domination—"The German policy demanded a wholesale destruction and . . . Poland was methodically laid waste. . . . Only blackened ruins marked the site of villages, and since the German army ate up all supplies, famine stalked through the land. . . . The material damage can scarcely be estimated. . . . all labour and industry have been swept away." In addition to the devastation, the currency was depreciated and the Customs, which might have provided revenue, were to go to Germany and Austria.

The Council was responsible for the drawing up of a constitution. A committee was formed in which all shades of opinion were represented. It was decided that a Ministry and a Senate should hold office until a genuine National Assembly could be established. As regards political matters the Council demanded that there should be a regent: that they should be given more control over local government; and that existing ordinances should be modified. These demands were not accepted by von Beseler.

The chief question which occupied the Council was that of the army. Pilsudski was attempting to raise a strong national army which would give the Council more chance of enforcing its decisions, but he was not prepared to raise it for German use.

The meeting of Council in which the political demands were formulated took place on May 1. Only unimportant concessions in education and justice were made; therefore on May 17 the Council suspended its functions, though through German intimidation it was forced to resume them on June 9. At the beginning of July three resolutions were passed, proposals for a regency,

a Cabinet and a Senate were accepted, a military oath was to be taken exacting loyalty to the Central Powers and to the future king of Poland (thus excluding a republic), and a recruiting appeal was made. These resolutions proved the submission of the Council to Germany, and in protest Pilsudski and five of his supporters resigned.

After the passing of these resolutions on July 3 the Council was discredited. It had failed to cope satisfactorily with the economic crisis and it had failed to produce a practical settlement with regard to the army. As matters stood the army could be used against the Russians but not against the Austrians or the Germans. Finally the Council was discredited by the attitude of the Austrian Poles. The Government had delayed the grant of increased autonomy to Galicia and on May 28 the resentment of the Galician Poles culminated in a conference of Polish members of the Galician Diet and of the Austrian Reichsrat, in which they declared that "the desire of the Polish nation was to have restored an independent and united Poland with access to the sea." On July 30 Polish discontent was further increased by the arrest of Pilsudski, and a month later the Council resigned.

After the failure of the Council a regency project was introduced. By this scheme there was to be a regency of three, a Cabinet and Premier and a Council of State. The Premier and the Council of State were to be chosen by the Regency Council subject to the approval of the Central Powers. The functions of the Polish authorities were limited to education, justice, public welfare, agriculture, and finance as far as it concerned the departments assigned to their care. They might legislate on matters handed over to them but the German and Austrian governors-general had the right of veto within a fortnight of the completion of the bill. The regency had no control over the army.

Such was the position of the Polish Government at the beginning of 1918. The German domination seemed more complete than it had ever been before. In 1916 the Poles could extract concessions from the Germans in view of the fact that their help was needed against the Russians. That help was no longer necessary, therefore concessions were no longer forthcoming.

When the negotiations opened at Brest Litovsk the Polish Government asked the Central Powers to admit its representatives. In spite of "weighty declarations" made at Berlin the demand was ignored and the Poles were excluded from the conference. On Feb. 9 the Treaty of Brest Litovsk was signed. As far as Poland was concerned the important clause of the Treaty was that which ceded Chelm to the Ukraine. On Aug. 17 1917 the Provisional Government of Russia had recognized Ukrainian autonomy. The Ukrainian state was composed roughly of the following territory: the western parts of the Governments of Lublin and Grodno, and the whole of the Governments of Kiev, Poltava, Kherson, Volhynia, Kharkov, Podolia, Yekaterinoslav, and Chernigov and excluded the Austrian Ukraine. On Nov. 20 1917 the Ukraine declared itself to be a republic and on Jan. 11 1918 the delegates of the Ukrainian Republic were formally recognized at Brest by the Central Powers. The territory of Chelm, which was ceded to the Ukraine at this Treaty, had been handed over to Poland by Austria only in June 1916, but its ownership had been disputed for many years and it had already before been in the possession of the Poles.

As a protest against the lack of consideration shown them at Brest the Cabinet, under Kuchazewski, resigned and the Poles issued a formal protest against the violation of their rights. This, however, made little difference to the German policy, which demanded that Poland should "completely give over all those greater hopes which might be inconvenient to Germany." This policy was emphasized later in the year when Adml. von Hintze in a speech to the Reichstag proposed an economic union with Poland on the basis of a Customs union or *Zollverein*, that is to say on the basis of free trade between Poland and Germany.

In April the Poles made a statement of their programme at the Congress at Rome. They declared their aim to be "Reunion into one independent state of all the Polish lands, including those which the Central Empires are refusing to restore to Poland, and those which they are bestowing as largesse on their vassals." It

<sup>1</sup> Nelson's *History of the War*, xviii., 123.

<sup>2</sup> Butler's *The New Europe*, p. 113.

was not, however, until the autumn that it seemed possible for them to achieve the end at which they were aiming. In Oct. it became clear that the union of the Poles no longer depended on the wishes of Vienna and Berlin, but rather on the will of the Polish people. In the same month a national Polish Diet was convoked, and in Austria all the Polish parties left the Reichsrat and formed the National Council in Cracow, until there should be "a freely elected Parliament of a United and Independent Poland." On Nov. 10 Pilsudski, having been released from Germany, arrived in Warsaw and the Council of Regency proclaimed that the German occupation had ceased to exist.

**AFTER THE ARMISTICE.**—The predominating figure in the evolution of the new Polish state was that of Pilsudski, who, on the abdication of the Council of Regency, took the Government of the country into his hands and succeeded in overcoming the internal and external dangers which faced the country after the German collapse.

Pilsudski was by birth a Lithuanian Pole. In 1885 as a student of medicine at Kharkov University he became connected with the Socialist movement and three years later was banished for complicity in the attempt on the life of Alexander III. though in reality he had been strongly opposed to the plot. In 1893 he returned to Poland and became one of the chief founders of the Polish Socialist party in Russian Poland. The aim of this party was the independence of Poland. In 1900 he was arrested on account of his socialistic writings but he escaped to London, after simulating madness, and two years later returned to Poland. At this time he and his associates "adhered to Socialism because they recognized in it the only powerful revolutionary and democratic force of our time and their supreme aim was, by revolutionary means to win Polish Independence."

In about 1904 Socialism in Poland became a wide popular movement. Pilsudski was responsible for organizing the military element in the new party. Primarily this took the form of the "Fighting Organization" but later systematic military instruction was given by means of Rifle Clubs, with the object of establishing a force which would be used in armed revolution against Tsarist Russia. The war gave them their chance and at its outset they fought against Russia, for "the fight against Tsardom had become to them a second nature." In 1915, however, Pilsudski stopped recruiting for his Legions, his aim being not to raise an army which was to be used for the purposes of Germany and Austria, but one which would ultimately become the army of an independent Poland. With this object in view Pilsudski created the "Polish military organization." This organization was carried on secretly and was concerned chiefly with spreading propaganda in favour of a struggle for a Poland independent both of Russia and of the Central Powers. In 1916 after conflict with the Austrian commanders Pilsudski sent in his resignation. The Austrians refused to allow his resignation but when he withdrew his brigade from the front without any previous warning, the Germans insisted upon his dismissal.

After the declaration of Polish independence Pilsudski was called upon to help in the formation of a Polish army, but this he refused to do, on the principle that a Polish army must not be formed without a true Polish national Government to direct it. In the summer of 1917 he demanded concessions from the Germans, and, in view of the feeble attitude taken up by his colleagues, he withdrew from the Council, at the same time ordering his followers in the Legions to refuse to take the oath. As a result about four-fifths of the Legion were disbanded. He was arrested subsequently by the Germans and imprisoned at Magdeburg. During his imprisonment the Polish military organization continued to develop secretly and when Pilsudski was released by the German Revolution in Nov. 1918 this organization formed the basis of the Polish army.

When Pilsudski returned to Poland in Nov. he found the country confronted with serious dangers. There was no effective Government, the Council of Regency having been dependent upon German control; the anarchy in Russia threatened to spread into Poland, and finally the danger was augmented by the 30,000 rebel German troops which were still in the country. On Nov. 14

the Council of Regency abdicated, leaving the supreme power in Pilsudski's hands. His first work was to establish an army on the foundations laid by the Polish military organization. Through the prompt formation of the army the danger from the German troops was removed and the Bolsheviks were temporarily held back. Pilsudski's next work was to constitute a Government. "Only a Left government," it was well said, "with a programme of constructive democratic reform, could retain authority in the State. Pilsudski therefore formed the Labour Government of M. Moraczewski, and so forced the Left in this critical hour to undertake positive work instead of fruitless opposition and chaotic revolt."

At the end of 1918, therefore, Pilsudski had become the head of the Polish State. The fundamental principle which underlay his policy throughout this period was that of pushing on the Polish State in the "path of modern organic social and political life." He realized that it was social reconstruction, not social unrest, which would consolidate the new state and enable it to hold its own against the anarchic elements which threatened its existence. In the *New Europe* in June 1920 Pilsudski's achievements were thus described: "Socialist, agitator and Leader: Brigadier-General in the Austrian Army: Head of the Polish State: the changes are kaleidoscopic. He has now undoubtedly ranged behind him the great majority of the Polish people, including some of his old enemies, the National Democrats; and this success is one of the greatest tests of his ability, because Poland contains at least a score of political parties."

The first political event of importance in 1919 was the formation of a new Cabinet under M. Paderewski. At the beginning of the year there had been elements of discord between the Government at Warsaw and the Polish National Council which had been formed during the war in Paris, and of which M. Paderewski was the most prominent member. At the beginning of Jan., however, an agreement was made and when M. Moraczewski resigned his office as Premier, Paderewski succeeded him. The chief difficulties which faced the new Cabinet were that of the Bolshevik advance and the economic condition of the country of which the worst feature was famine.

At the beginning of Feb. a general election for a Constituent Assembly was held, and resulted in a victory for the non-Socialist parties, supporting Paderewski. The actual figures are reported to have been: Ministerial party 400, Socialists 80, and Jews 15.

In the summer of 1919 Paderewski, as Premier, was responsible for laying the Treaties of Peace before the Polish Parliament. The terms concerning Poland were briefly as follows:—Poland received the larger part of Posen and part of W. Prussia. A plebiscite was to determine the settlement of Masuria and Upper Silesia. Danzig was to be a free city under the protection of the League of Nations. This city was to be included within the Polish customs frontiers and its foreign relations and the protection of its citizens abroad were to be entrusted to Poland. "Poland also received the right of freely using and of developing and improving all water-ways, docks, and wharfs within the territory of the free city; and the control and administration of the Vistula river, and, subject to some restrictions, of the railway, postal and telegraph systems of Danzig." The actual details were to be settled later by a treaty between Poland and the free city. A provisional boundary was laid down between Poland and Russia, roughly corresponding to the course of the Vistula. In addition to these territorial changes, it was agreed to embody in "a treaty with the Allied and Associated Powers such provisions as may be deemed necessary by the Powers to protect the interests of inhabitants of Poland who differ from the majority of the population in race, language or religion," and also "such provisions as they may deem necessary to protect freedom of transit and equitable treatment of the commerce of other nations."

The clauses concerning Danzig, and the plebiscites for Masuria and Upper Silesia could not fail to be met with disfavour in Poland as the territories were claimed as being Polish either historically or ethnographically. Moreover, the Poles resented the suggestion that they would oppress the national minorities in the country, and felt that the inclusion of this clause was unnecessary.

In spite of these objections, the Peace Treaty was passed by the Parliament on Aug. 1 by 285 votes to 41.

At the end of Nov. a bill was drafted with proposals for a new constitution. It was proposed:—that the vote should be given to all citizens of both sexes over 21; that the National Assembly should be elected every four years; that there should be a bicameral form of Government, the Senate being quite small; that the President should be elected every seven years and that his powers should be considerable. The actual constitution was not finally drawn up, however, until March 1921.

In Dec. a political crisis took place, resulting in the resignation of M. Paderewski. It was decided by the Allied and Associated Powers that Eastern Galicia should be given autonomy for 25 years under the protection of Poland, after which settlement was to be made by plebiscite. Although the majority of the inhabitants of Eastern Galicia were Ruthenians the Poles claimed the territory and this decision of the Powers caused an outcry in Warsaw. Paderewski's explanations carried no conviction and he was forced to resign. On Dec. 15 it was announced that M. Skulski would form a Ministry.

During 1919 the Poles, with Gen. Pilsudski as their commander-in-chief, were engaged in three wars. Two of them, with the Ukrainians and the Czechoslovaks, were not of great importance. Hostilities were started with the Ukrainians on account of the disputed territories in Galicia. At the beginning of the following year a settlement was made after which the Poles and the Ukrainians joined forces to fight the Bolsheviks. The dispute with the Czechoslovaks was also on the subject of disputed territory. The duchy of Teschen, though small, is valuable because of its coking-coal and thriving industries, and for this reason both Poles and Czechs were anxious to possess it. In the summer of 1920 the dispute was settled by a decision of the Council of Ambassadors, which awarded to the Czechs the whole mining region and the chief railway running through the territory. As a result the town of Teschen is cut in two.

The third and most important war was that with the Bolsheviks. The war was caused by the German troops evacuating the eastern territories in a way which was contrary to agreement and which allowed the Bolsheviks to occupy the territory before the Polish troops could be brought up. The local population in the occupied zones appealed to the Poles for aid and, as a further advance seemed imminent, the Poles were forced to fight. The Poles have been accused of entering into this war with the Bolsheviks with imperialistic and aggressive aims. It seems clear, however, that this was not the case. The Polish army was small and was engaged in hostilities elsewhere and the financial and industrial condition of the country was such that unnecessary war would not be undertaken.

The policy of the Allies throughout 1919 was vacillating. At first direct military intervention was attempted but was given up. Later ammunition and war materials were sent to Denikin and Kolchak. Finally the "barbed-wire" policy was suggested, in which Poland was to play a leading part among the states which were to act as a barrier round Russia. This policy, however, lasted only 28 days.

In the autumn the Bolsheviks were prepared to make peace, on Poland's terms, and an armistice was suggested. M. Paderewski was advised by the Allied Powers to refuse these terms and to continue fighting. By the end of the year no further negotiations had been proposed.

During 1920 Poland "served as the centre of the resistance to the spread of Bolshevism," and her political history is very much bound up with her military history. In the spring there were some more peace negotiations, but as before these came to nothing. On April 27 a strong Polish offensive was begun, chiefly to the S. of the Pripiet marshes. The Poles advanced rapidly, capturing guns and war material, and on May 8 they entered Kiev. The Bolsheviks, owing to the defeat of Kolchak and Denikin, were now able to concentrate all their forces against Poland and in May opened a counter-offensive campaign. There was serious fighting between the Dnieper and Dvina and the Poles were forced to retreat.

In June a change of Government took place, a non-party Government being formed by M. Grabski. In view of the continued retreat of the Poles the Premier was sent to the Spa Conference to ask for help from the Allied Powers. In July Lord Curzon, as representative of the British Government, proposed negotiations on the basis of the acceptance of the provisional boundary laid down by the Peace Conference, corresponding roughly to the boundary of the Governments of the Vistula. On July 20 these terms were refused by the Bolsheviks.

In Warsaw another change took place in the Government, a War Cabinet being formed, which consisted of M. Witos, M. Daszynski, M. Grabski, M. Skulski, with Prince Sapieha as Foreign Minister. The policy of the new Cabinet was "to defend the full independence of the Polish Republic and conclude a just and lasting peace."

The Bolshevik advance had, in the meantime, been steadily continuing and by Aug. 14 they were within 12 m. of Warsaw. Even if Warsaw had fallen it is possible that the Poles might have made a successful resistance, based upon the western province of Posen, which is in many respects the most important province of the new state. The end of July and the beginning of Aug. saw further attempts for peace. On July 30 Polish officers were allowed to cross the Russian lines to conclude an armistice but they were forced to return with nothing accomplished as they were not authorized to sign the preliminaries of peace with which the Bolsheviks presented them. At the beginning of Aug. a peace conference at Minsk was arranged. As made known to Mr. Lloyd George the chief terms proposed by the Bolsheviks were: the reduction of the Polish army to 50,000, together with a small civic militia; the surrender by the Poles of all arms and war materials with the exception of those necessary for the reduced army; and the demobilization of all war industries.

Owing to Russian procrastination the peace conference was not held until Aug. 17, by which date the military situation had changed with remarkable rapidity. The Russians had advanced too fast and too far and were not prepared for any sudden counter-offensive. When Gen. Pilsudski, therefore, organized a general counter-attack the Bolshevik armies collapsed and retreated in disorder. By Aug. 21 the Poles had entered Brest Litovsk.

When, on Aug. 17, the conference opened at Minsk it was discovered that there was a difference between the terms actually offered by the Bolsheviks and those previously transmitted to Mr. Lloyd George. The terms relating to the civic militia were considerably enlarged. It was in reality to take the form of a force of armed trades-unionists, 200,000 strong and organized after the regular Soviet pattern. In short it was an attempt to foist Bolshevism on to Poland. The military situation, however, made it impossible for the Russians to enforce their terms.

In Sept. negotiations were moved to Riga, where on Oct. 12 the final treaty was signed. In the N. Poland obtained direct access to Lettland on the Dvina above Dvinsk. The Poles obtained Baranovichi, Pinsk, Kovel, Rovno and the whole extent of the Baranovichi-Rovno railway. With these boundaries the area of the new state is about 148,000 sq. m., and the population about 30 millions, but of this no accurate estimate can be yet formed. Poland ranks as the sixth state of Europe in size and population, and is by far the most important of the new states which the war has produced in eastern Europe.

In addition to the war with the Bolsheviks Poland was concerned with other foreign affairs. The treaty between Poland and Danzig was signed in 1921 but in the meantime there was "an unhappy amount of friction between the Poles, the Germans of Danzig and the British High Commissioner representing the League of Nations." The Poles in Danzig were frequently mobbed and in the summer of 1920, during the crisis in the Bolshevik war, guns and war material sent from the Allied Powers were held up in the port by the people of Danzig.

After Sept. 1920 there was friction with Lithuania. When the Bolsheviks retreated from Vilna both the Poles and the Lithuanians claimed the city, the Poles on the grounds of the language and population, the Lithuanians on the grounds of historical tradition. The Lithuanians at first took possession of

Vilna but later Zeligowski with an army of White Russians turned out the Lithuanians and established an independent Polish Government.

**THE JEWISH QUESTION.**—One of the most important questions to be considered by the new Polish State is that of the Jews. Numerically they form roughly one-seventh of the population. In Warsaw a third of the population are Jews: in many provincial towns four out of every five inhabitants are Jews and in some nine out of ten, and of these the vast majority are Eastern Jews who in language, religion and customs differ from the population. Their language is Yiddish, a Middle-High German dialect; for the purposes of writing, Hebrew characters are used. Their dress is peculiar to themselves and their unclean habits and low standards of conduct "are neither European nor modern." The Western Jew is the more civilized type which is generally found in western Europe, speaking the language and conforming to the habits of Western civilization.

The Eastern Jew is essentially a business or commercial man, but rarely a producer. He is usually a middleman or intermediary. In towns the majority of the shops are owned by Jews, but they are a race apart, hated and despised by the rest of the population, devoted to their religion, which is a primitive type of Judaism.

The Jews have been settled in Poland between 800 and 1,000 years so that they can hardly be considered "strangers" in the land, in fact the Slavs cannot be considered very much more native than they. It was not, however, until about 20 years ago that the present quarrel between the Jews and the Poles began. The Tsarist Government drove the Jews out of Russia but gave them exceptional advantages in Poland. These Litvaks (as they were called) openly professed themselves the partisans of Russia and founded the Jewish press which set to work openly to fight against Polish autonomy. The Poles attacked the Jews before the war by means of a national boycott, the only means by which one subject race could attack another. During and after the war the hostility to the Jews was increased by the fact that in the German occupation the Jew was the willing tool of the invader, and by the close connexion between the Jews and Bolshevism. The hostility to the Jew was marked in 1918 and 1919 by excesses in which some 200-300 have in fact been killed, but which have been enormously exaggerated by the Jewish press.

The following recommendations for the future treatment of the Jews in Poland were made by Sir Stuart Samuel in his report on his mission to Poland (Cmd. 674, 1920):—"That the Polish Government be urged to carry out the clauses of the Minority Treaty of June 28 1919, in a spirit of sympathy with its Jewish subjects. That a genuine and not a "masked" equality be accorded to the Jewish population of Poland. That all outrages against the person and property of the subject, irrespective of race or religion, should be promptly punished and the names of the delinquents published. That the Jews in E. Galicia be restored to their official positions in the same manner as non-Jews have been. That no restrictions should be placed upon the number of Jews admitted to the universities. That a decree be published declaring boycotts illegal, and ordering all publications advocating boycott to be suspended. That all prisoners in internment camps be brought to immediate trial and that humane treatment be assured to all interned prisoners. That facilities be afforded for the introduction of new industries into Poland with a view to converting a larger proportion of the Jewish population into producers. That the British Government should assist Jews wishing to emigrate from Poland by providing facilities to proceed to countries such as Palestine, Canada, S. Africa, Algeria and S. America, or any other country desiring to receive them. That banks be established possessing the confidence of the Jewish public, so that money might be deposited therein instead of being carried on the person or concealed in dwellings. Finally, that the desirability of a secretary who understands and speaks Yiddish being added to the staff of H.M. Legation at Warsaw be considered.

Capt. Peter Wright, in his very valuable and interesting report states (Cmd. 674, 1920, pp. 17-36) that the great majority of the poor Jews are of the Eastern type and extreme orthodoxy (Chassidim). They form an immense mass of squalid and helpless poverty and Capt. Wright's only recommendation is that the richer Jews should study the condition of the poor Jews who either trade as small middlemen, as hawkers or touts, or labour as unskilled, or almost unskilled, and fill the sweating dens as sweaters or sweated when they emigrate. They are driven into all sorts of illicit and fraudulent practices and in England, in the East End of London, too large a proportion of convictions for such offence can be laid to their account. They are unfit for the modern economic world for want of education and for Western society because of their habits and want of cleanliness. They are devoted to their strange old religion but as they grow rich their piety, as the Chief Rabbi told Capt. Wright, is destroyed by wealth and they take too little interest in their poorer brethren. No one who knows Poland can be surprised at the Polish attitude or the desire of the Poles to be rid of this corrupting influence.

**POLAND IN 1921.**—It was still impossible in the autumn of 1921 to make any final or definite statement with regard to the boundaries of Poland, as regards Lithuania the situation remained unsettled, and it was only in Oct. that a decision favour-

able to Poland in respect to Upper Silesia resulted from the award of the League of Nations (*see SILESIA*).

Working on the principle of national rights it was attempted at the Peace Conference to make the boundaries of Poland conform to ethnographic divisions. A commission was appointed, under M. Cambon, which was to deal with the Polish question and submit drafted proposals to the Supreme Council. The first report of the commission concerned the western boundaries, the proposals being as follows:—"The larger part of Posen and Upper Silesia should be transferred to Poland, "leaving Germany the western, predominantly German-speaking districts of both territories." According to the German census of 1910 the Poles formed about 65% of the population in the two areas ceded to Poland. In addition Poland was to be given "the central and eastern zones of the province of West Prussia, including both banks of the lower Vistula and Danzig," though racially the latter was distinctly German. The settlement in the case of the district of Allenstein, that is to say the southern zone of E. Prussia, was to be referred to a plebiscite.

These proposals were not accepted without modification, as it was urged by Mr. Lloyd George that they were terms to which the Germans would never agree. In the first place a modification was made with regard to the territory round Marienwerder on the E. bank of the Vistula. Instead of being transferred to Poland outright this territory was to be subjected to a plebiscite. More important, however, was the change introduced in the matter of Danzig. It was decided that Danzig and the small adjacent district were to form a free city under the protection of the League of Nations. Poland received the right of freely using all the waterways, docks and wharfs and was to have the control and administration of the Vistula river. Later a third modification was made with regard to Upper Silesia, when it was decided that in this territory too there should be a plebiscite.

The results of the plebiscite in the Marienwerder and Allenstein districts were in favour of Germany, a result which was largely due to the number of Germans who were imported into the territory. The plebiscite in Upper Silesia was likewise in favour of Germany as a whole, though in many districts there was an immense Polish majority.

The southern boundary of Poland is that of Galicia. In the N.E. the boundary between Poland and Lithuania was still unsettled in 1921 and the Poles were still in possession of Vilna, the capital of Lithuania.

With regard to the eastern boundary between Poland and Russia nothing definite could be settled at the Peace Conference as there was no recognized Russian Government with which to carry on negotiations. In order to facilitate the work of the Warsaw Government in organizing local administration in the part of Russian Poland which was certain to be ceded by Russia, a provisional eastern boundary was proposed which would include all the territory which might be regarded as having "an indisputably Polish ethnic majority." All the territories to the W. of this line were to belong unconditionally to Poland, whilst the territories to the E. were to be settled by future negotiations with Russia. Roughly speaking this provisional boundary corresponded to the old boundary of the Governments of the Vistula. This provisional boundary has since become known as the "Curzon Line." When the Poles appealed, in the summer of 1920, for help against the Bolsheviks an attempt was made by the British Government to secure peace. Lord Curzon, acting on behalf of the Government, proposed the acceptance of this line as the basis of the peace terms. The Poles being unwilling to sacrifice lands which were inhabited by an incontestably Polish population would not agree to this settlement and were later, at the Treaty of Riga, able to conclude peace with the Bolsheviks on more advantageous terms.

As finally settled at Riga on Oct. 12 1920 the line of the eastern boundary is as follows: Starting from the border of Latvia the line takes a south-easterly direction to Dzisna (Disna), thence S. passing very slightly to the W. of Dokszycze (Dokshitsi); it passes some 30 km. W. of Minsk and, farther S., 90-95 km. E. of Pinsk; it proceeds almost due S. and then slightly S.W. to Ostrog; for

some 40 km. it continues in a south-westerly direction and then goes almost due S. again till it reaches the river Zbrucz; the boundary follows the line of this river until it reaches the Dniester, which separates Poland from Rumania.

**Constitution.**—Poland is a Republic. The legislative power is given to a Diet and a Senate, which are summoned, adjourned and dissolved by the President. The Diet is composed of paid members elected for five years, upon a system of proportional representation. Suffrage is universal—all who enjoy full civic rights and who are over 21 being qualified to vote, but, since voting is personal, soldiers on active service are excluded. Citizens over 25 are eligible for election to the Diet with the exception of members of the Civil Service, who cannot be elected for the district in which they hold office. The minimum age for voting in senatorial elections is 30; whilst no one under 40 is eligible for election.

Bills go to the Senate after being passed by the Diet and if no objection is raised within 30 days the bill becomes law. Amendments are considered and voted on by the Diet. With regard to finance—a budget is fixed each year for the following year; taxes and customs duties can be established only by law and a supreme court of control superintends the management of state finance.

The executive power is exercised by the President and a council of ministers who are responsible for his official actions. He is elected for seven years by the National Assembly, that is, the Diet and Senate acting together. Laws are to be signed by him and by the President of the Council and the minister concerned. The President has the supreme power in the army, except in time of war when the Minister for War is responsible for all military affairs. The President can declare war and make peace only with the consent of the Diet. He has the right of pardon.

For purposes of administration Poland is to be divided into palatinates, districts and urban and rural communes, these forming the units of local government. Economic autonomy is established by means of chambers of agriculture, commerce, industry, etc., which will together form the Supreme Economic Chamber of the Republic, the competence of which required further legislation.<sup>1</sup>

Judges are nominated by the President whilst justices of the peace are popularly elected. Judges can be removed from office only in certain legal cases and following a judicial decision. All citizens are equal in the eyes of the law, protection of life, liberty and property being assured to all inhabitants. State protection is given to labour and insurance for unemployment, illness and accident is guaranteed. Roman Catholicism is the recognized religion of the country but others are allowed provided they are in accordance with the law.

Land must be cultivated from the point of view of public utility. The law is to decide to what extent citizens and independent associations may cultivate the land and exploit its mineral wealth, and in what cases the state may repurchase property to improve the value of its production.

#### POLAND IN 1921

**Population.**—It was still impossible in 1921 to give any accurate statistics with regard to the Polish population of Poland, etc., since the establishment of the new state. The following are the statistics of 1910.

Russia:—	
Kingdom of Poland	9,100,000
Lithuania and Ruthenia	2,438,000
Empire	400,000
	11,938,000
Austria Hungary:—	
Galicia	4,672,000
Spitz Orava, etc.	200,000
Teschen	235,000
Bukovina	30,000
Other provinces	36,000
	5,179,000
Germany:—	
Posen	1,291,000
W. Prussia	604,000
E. Prussia	286,000
Silesia	1,338,000
Westphalia, etc.	580,000
	4,099,000
Different countries of Europe	100,000
Europe	21,376,000
Outside Europe:—	
N. America	3,100,000
S. America	100,000
Other parts of the globe	30,000
	3,230,000
Grand total	24,606,000

<sup>1</sup> A law was passed by the Diet in 1919 providing that the state should buy land from the nobles and distribute it to the Polish peasantry. Owing to the want of money the law has hitherto been in suspense. The execution of this law might eventually fall under the Chamber of Agriculture.

**Economic Development.**—In considering the economic development of Poland the following territories are included: the kingdom of Poland, parts of E. and W. Prussia, Posenania, Silesia and Galicia.

**Agriculture.**—The majority of the people of these lands, with the exception of Silesia, were engaged in agriculture before the war; the percentage being 56.6 in the kingdom of Poland, 54.1 in Posenania, 49.9 in W. Prussia, whilst in Galicia there were 71 agriculturists per square kilometre.

Arable land predominated. The most important crops were rye, oats, barley, potatoes, wheat and sugar-beet. Agriculture was most highly developed in Prussian Poland where the latest agricultural implements and scientific manures were employed. The breeding of domestic animals, especially horses, showed distinct progress before the war. In the kingdom of Poland pig-breeding was particularly encouraged. Cattle and pigs were most numerous in Posenania and W. Prussia while in Galicia the horned stock were well up to the average for Austria in general.

Of the percentage of area under forest, there was in the kingdom of Poland in 1909 some 18%, in Galicia (1912) 25%, in Posenania 19%, W. Prussia 22% and in Upper Silesia 28%. In E. and W. Prussia more than half the forest area belonged to the state, in Posenania about a third, in Silesia only about 12 per cent.

The kingdom of Poland had 17 agricultural syndicates in 1909, for selling agricultural products and buying machinery, manures, etc., the most important of these being the Central Society of Agriculture, founded in 1907. These societies were most developed in Prussian Poland, particularly in Posenania, where in 1913 there were 388 Polish agricultural societies. There were also numerous co-operative societies. Galicia also possessed agricultural, co-operative and mutual insurance societies.

**Minerals.**—The most important production in Galicia was that of petroleum, which was estimated, in 1914, as being 3% of the world's output and 9% of that of Europe, including Russia. The petroleum industry has attracted an abundant flow of international capital and has thus been able to adopt every device for profitable exploitation.

The chief coal-fields are those of Silesia where the production in 1911 was some 36 million tons, while that of Galicia was 1½, and that of Poland 5½ million tons. Other notable mineral industries are those of iron, zinc and lead.

**Manufacture.**—Of industrial workers Upper Silesia possessed the largest number: 47.7% of its population were engaged in industry (1907). In the kingdom of Poland this proportion was only 15.4% (1897), in Galicia 8.8% (1900), Posenania 23.4%, W. Prussia 24.1% (1907). In the kingdom of Poland the most important industry was the textile, which occupied about 150,000 workers. Cotton manufactures were the most important, wool being second. Before the war this industry was handicapped by the high tariff charged by the Russian Government for the transport of raw material. Second in importance was the metallurgical industry, the most important manufactures being machinery, boilers, materials for bridge building, nails, wire and sheet iron. The manufacture of machinery was of considerable importance in Silesia but less developed in Galicia.

Of other industries that of the potato by-products is most important. More than a quarter of the potatoes produced in Posenania and the greater part of those of Galicia were used for the making of alcohol. Before the war the wood industry was in a poor condition owing to severe German importation duties on manufactured wood, but these duties encouraged the development of the saw-mill industry in Prussian Poland. The coastal fisheries of E. and W. Prussia are of considerable importance; likewise the pond fisheries in Poland, but fishing is generally only a subsidiary occupation.

The industry of Poland was very much influenced by the Jewish population. In the kingdom of Poland before the war nearly 15% of the population was Jewish and the following trades were more or less in their control: leather goods and the boot trade; stocking industry; manufacturing of the so-called "astrakan" caps; malt refuse breweries and small mead breweries; manufacture of paper tubes for cigarettes; and potato starch.

**Towns.**—The chief towns in the kingdom of Poland were Warsaw, Lodz and Sosnowice—which had over 100,000 inhabitants. The principal towns of Galicia are Lemberg (206,000), Cracow (154,000), Przemyśl (54,000) and Kolomea (44,000). In 1910 E. Prussia had five towns with a pop. of more than 20,000: Königsberg, Elstert, Memel, Allenstein, Interburg. There were in W. Prussia three towns with upwards of 20,000 inhabitants: Danzig, Thorn and Graudenz. In Posenania there is an unusual number of small towns, but there are only nine with more than 10,000 inhabitants; the most important are Posen (154,811 in 1910), Bromberg (70,000), Schneidemühl (27,504), Lissa (17,156). Silesia has seven towns with a pop. of more than 50,000: Breslau (537,000), Görlitz (86,000), Königs-hütte (72,000), Liegnitz (69,000), Beuthen (67,000), Gleiwitz (64,000) and Zabrze (59,000).

**Communications.**—Of the natural water-ways in Poland the Vistula is the most important. It has 21 tributaries, of which the total length, with that of the river itself, amounts to 7,770 kilometres. In 1864 a convention was made between Russia and Austria for the regulation of the course of the river; in Austria 64.47% of the work was completed by 1909, in Poland 39.7 per cent. Thus in Poland the Vistula is almost impossible for regular steamer traffic.

The Niemen is navigable from about halfway between Grodno and Kovno to the Prussian frontier. The Pilitsa is navigable for rafts from a point near Novo Radomsk to its junction with the Vistula, so for a small portion of the year is the Bug from the point where it first touches Poland and likewise the Narew for a considerable distance. The Oder affords the products of Silesia an outlet not only to Stettin near its mouth, but also to Berlin and Hamburg with which it is connected by an extensive system of water-ways. The Dniester is used in Galicia only for rafting timber. The chief canals are the Dnieper-Bug Canal; the Augustowo Canal, uniting the Vistula to the Niemen through the Narew; and the Bromberg Canal, uniting the Brahe to the Netze and thus the Vistula to the Oder. Of these the latter is the only canal navigable for large boats and steamers. As regards railways, in 1912 the kingdom of Poland had 2.9 km. per sq. km., the Polish provinces of Prussia had 9.27 km. and Galicia (1911) 5.21 kilometres. As the railways were constructed for the most part from a strategical point of view, industry did not benefit so much from them as it might otherwise have done. The poor railway system between Russia and Danzig was one of the causes of the decline of the trade of that port.

*Trade.*—With regard to commerce—the kingdom of Poland was closely attached to Russia by the protectionist system introduced in 1877 and this made trade with other countries difficult. The interchange of goods with Russia was about 2½ times greater than that with other countries. The following were the chief exports: textiles, three-quarters of which went to Russia, though trade with countries further E., notably Persia and Mongolia, was increasing; clothing and boots, which found their chief markets in Russia; horses, poultry and eggs. The chief imports of the kingdom of Poland were:—raw wool and cotton from overseas and from Russian Turkestan; iron ore and pig-iron from Russia; cattle from the steppes; and flour from Russia. In 1909 over 1.4 million q.m. of Russian flour was imported, this forming a formidable competitor to Polish milling thanks to special transport rates.

Galicia was united to the fiscal territory of Austria in 1784 and her commercial interests were generally subordinate to the will of the more powerful states of the west. The principal customer of Galicia was Germany. In 1909 the exports of Galicia to Germany amounted to 10.6 million q.m.; the imports from Germany to 6 million q.m. The chief exports were salt and petroleum and wood. The chief imports were:—textiles to the value of about 300 million francs; iron and iron goods from Germany; coal, of which 7½ million q.m. was imported in 1908.

The industry of the Polish provinces of Prussia began to decline after they were assimilated to the German hinterland. On the other hand, the protective custom tariff acted beneficially on agriculture and the trade in provisions. The principal customers of Posenania were the other states and provinces of Germany. The chief exports were sugar, alcohol and cereals. There were exported annually from 1885–1908 250,000 q.m. of wheat, 2,000,000 q.m. of rye, 410,000 q.m. of barley and 210,000 q.m. of oats. The rye was sent to Bohemia, Austrian Silesia and the kingdom of Poland, rye meal to Scandinavia, Belgium, Holland and Finland. Except for the products of local agriculture and forestry these provinces were entirely dependent on outside sources.

Coöperative credit societies developed vigorously and by 1913 they had together over 75,000 members and deposits of over 202 million francs. The Coöperative Societies' Bank, founded in 1910, formed a financial centre for the societies. With regard to savings banks, by the end of 1912 there were in Galicia 53 banks with deposits amounting to 336 million francs. In Prussian Poland coöperative societies were established on the principles of Schulze-Delitzsch and on the Raiffeisen system—after 1900 buying and selling societies were founded. The Polish credit institutions in Prussia, deriving their capital solely from Polish sources, had at disposal the sum of 498,631,000 francs.

The war left Poland in "a pitiable economic situation." The country was devastated in the first years of the war and then its resources were drained by the German occupation. The mobilization of Polish industry depends on currency stability, improved transport conditions and an abundance of available coal. The following statistics show the number of industrial workers employed before the war and on Jan. 1 1920:—

	Before the war	Jan. 1 1920	Per cent as compared with pre-war figures
Mining . . . . .	28,300	36,900	130
Metallurgical . . . . .	18,650	5,450	29
Metal . . . . .	52,415	7,151	14
Mineral . . . . .	40,900	12,200	30
Textile . . . . .	168,016	38,900	23
Paper . . . . .	7,000	4,000	57
Chemical . . . . .	8,550	3,220	38
Tanning . . . . .	8,020	2,614	32
Provisions . . . . .	33,200	14,370	43
Wood . . . . .	9,540	..	..
Total . . . . .	374,591	124,805	34

It will be seen that the coal industry has, in spite of housing and provisioning difficulties, increased from the pre-war standard. The production of coal in Congress Poland and Galicia does not suffice to cover the requirements of the countries at present constituting the Polish State.—The Reparations Committee assigned to Poland only 250,000 tons of coal per month from Silesia; and the Polish Coal Sub-Committee has granted a lump sum of 450,000 tons of coal. This lack of coal is one of the most serious hindrances to the reorganization of Polish industry.

The oil industry was not much devastated by the war, but for the first five months of 1919 the Boryslaw-Truskawiec basin and that of Bikhov were under Ukrainian administration, and oil had to be used instead of coal for working the shafts. In 1920 about half the textile industry had been mobilized and many factories started in Lodz and also in Czenstochowa, Kalisz and Bielsk. In 1919–20 the output of sugar scarcely amounted to 65% of the expected output, i.e. instead of 500,000 q.m. only 350,000 q.m. were produced. The iron foundries came to a standstill during the war and no plant was left without some essential part wanting. In July 1919 the first blast furnace started work and by the beginning of 1920 a few others were in working order. Steel production is hampered by lack of coal.

*Finance.*—The revenue of the Russian Treasury of the Kingdom of Poland in 1912 amounted to about 609 million francs and the expenditure amounted to about 371 million francs. From 1905 to 1912 inclusive, the excess of receipts over expenditure in the Kingdom amounted to 1,034 million francs. State officials administered the finance of 116 towns in the Kingdom of Poland. The revenue of Warsaw according to the budget of 1914 was 39 million francs. The rural communes possessed a limited autonomy. In Galicia the largest item contributed to the Austrian State was from the taxes on consumable articles and monopolies. The total receipts were 42.37 francs per inhabitant and the expenditure 26.90 francs per inhabitant. As regards the finance of Galicia as an autonomous province, in 1911 the expenditure amounted to 66 million francs, derived mainly from taxes on articles of consumption and provincial surtax on direct contributions. In the 74 autonomous districts the income amounted to 12 million francs, derived from the surtax on direct contributions and the tolls of the districts. The budget of Lemberg was over 11 million francs and that of Cracow nearly 9 million francs. In Prussian Poland the finance of the Empire was based on indirect contributions, customs yielding the largest return. In Prussia direct contributions played the most important part, the income tax producing 9 million francs in Posenania in 1911, and 7 million francs in W. Prussia. The total of the autonomous taxation of the province, districts and communes amounted to 24 francs 35c. per head in Posenania and to 30 francs etc. in W. Prussia.

In the Kingdom of Poland the chief bank was the State Bank. In 1914 there were 38 private branches accredited to it, five branches of Petrograd large banks and five branches of the Riga Bank of Commerce. In Galicia the most important were the Austro-Hungarian Bank, with 13 Galician branches and 20 branches of Vienna and Tebek Banks. Branches of the Reichsbank and of large German Banks protected the German element in Russian Poland. In addition to these there were joint stock banks for credit for short periods. In the Kingdom of Poland there were nine; the deposits amounted to over 296 million francs in 1914. In Galicia the Mortgage Bank was the largest joint stock bank, which in 1912 discounted bills of exchange for 178 million francs. In Prussian Poland the most important was the Bank of the Federation of Coöperative Societies, which had a capital of 29 million francs in 1916. Credit for long periods depended, in the Kingdom of Poland, on the Land Credit Society and the Peasants' Bank; in Galicia, on the Land Credit Society and the Commission of Rentengüter, and in Prussian Poland chiefly on coöperative credit societies.

Finally Poland was in a crippled condition financially. The mark which was at 40 to the pound sterling in 1919, touched a new record on June 28, 1921—namely 6.400 to the pound, and after that fell for two days to 9,000 to the pound. This rate of exchange prevented Poland from trading internationally and consequently hindered her economic reconstruction. On July 30 the Polish budget for 1921, the first real balancing of expenditure and revenue produced by any Polish finance minister, was presented to the Diet and showed a deficit of 80,000,000 marks (the exchange on that day being about 8,000 to the £) for Russian and Austrian Poland without the Polish part of the Austrian duchy of Teschen. The former Prussian provinces which only came under the Ministry of Finance on Sept. 1 1921 have a surplus of 6,000,000,000 marks which reduces its national deficit to 14,000,000,000 marks.

The Ministry of War was responsible for 30% of the expenditure, railways for 21% of the expenditure and food supplies for some 10%. But it may be said that the existing low rate of exchange gave no real indication of the prosperity of the country. Polish indebtedness was not great (about £6,600,000 at the exchange of July 30 1921), the productive capacity of the country was increasing, and the harvest prospects were excellent.

*REFERENCES.*—The one indispensable introduction to things Polish for English readers is the little volume entitled *Poland in the Home University Library* by Prof. Alison Phillips. In that admirable summary there are but two lacunae. The Exodus to Paris after 1830 and the Jewish question are not adequately treated, but it

contains a good bibliography for beginners, to which there are only a few additions to be made:—Geoffrey Drage, "Pre-war Statistics of Poland and Lithuania," published in the *Journal of the Royal Statistical Society* (March 1918); Bruce Boswell, *Poland and the Poles* (1920); Ralph Butler, *The New Eastern Europe* (1919); Erasmus Pilz, *Poland* (1916); Askenazy, *Danzig and Poland*; Bass, *The Peace Tangle* (1921); Mandell House Seymour, *What Really happened at Paris* (1921); Pernot, *L'épreuve de la Pologne*; Report by Sir Stuart Samuel on his Mission to Poland (Cmd. 674), 1920. (G. Dr.)

**POLICE (United States).**—An interesting recent development as regards police in the United States has been the establishment in certain states of a state police, sometimes called constabulary. This body acts under state rather than local authority, is usually organized on a military basis, is widely distributed for patrol duty, but can be quickly mobilized for emergencies. Such forces are of special service for protecting life and property in country districts, made accessible to robbers and assassins by the introduction of the automobile. Since the adoption of national prohibition much of their time has been spent in suppressing illegal liquor traffic.

The largest state police force is that of Pennsylvania, consisting in 1920 of 415 officers and men. It was organized in 1905 somewhat after the model of the Canadian Northwest police. It is composed of five troops with posts in different parts of the state. Detachments are sent out to the 40 stations and from the stations small patrols operate in every direction. The posts and stations are in constant communication, and help can be rushed immediately to any point. They are empowered to make arrests for any violation of the law; at the same time they act as fish and game wardens and as fire patrols. When practicable they cooperate with the local authorities in preserving order. In some states their powers are somewhat restricted; in New York they cannot enter a city to suppress a riot unless so ordered by the governor or on request of the mayor with the approval of the governor. But in any state they may pursue a criminal and arrest him anywhere. In Pennsylvania applicants for appointment who have served in the army, navy or militia are given preference. The recruit serves a probation period of four months and makes a study of the state laws. The period of enlistment is two years. Another type of state police is seen in South Dakota, where the sheriffs and deputy-sheriffs form a state constabulary "for the purpose of detecting crime, apprehending criminals, suppressing riots, preventing affrays, and preserving and enforcing law and order throughout the state." In Idaho all state, county and municipal officers form a state constabulary under the direct control of the commissioner of the department of law enforcement. A third type is seen in the Massachusetts District Police, consisting of a detective and an inspection department. Appointments are made by the governor and his council. At the governor's command they suppress disorder anywhere in the state. They do not maintain a patrol. In 1920 a state police, or constabulary, was maintained in 12 states: Massachusetts, Texas, Connecticut, Pennsylvania, Nevada, New York, South Dakota, Michigan, Idaho, New Mexico, Tennessee, and West Virginia. At that time several other states were considering the establishment of such forces.

A special committee on state and metropolitan police, appointed by the American Institute of Criminal Law and Criminology, in a report submitted in 1920 urged active cooperation "in educating the people, and especially the Legislatures of their respective states, with respect to the nature, methods, and value of a state police force."

See this committee's report, "Metropolitan and State Police," in the *Journal of the American Institute of Criminal Law and Criminology*, vol. xi., No. 3 (Nov. 1920). An excellent account of the largest and best organized of the state police forces is given by Katherine Mayo in *Justice to All: The Story of the Pennsylvania State Police* (1917), with an introduction by Theodore Roosevelt.

**POLLIO, ALBERTO** (1852–1914), Italian general, was born at Caserta on April 21 1852. Before he was nine years old he entered the Naples military college, and he received his commission as a sub-lieutenant of artillery in April 1870. He served with distinction in various posts, and in June 1908 he was appointed chief of the Italian general staff, a position which he retained till his sudden death on July 1 1914. Pollio

acquired a wide reputation as a writer on military subjects, his chief works being on Waterloo and Custoza. Both these books were translated into various languages.

**POOR LAW**, in the United Kingdom (see 22.74).—During the decade following the publication of the Royal Commission's Reports in 1909 the English Poor Law system underwent some minor administrative reforms. The commissioners had laid bare many crying scandals, and their reasoned indictment of the whole system aroused immediate and wide-spread interest. An agitation was set on foot, and actively prosecuted for several years by the partisans of the Minority Report, who demanded the complete abolition of the Poor Law. Many M.P.'s, irrespective of party, were pledged to this, and the public generally was prepared for drastic legislation. It was expected that the Government would presently take the matter up, when the outbreak of the World War in 1914 shelved the question. Meanwhile the Reports and the agitation begun in 1910 could not be entirely ignored by the Poor Law authorities themselves. Mr. John Burns, the President of the Local Government Board, though a staunch defender of the Poor Law, was bound to admit that some amendments were necessary. But these, he claimed, could be carried out by his own department. What was wanted was not, as he put it, "reform by revolution, but revolution by reform in administration." The administrative revolution, however, did not produce any startling changes. A new Relief Regulation Order was issued, which did a little to improve the administration of outdoor relief, but left the fundamental objections untouched. Another Order (Poor Law Institutions Order 1913) was designed to consolidate the regulations governing indoor relief. This, too, effected slight improvements in classification, the quality of the nursing service, the paupers' dietaries and so on. It also insisted on the removal of children over three years of age from the general mixed workhouse into separate institutions or quarters. But many of the boards of guardians were apathetic, or openly defiant of the central authority, and a steady pressure was required to reduce the numbers of these children, whose condition had been shown by the Royal Commission in 1909 to be peculiarly scandalous. During the war this pressure was relaxed, and in 1921 there was still a residue of children between 3 and 16 years of age (besides the infants under 3) living in the general workhouse wards. In 1911 a Boarding-out Order emphasized the need of closer supervision and more adequate allowances for the pauper children lodged in private houses with "foster-parents." There was also an attempt made to deal with the problem of vagrancy in London, by putting all the casual wards of the Metropolis under the control of the Metropolitan Asylums Board, cooperating with the police and various philanthropic agencies. And rather late in the rest of the country most of the boards of guardians combined in county vagrancy committees, for the better co-ordination of their treatment of the tramps. "Way-tickets" and bread-stations were established, a number of casual wards were closed, and expenses were pooled. But these reforms scarcely amounted to a revolution, either in their conception or in their effects.

Of the later developments only two are of any importance. The Representation of the People Act 1917 removed the disfranchisement which had been one of the chief stigmata of pauperism. Hitherto the receipt of parish relief (other than medical relief only) "within the twelve months next preceding the last day of July in each year" had disqualified a man or woman from being registered as a voter. Now anyone may vote, provided he is not actually an inmate of a Poor Law institution at the moment of the election. In 1919 the Local Government Board ceased to exist, and was succeeded as the central Poor Law authority by the newly created Ministry of Health. This change made no outward difference, but it was generally taken to foreshadow a thorough reform of the Poor Law system, and the Ministry of Health Act 1919, sect. 3 (3), actually contains the significant words: "in the event of provision being made by Act of Parliament . . . for the revision of the law relating to the relief of the poor and the distribution amongst

other authorities of the powers exercisable by boards of guardians." The removal of the pauper disfranchisement was in harmony with the growing democratic spirit of the time, and reveals clearly the enormous change in thought since the setting-up of the "New Poor Law" in 1834. The same softening tendency appears also in the trivial, but significant, alteration of the name of the workhouse: the workhouse is now officially known as "the institution," though the word "workhouse" must be retained for certain legal purposes.

Meantime, a different sort of reform was proceeding from outside the Poor Law, by the increasing inroads of the local authorities into the field of the guardians. On the removal of the "pauper disqualification" in 1911 many thousands of the destitute aged became entitled to old-age pensions and so passed out of the Poor Law. Similarly the National Health Insurance Act took a vast number of patients, or potential patients, from the Poor Law medical service. And later Acts, empowering the local health authorities to set up maternity and infant clinics, to provide midwifery, to supply milk to expectant and nursing mothers, to treat venereal disease or tuberculosis, have still further diminished the scope of the Poor Law. All this, however, desirable as it might be from the point of view of social progress, could hardly be regarded as "Poor Law reform" save in an ironical sense. In point of fact, it served to reinforce more and more strongly one of the principal charges made by the Royal Commission in 1909. For it meant in practically every department an increase of administrative disorder—overlapping, multiplication of machinery and waste. In the case of every class of the pauper host, infants, children of school age, the sick, the feeble-minded, the aged, the able-bodied, there is now at least one, and generally more than one, other authority set up as a rival to the board of guardians. There is little, if any, co-ordination between the work of the medley of public bodies engaged in giving various forms of assistance out of the rates and taxes. They are in many cases dealing on different lines, and for different reasons, with different members of the same family. So far as the Poor Law Guardians are concerned, it is often a mere matter of chance whether it is they or the local health or lunacy or education authority who become responsible for a sick or feeble-minded person or a school-child. And as regards the aged, it was found that at the beginning of 1920, out of a total of 46,846 paupers over 70 in England and Wales, no less than 9,345 were old-age pensioners, two-thirds of them receiving outdoor relief and the other third in institutions.

When, in the latter period of the World War, public attention was directed to the problems of social reform that would have to be solved after the peace, this question of "public assistance" inevitably bulked large. In July 1917 the Ministry of Reconstruction appointed a "Local Government Committee" to consider and report upon "the steps to be taken to secure the better co-ordination of public assistance in England and Wales and upon such other matters affecting the system of Local Government as may from time to time be referred to it." Its report—popularly known as the Maclean Report, from the name of the chairman, Sir Donald Maclean; M.P.—was presented at the end of 1917. Subject to reservations by certain members of the committee, it was unanimous on the main point. The existence side by side, it declared, of the boards of guardians on the one hand, and the county, municipal and other health and education authorities on the other, produced both overlapping functions and areas and conflicting principles of administration.

"The resulting confusion has been aggravated by the growing popular prejudice against the Poor Law—a prejudice which does less than justice to the devoted work of the Guardians, and the continuous improvement in poor-law administration, especially in respect of the children and the sick. For the last decade Parliament has been unwilling to entrust the Boards of Guardians with new functions, and the provision for new services has had to be made by other Local Authorities—in some cases new Local Authorities—often to the increase of the confusion and overlapping. Further, the classification by institutions and the specialized treatment of recipients of assistance almost necessarily involve an enlargement of existing areas of administration."

The committee, therefore, recommended the abolition of the boards of guardians and the Poor Law unions. The scheme advocated may be summarized as follows:—

1. All the functions of the boards of guardians should be transferred to the councils of counties, county boroughs and boroughs or urban districts with populations exceeding 50,000.
2. Provision for all the sick and infirm (including the aged requiring institutional care, and maternity and infancy) should be made by these authorities under the Public Health Acts suitably extended.
3. The Ministry of Health should have power to put any borough with a population over 10,000 or any urban district with over 20,000, in the position of an autonomous health authority, with such reservations as might be desirable.
4. The children should be dealt with by the local education authorities, the mentally deficient by the local lunacy authorities.
5. Every county or county borough (or borough or urban district council with a population over 50,000) should set up: (i.) a prevention of unemployment and training committee (on the lines of the education committee, and including representatives of employers and trade unions); (ii.) a home assistance committee (on the lines of the education committee) to enquire into the economic circumstances of all applicants for public assistance, to supervise them, to administer all relief given in the home, to recover expenses of maintenance, treatment, etc., and to keep a private register of all such applicants and their families and of the assistance given.
6. County councils should appoint committees for districts or combinations of districts, to which various functions of the home assistance committee and the prevention of unemployment committee would be delegated. Such district committees would consist of: (a) members of the county council; (b) borough or district councillors; (c) persons experienced in the work to be done.
7. London should have a special scheme, in which the functions would be divided between the London County Council and the metropolitan borough councils. The borough councils would appoint home assistance committees, and would also be responsible for vaccination and registration of births and deaths. The London County Council would, through its appropriate committees, exercise the rest of the functions transferred. It would also appoint a central assistance committee, which would lay down a policy and rules of local administration for the home assistance committees in the metropolitan boroughs.
8. Poor Law officials should be transferred to the local authorities (provided both they and the local authorities agreed), and compensated for any pecuniary loss incurred by the change.
9. The cost of all functions transferred should fall on the new authority (the county, county borough, borough or urban district, and in London mainly on the county, but partly on the metropolitan borough).

Scotland, of course, was outside the committee's reference. But if their proposals were adopted, a Scottish scheme on similar lines would undoubtedly follow.

These recommendations were an endorsement of the principles advocated by the Royal Commission in 1909. The Maclean Report was, indeed, a compromise between the majority and minority of the Royal Commission, though leaning more heavily to the side of the minority, who, unlike the majority, had insisted above all on the abolition of the *ad-hoc* destitution authority. And the importance of the new recommendations was enhanced by the fact that they marked the actual reconciliation of the two parties, since Lord George Hamilton and Sir Samuel Provis, who had signed the Majority Report in 1909, and Mrs. Sidney Webb, who had signed the Minority Report, were unanimous on the Maclean Committee. The Government eventually pledged itself to legislate on the lines of the Maclean recommendations at the first opportunity. But no opportunity had been found by the session of 1921.

The Poor Law system, therefore, then remained still in theory as it was in 1834, when the famous "principles" were established—first, that relief should not be offered to able-bodied persons and their dependents except in a well-regulated workhouse; and, secondly, that the lot of the able-bodied should be made "less eligible" than that of the independent labourer of the lowest class. These principles had already worn very thin by the beginning of the 20th century, and the Royal Commission in its investigations from 1905 to 1909 discovered a wide-spread laxity. Nevertheless, whether the administration was, or is, lax or strict, its character is inevitably fixed by the fact that the Poor Law deals with the destitute. It is true that the guardians are entitled to interpret "destitution" fairly broadly—to treat it, in fact, as meaning "necessitous"; but in practice this amounts to little. Generally speaking, relief is only given to those who are in a grave state of want. This fact, with its natural consequences, especially in the domain of public health, has

been increasingly emphasized in recent years. And there is no doubt that it has been one of the chief reasons why public opinion has favoured the sapping of the Poor Law by the local authorities, who are under no such restriction and are better able to apply preventive rather than palliative treatment. But the large increase of public assistance by these other bodies, while adding to the administrative confusion, still leaves a huge volume of pauperism and a huge expenditure by the Poor Law guardians.

The following figures show the total number of persons in England and Wales in receipt of Poor Law relief of all kinds on Jan. 1 of each year:—

1900	803,247	1917	637,327
1905	924,630	1918	586,785
1910	935,738	1919	551,617
1914	761,578	1920	575,418
1915	762,060	1921	663,667
1916	684,549	—	—

None of these figures of course represents the complete total of pauperism in any one year, for they only relate to one day, and allowance must be made for many other individuals—amounting to several hundreds of thousands—who will receive relief at one time or another during the twelve months. The figures do, however, afford an accurate basis for tracing the movements of pauperism. It will be seen that between 1910 and 1914 there is a large decline. This is mainly due to the causes noted above—the removal of a great number of the aged and of the sick from the Poor Law. On the declaration of war in Aug. 1914 there was a sharp rise in pauperism, owing to the rapid and widespread dislocation of industry. Within three weeks of the outbreak of hostilities the total of persons in receipt of relief was over 40,000 higher than that for the corresponding date in 1913, and a month later it had risen by another 115,000. Very soon, however, there began an equally rapid recovery, and with the absorption of men into the army or munition work and the influx of women into industry, pauperism declined month by month. Many of the workhouses and infirmaries were taken over by the War Office for military use, their inmates being moved to other buildings or boarded out in neighbouring unions. The volume of pauperism continued to fall progressively till the end of the war, under the influence of such causes as enlistment, the unsatisfied demand for labour of all sorts, both of men and women, the generally high rates of wages, and the steady income drawn from separation allowances and pensions by poor people whose earnings had previously been precarious or inadequate. Nevertheless, there was a permanent residue of sick and infirm, feeble-minded, aged and children. After the Armistice in Nov. 1918 the figures began to mount again. Demobilization brought in its train a renewal of unemployment, together with industrial disputes and reduced earnings. Throughout 1919 and 1920 the rise continued until, at the beginning of 1921, when the whole country was involved in a serious trade depression, the total was approaching the pre-war level.

The movement of Poor Law expenditure during the first twenty years of the 20th century shows little fluctuation; it increased continuously, as the following figures indicate:

*Total Expenditure on all Poor Law Services in England and Wales.*

1900	£11,567,649	1917	£16,187,748
1905	13,851,981	1918	17,039,623
1910	14,849,584	1919	18,423,883
1915	15,804,073	1920	23,501,241
1916	16,085,586	—	—

The reason for the paradoxical increase of expenditure on a decreasing number of persons during the war is, of course, to be found in the rising cost of maintenance, including food, fuel, medicine, salaries and so on. The average cost of maintaining a pauper in the general workhouse before the war was 73s. 3d. per week in London and 10s. 10d. elsewhere (1910). In 1918 it was 18s. 5d. in London and 20s. 3d. elsewhere, whilst the weekly cost of maintenance in the infirmary was 37s. 6d. in London and 30s. 4d. elsewhere. In 1919-20 the cost had mounted to 24s. 5d. in London and 25s. 6d. elsewhere for maintenance in the workhouse, and to 46s. 7d. in London and 40s. 3d. elsewhere for maintenance in the infirmary. In Scotland the figures, both of persons relieved and of expenditure, pursue much the same course, though they are naturally much smaller since the population of Scotland is less than one-seventh of that of England and Wales. In May 1920 the total number of legal poor of all classes in Scotland was 87,868. The majority were on outdoor relief. 16,175 were insane, maintained in asylums, lunatic wards or private dwellings. Of the sane, between 8,000 and 9,000 (including nearly 800 children) were in the poorhouses. The Scottish Poor Law expenditure for 1918-9 amounted to £1,667,536 and for 1919-20 to £2,093,523. The weekly cost of maintenance in the poorhouse in 1920 averaged about 23s per head. (C. M. L.)

**POPPER, DAVID** (1846-1913), Bohemian violoncellist (see 22.91), died in 1913.

**PORTER, BENJAMIN CURTIS** (1843-1908), American painter (see 22.113), died in New York City April 2 1908.

**PORTER, HORACE** (1837-1921), American diplomatist and soldier (see 22.116), died in New York City May 29 1921.

**PORTO RICO** (see 22.124).—Important developments in the affairs of Porto Rico—political, economic, social—took place in the decade 1910-20. Politically, the organic law was first amended and later materially changed. Economically, the agriculture and commerce of the island underwent notable increase. Socially, there was progress in the betterment of living conditions, in the spread of elementary education and in the reduction of poverty and disease. The Act of Congress approved April 12 1900 (the Foraker Act), under which the island had been administered for the first decade of its existence under the American flag, was amended by the Act of Congress approved July 15 1909 (the Olmsted Act). In so far as supervised by the United States, Porto Rican affairs were placed under the jurisdiction of an executive department to be designated by the president, the War Department being subsequently designated. To prevent recurrent deadlocks over the insular budget, provision was made that if the legislature failed to pass the appropriation bill for an ensuing fiscal year, the sums authorized for the current year should be deemed to have been appropriated and might be lawfully expended. Far more thorough-going were the changes effected by the passage of the Act of Congress approved March 2 1917 (the Jones Act). By its provisions citizens of Porto Rico are deemed and held to be citizens of the United States.

Six executive departments are constituted: justice, finance, interior, education, agriculture and labor, and health. The governor, the attorney-general and the commissioner of education are appointed by the President of the United States, subject to the approval of the U.S. Senate; the heads of the remaining departments by the governor of Porto Rico subject to the approval of the insular Senate. The law-making power is vested in a legislature consisting of a senate of 19 members and a house of representatives of 39 members, all elected by manhood suffrage for a term of four years. Acts of the legislature may be vetoed by the governor; but his veto may be overridden by a two-thirds vote. The President of the United States may nevertheless interpose a final veto. Matters relating to franchises and concessions are vested in a public service commission consisting of the heads of the executive departments, the auditor, and two elected commissioners. A resident commissioner to the United States, paid by the Federal Government, is elected by popular vote for a term of four years; he represents the island in the House of Representatives, with voice but without vote, and is recognized by all departments in Washington.

The economic experience of the years 1910-20 was the increased and more profitable production of sugar, tobacco, coffee and fruits, consequent in the first instance upon duty-free access to the American market, and aided by the completion of insular projects of irrigation. The increase of exports was accompanied by larger imports, by a reversal of the island's adverse trade balance, and by an appreciable though unequal diffusion of gain among the island's population, the growers of sugar and tobacco being specially benefited. The commerce of the island trebled in the decade, the combined value of imports and exports rising from \$78,705,364 in 1911, to \$247,199,983 in 1920. This amazing growth was uneven. The activity of 1911-2 was followed by reaction in 1913, accentuated by the dislocations consequent upon the outbreak of the World War. War demand for the island's staples made itself sharply felt in 1916-7 with some arrest in 1918-9. In 1920 came sensational developments, exports rising from \$79,496,040 in the preceding year to \$150,811,449, and imports from \$62,400,360 to \$96,388,534. The factors directly responsible were the world's runaway markets in sugar and to a less absolute degree in tobacco and coffee. Sugar exports in tonnage were actually less in 1920 than in 1916 and 1917; the price per ton rising from \$75.81 in 1911, to \$136.77 in 1919, and to \$235.88 in 1920.

The visible trade balance in favour of the island rose from a previous maximum of \$27,780,417 (1916) to \$54,422,915 in 1920. The great bulk of this trade, 90% in 1920, was with the United States.

There was marked improvement during the decade in the island's material equipment. New schoolhouses were erected, and additional roads and bridges constructed. Even the remotest towns of the interior had in 1920 waterworks and electric-lighting plants, made possible through loans from the insular treasury. The increase in private wealth was reflected in the erection of many attractive residences, while the development of commerce and agriculture stimulated the extension of bank and transportation facilities. The basis of the insular revenue system remained the measure put into

operation with the establishment of civil government under the American flag (the Holland law), as modified and adapted to meet changing conditions. Ordinary expenditures for the fiscal year 1920 were \$7,258,970.57, as compared with \$3,685,613 in 1911. The total assessed valuation of all property for purposes of taxation in 1920 was \$264,235,686, as compared with \$133,817,931 in 1911.

The pop. of the island in 1920, despite appreciable emigration to the United States and Santo Domingo, was 1,299,809 (an increase of 181,797 in the decade), with a density distribution of 378.4 per square mile. In consequence of this continued growth, education and health remain grave problems. The total enrolment in all schools supported by public funds was 184,991. Of the 228,829 children of compulsory school age (8-14 years) only 61% attended school. The death-rate for 1920 was 23.33 per 1,000 inhabitants as compared with 24.97 in 1911. But in 1920, tuberculosis, malaria and uncinariasis (hookworm), together with infant mortality, still accounted for 60% of the total death-rate. The enquiries of a commission sent by the Rockefeller Foundation upon the request of the insular authorities confirmed the opinion that about 90% of the people of the island were infected with uncinariasis. "Our population is one of the densest on earth," the insular commissioner of health, himself a distinguished Porto Rican, wrote in 1920. "More than 70% are in the country, badly housed and fed, ill in health and ignorant of the first principles of hygiene. Until the people have learned to preserve and protect their health and have more ample means to provide better houses and food so as to reduce their miseries, no positive result, no recompense for all our efforts, can be obtained."

The governors were George R. Colton, 1909-13; Arthur Yager, 1913-21; E. M. Reily, 1921- . (J. H. Ho.)

**PORTUGAL** (*see* 22.134).—The effects of the Portuguese Revolution of Oct. 1910 fell most heavily on the poor of the country districts, who suffered from the loss of charities sustained by the expelled religious bodies and of the care of the sisters of charity, and from the exile of many of the richest families and the transference of capital abroad. In consequence, emigration in the years preceding the World War increased to an unprecedented extent, rising from 6-83 per 1,000 in 1910 to 14-85 per 1,000 in 1912. In one district, that of Braganza (Bragança), it rose to 6% of the population. In the towns unrest was less passive and discontent with the working of the Republic was prevalent; lavish promises had aroused impossible hopes among the people, and by many the Republic was regarded as but a first step towards a more Radical workmen's republic. Socialism and syndicalism developed rapidly. The right to strike at 24 hours' notice, conceded on Dec. 7 1910, was followed by strikes of all kinds, including several serious railway strikes. The disorders culminated in the demonstration against Parliament on Aug. 2 1911 and the general strike at Lisbon on Jan. 31 1912, when the city was placed under martial law and over 1,000 workmen suspected of syndicalism were arrested. The new governing class, largely composed of professional men, chiefly lawyers and journalists, had not the necessary authority to prevent excesses.

The Provisional Government of the Republic consisted of Dr. Theophilo Braga, President, Dr. Antonio José de Almeida (Home Affairs), Dr. Afonso Costa (Justice), Col. Corrêa Barreto (War), Dr. Amaro Azevedo Gomes (Marine), Dr. Bernardino Machado (Foreign Affairs), Dr. Basilio Telles and, later, Dr. José Relvas (Finance), Dr. Antonio Luiz Gomes and, later, Dr. Brito Camacho (Public Works). It lasted till Aug. 24 1911.

*The Constitution*.—On March 18 1911 the new electoral law came into force. It gave the vote to all Portuguese over 21 years of age who could read or write, including priests and officers of the army or navy, but excluding naturalized Portuguese, officers on the active list and persons proscribed politically. Lisbon and Oporto (voting on the proportional system) were to return ten deputies each, the other districts four and the colonies one each. By a modification of Jan. 11 1915 Lisbon received 20 deputies, Oporto 10, the remaining constituencies between 1 and 4 each. By a decree of March 11 1918 universal suffrage for all citizens over 21 was established, but illiterates (75% of the pop.) were again disfranchised in 1919. By the law of 1918 the number of deputies was reduced to 155, returned by 51 constituencies, of which Lisbon returned 14, Oporto 6. The representation in the Senate, consisting of 77 members, was made regional and professional. By a decree of April 26 1918 soldiers and sailors on active service were allowed to vote. In the elections held on May 28 1911 many of the candidates were nominated by the authorities

without opposition and, even where there was an election (in 28 out of 50 districts), the Government candidates were returned without difficulty, no Royalists offering themselves.

The Constitutional Assembly was opened on June 19 1911 and a decree was passed declaring the monarchy abolished and the House of Braganza forever banished from Portugal. On Aug. 20 the new constitution was voted. It provided for two Chambers, that of the Deputies, consisting of 163 members to be elected every three years, and the Senate, consisting of 71 members. The President of the Republic was to be elected by both chambers for four years and could not be reelected. His salary was fixed at £3,600, with £1,200 for expenses. On Feb. 19 1920 he was given the right to dissolve parliament, after consulting a special council appointed for this purpose.

The first President under the new constitution was Dr. Manuel de Arriaga (born in 1840, at Horta, in the Azores), who, on Aug. 24 defeated the Radical candidate, Dr. Bernardino Machado, by 121 votes to 86, the Conservative candidate, Senhor Braamcamp Freire, having withdrawn. The members of the first Constitutional Ministry were: Dr. João Chagas, premier and minister of Home Affairs; Dr. Augusto de Vasconcellos (Foreign Affairs); Dr. Duarte Leite (Finance); Gen. Pimenta de Castro (War); Senhor João de Meneses (Marine); Dr. Celestino de Almeida (Colonies); Dr. Diogo Tavares de Mello (Justice); Dr. Sidonio Paes (Public Works). The Government was opposed by the Radicals under Dr. Afonso Costa and faintly supported by the other groups—the Evolutionist followers of Dr. Almeida, the Unionist followers of Dr. Brito Camacho and the Independents: One of the first measures was to vote the payment to each deputy of 175. for each sitting of the assembly.

*Church and State*.—The anti-clerical policy of the Provisional Government had entailed serious difficulties. The bishops signed a pastoral letter of protest and on March 8 1911 the bishop of Oporto was removed from his see, with a pension of £240. The religious orders had been expelled by the decree of Oct. 8 1910, their property confiscated and the convents closed. By that of Oct. 22 the teaching of religion in the primary schools was forbidden. Marriage of priests became legal. The decree of separation between Church and State was drawn up, under the date of April 20 1911, by Dr. Afonso Costa, then Minister of Justice. It granted full liberty of conscience to all Portuguese citizens. The Roman Catholic religion ceased to be that of the State, which recognized all creeds as of equal authority, making no payment for their support. Among other proscriptions, public worship was to be open to the public and was held to include religious instruction, public or private. The congregation might only contribute to the expenses of their worship through the *miseri-cordias* or other Portuguese charitable institutions. The churches were declared inalienable without the consent of the Minister of Justice and might be expropriated at any time. Local authorities were given full power to restrict or forbid processions, funerals or other external acts of worship. An inventory was to be taken (June-Sept. 1911) of all Church property, including churches and cathedrals, which became the property of the State. The clergy were granted a salary under certain conditions and all ecclesiastical property was made liable to taxation. The priests were forbidden to wear the cassock except at services. No foreigner or naturalized Portuguese might take part in any service except in the case of international agreement or ancient custom. Papal edicts might not be promulgated in Portugal without the consent of the Government.

This decree, in a country where over 90% of the inhabitants were Roman Catholic, was considered to be the subjection of the Church to the State rather than its separation, and contributed towards alienating the north of Portugal from the Republic. The patriarch of Lisbon and the bishop of Guarda published a pastoral letter forbidding the clergy to accept salaries from the State. For consistent opposition to the law of separation the bishop of Guarda and the patriarch of Lisbon were banished from their dioceses for two years.

The value of the Church property confiscated was £6,000,000. Owing to official protests on behalf of some of the foreign congre-

gations a promise was made to revise the law of separation, a promise only partially redeemed in 1918. Claims for compensation were referred to the Hague Tribunal by an agreement signed July 31 1913 by Great Britain, France and Spain, the only countries which accepted arbitration. The claims, including those of Italy, Belgium and Germany, amounted to £2,000,000. By the award given Sept. 5 1920 Portugal was condemned to pay £21,800 to Great Britain and £80,000 to France.

After the promulgation of the law of separation, and the Pope's encyclical of May 23 1911, *Jamdudum in Lusitaniâ*, relations between Portugal and the Vatican were broken off, and the Portuguese Legation at the Vatican was suppressed July 10 1913. The law was extended in Nov. 1913 to the Portuguese colonies, where the discouragement of Portuguese missions later gave rise to serious fears of the denationalization of the colonies through the activity of foreign missionaries. When Paes subsequently became president, one of his first acts was to redress some of the grievances suffered under the law of separation, and, by a decree of Dec. 22 1917, banishment imposed on the priests was annulled and the Cardinal Patriarch returned to Lisbon. In May 1918 conversations between the Papal Nuncio and the Portuguese Minister at Madrid resulted in a visit of the former to Portugal and he was received by President Paes, who informed him of the intention of the Government to send a Portuguese representative to the Vatican. Monsignor Locatelli was appointed Papal Nuncio in Portugal in April 1919. Relations with the Vatican were maintained after President Paes' death, and in 1919, and again in 1920, the Pope wrote Cardinal Mendes Bello and the Portuguese prelates congratulating them on the improved religious conditions.

*The Royalist Invasions.*—The main event of Senhor Chagas' premiership was the first Royalist invasion, commanded by Capt. Henrique Mitchell Paiva Couceiro. Small Royalist risings had been suppressed during the summer of 1911, but Capt. Couceiro still threatened the northern frontier. Representations were made by the Republic to the Spanish Government, which was itself suffering from the action of Portuguese Republicans in Spain. The Spanish authorities seized 4 Krupp guns and 1,000 rifles at Orense, and the German steamer "Gemma," with rifles and ammunition, was detained at Corubiôn. The steamers, "Foam Queen" and "Arizona," with war material, ostensibly bound for Bahia Blanca, were detained by the customs authorities of London and Barrow in August. Couceiro crossed the frontier on Oct. 3 at the head of about 1,000 men, not a quarter of whom were armed with rifles. He advanced in the direction of Braganza and took the small town of Vinhaes, but evacuated it on Oct. 6 and, after maintaining himself for a fortnight in the hills, recrossed the frontier. A Royalist rising in Oporto, timed to coincide with this invasion, was brought prematurely to a head by Carbonario agents on Sept. 29, and this prevented the north from rising, except in the case of a few isolated villages.

King Manoel and the Pretender Dom Miguel met at Dover on Feb. 6 1912 to concert on common action, and the Royalist cause was strengthened by the great wealth of the Miguelists. On July 7 Couceiro again crossed the frontier, with a slightly larger force, but most of his arms and ammunition had been seized in Belgium and Galicia. The Royalist attacks on Valença and Chaves failed, and within a week they returned to Spain. Royalist risings in the northern provinces were speedily suppressed, and great excitement prevailed in the south, where the Carbonarios discovered a Royalist plot at Torres Vedras. D. João de Almeida and other prisoners-of-war were tried by court-martial and confined in the Lisbon Penitenciaría.

*The Political Trials.*—The arrests after the invasions of 1911 and 1912 were very numerous. Special tribunals were set up in Lisbon and Oporto in Jan. 1911 to try cases of political conspiracy, and in July 1912 Parliament voted still more stringent laws of defence. All persons suspected of reactionary opinions, religious or political, were in danger. Thousands of innocent persons were summarily arrested without the formulation of any definite charge and were confined for months in subterranean dungeons.

The chief instrument of this widespread system of espionage and terrorism was the organization of the Carbonarios. This

secret society, the *Jov. Port.* (Young Portugal), founded or revived by Senhor Arthur Duarte da Luz e Almeida, forced through the Revolution of 1910 before the politicians were prepared for it. It assumed the functions of an unofficial police force and at times proved itself strong enough to attack the Republican Government and the army. Its members, who carried arms, were Republicans of the most extreme type; many had also joined its ranks in order to gratify some personal dislike or to secure the rewards given to successful informers. It was thus a body composed of dangerous fanatics. Completely blind to the political embarrassments which its actions might bring upon the Republic, it arrogated to itself the right of summary arrest. Senhor Chagas estimated that on Oct. 23 1911 there were 2,000 political prisoners awaiting trial, of whom 700 were innocent.

So notorious was the barbarity with which suspects were treated that a committee of prominent British residents was formed to investigate and, if possible, alleviate their condition. Several Portuguese Republican newspapers and prominent Conservative Republicans corroborated the findings of the British committee and diplomatic representations followed. But reforms were opposed by the Carbonarios and the Radical Republicans, and some of the worst outrages were committed under the weak Government which succeeded that of Senhor Chagas in Nov. 1911, with Dr. Augusto de Vasconcellos as premier, and under the third Coalition ministry formed by Dr. Duarte Leite in July 1912. One of the worst features was the intimidation of justice, the law courts being frequently filled with Carbonarios.

Hopes of improvement vanished when the Government resigned in Dec. 1912, and, after various attempts on the part of President Arriaga to form a moderate ministry, Dr. Afonso Costa, the Radical leader, came into power in Jan. 1913. In March of that year Adelino, Duchess of Bedford, with expert knowledge of prisons, visited the prisons of Lisbon, and meetings of protest against the treatment of the prisoners, held in London, advocated a general amnesty. Under the pressure of public opinion, the Minister of Justice in Jan. 1913 introduced a bill modifying the Penitenciaría régime, and in Feb. of that year 600 political prisoners and common criminals were excused from wearing the convict's hood, a pardon was granted to 300 prisoners, but the general amnesty was delayed till Feb. 1914.

The situation had become one of growing unrest and strikes were frequent. In April 1913 an attempted ultra-Radical *coup d'état*, in which a portion of the army and navy were implicated, was quelled and part of the crews of the "Vasco da Gama" and "S. Gabriel" were transported to Angra in the Azores. In June the Government decreed the suppression of the Lisbon Syndicalist Club. In July a movement similar to that of April was marked at Lisbon by attacks on the military barracks and was followed by numerous arrests. In Oct. 130 Republican prisoners were transferred to the fortress of Elvas, and a Monarchist movement at Lisbon and Oporto led to redoubled Carbonario activity. The amnesty bill became law on Feb. 22 1914 and in all about 1,300 prisoners (of whom over one-third had not been tried) and 1,500 exiles benefited by it, excluding Paiva Couceira among others. The courts martial, which had been active during two years, were abolished by a decree of Aug. 19.

Dr. Afonso Costa, who gave much of his attention to finance, resigned on Feb. 9 1914, and Dr. Bernardino Machado became premier and was in office when the World War began.

On Dec. 13 1914 Dr. Machado was succeeded in the premiership by the Democrat, Senhor Victor Hugo de Azevedo Coutinho, President of the Chamber of Deputies, with a view to holding the elections which were fixed for March 7, but the Government's purpose was prevented by a military movement, and President Arriaga appealed to Gen. Pimenta de Castro to constitute a government representative of a wider body of opinion in the country; he formed a ministry on Jan. 28, 1915. The action of the new Government was conciliatory and had the support of the moderate Republicans led by Dr. Antonio José de Almeida; the country's foreign policy remained unchanged, but the activity of the Carbonarios was checked, the so-called Committee of Public Safety abolished and the refractory municipal councils dissolved.

The general election was now fixed for June 6 1915. In April an amnesty emptied the prisons. The Democrats were, however, able to count on the support of the marines and on May 14 the sailors mutinied, shot the captains of the "Almirante Reis" and "Vasco da Gama" and bombarded Lisbon, about 100 persons being killed. Pimenta de Castro resigned on May 15, and was arrested next day and transported to the Azores. The revolutionary committee nominated Senhor Chagas as premier, but on May 16 he was shot at and wounded in the train, on his way to Lisbon by Senator João de Freitas, who was killed. Chagas resigned on May 24 and was succeeded by Dr. José de Castro.

In a message addressed to Parliament Arriaga resigned the presidency as from May 29 (he died on March 5 1917); and after a short interim presidency under Dr. Theophilo Braga, he was definitely succeeded as President on Aug. 6 1915 by Dr. Bernardino Machado. The Government resigned in June, Castro again becoming premier, but he resigned in Nov. and Dr. Costa returned to office.

*The Revolution of Dec. 1917.*—On Dec. 5 1917 a revolution directed against the internal policy of Costa and the Democrats broke out at Lisbon. The rebels entrenched themselves in the Parque Eduardo VII. and their artillery opened fire upon the fleet. After two days' fighting, Gen. Norton de Mattos and Capt. Leotte do Rego took refuge on board a British ship in the Tagus. Dr. Costa and Dr. Soares were arrested; President Machado was placed under arrest, and on the 15th was conducted to the frontier. Vice-Adml. Machado dos Santos was released from prison and, with Maj. Sidonio Paes, the leader of the movement, and Capt. Feliciano Costa, formed a revolutionary committee. A provisional government was now constituted, Maj. Paes becoming President and Minister for War and Foreign Affairs. The Radical sailors mutinied on Jan. 8 1918 and bombarded Lisbon, but the movement was easily quelled, and several hundreds were deported to Africa. On Jan. 12 Paes left for the north, and at Oporto was received enthusiastically, as also on his return to Lisbon. A visit to the south in Feb. was equally successful.

In March 1918 Paes reconstructed his ministry, and the elections, on an enlarged franchise, were held throughout the country on April 28. The election of the President was held by universal suffrage on the same day. Paes was elected by over half a million votes and was proclaimed President on May 9. The Powers recognized the new régime, and on May 27 Great Britain raised her legation in Lisbon to the status of an embassy. The President opened Parliament in July. In Oct. a new Government was formed. Under a new system the President became also premier and ministers were called secretaries of state.

The first anniversary of the revolution was celebrated with national rejoicings on Dec. 5-8 1918. But on Dec. 14 President Paes was shot at the Rocio station by José Julio da Costa, and died a few minutes later. On Dec. 16 Adml. João de Canto e Castro was provisionally elected president, and in Jan. 1919 Senhor Tamagnini Barbosa formed a ministry, reviving the office of premier.

*The Oporto Monarchy.*—The Radical and Carbonario elements, which had hoped to benefit by President Paes' murder, rapidly became impatient, and a Democrat rising now broke out at Santarém, but the town was besieged by Government troops and the rebels surrendered. On Jan. 19 1919 the monarchy was proclaimed at Oporto, Braga and Viseu, Capt. Paiva Couceiro becoming regent and acting also as premier and minister of finance. At Lisbon the Royalists occupied Fort Monsanto and bombarded the city, but they were overcome without difficulty by the marines and Carbonarios. A considerable Republican army was sent against Oporto, but, though part of the regular troops drafted from Lisbon deserted, the Royalist forces were weak and did not reach Aveiro. The fighting during the three weeks of civil war was not of a serious character. A counter-revolutionary movement at Oporto in Feb. led to the restoration of the Republic, and the main result of these ill-timed risings was to fill the prisons and bring the Radicals into power. At Lisbon the marines and Carbonarios, in Feb., demanded government by "soviets" and the abolition of the official police. Severe street

fighting and serious outrages occurred, including the burning down of a block of government offices in Black-Horse Square and of the Limoeiro prison. This had the effect of forcing the new authorities to copy the disciplinary methods of President Paes.

*Government by Groups.*—Senhor José Relvas became premier on Jan. 27 1919, and was succeeded in March by the Democrat, Dr. Domingo Pereira. It now became possible to hold the elections, and in May a Radical majority was returned. On June 1 Adml. Canto e Castro announced his intention of resigning the presidency, the candidate of the Democratic party, Dr. Antonio José de Almeida, being subsequently elected President on Aug. 6. On June 28 the Democratic Col. Sa Cardoso constituted a more stable ministry, which lasted till Jan. 7 1920. There followed a succession of short-lived ministries, under Senhor Fernandez Costa, Dr. Domingo Pereira, Col. Antonio Maria Baptista, Dr. Ramos Preto; Senhor Antonio Maria da Silva, Senhor Antonio Granjo (July to Nov. 15), Dr. Alvaro de Castro, and Lt.-Col. Liberato Pinto (Nov. 29 to Feb. 1921); and on March 2 1921 a new Coalition ministry (composed of Democrats, Reconstituents, Dissidents and members of the Popular party, all offshoots of the original Republican Democrat party) was formed, under the premiership of Dr. Bernardino Machado. A military pronouncement on May 20 caused the resignation of Dr. Machado. He was succeeded by a Liberal ministry under Dr. Barros Queiroz, who dissolved Parliament and held a general election on July 10.

The absence of a firm guiding hand had been especially felt after the murder of President Paes, and successive governments seemed to lose control over the finances. No government was strong enough to raise an internal loan, to revise the system of taxation or levy a war-profits tax, and, while the taxes were paid in worthless paper money, the Government had to buy wheat and pay the service on the debt in gold. Social unrest was chronic in March 1920; there was a general strike of civil, and post and telegraph, servants; a railway strike which began on Oct. 1 1920, lasted 70 days; and a newspaper strike in 1921 for over two months. The Royalists showed themselves willing to exchange revolutionary for constitutional opposition, and King Manoel had constantly deprecated any revolutionary movement in view of the grave crisis through which the country was passing. The death of his uncle, the Duke of Oporto in 1920, left King Manoel without an heir to the throne. D. Miguel, Duke of Viseu, and his father D. Miguel, Duke of Braganza, renounced their right to the throne of Portugal in favour of D. Duarte Nuno, the younger son of the latter, born Sept. 23 1907.

*The World War.*—At a special joint sitting of both Chambers on Aug. 7 1914 Portugal proclaimed her loyalty to the British Alliance, and on Nov. 23 formally committed herself to participation in military operations. She served the cause of the Allies effectively by furnishing munitions, guns, and a division of artillery, and acted in close coöperation with Great Britain. In Oct. a Portuguese military mission arrived in London and a commercial mission followed in November. On Sept. 11 the first expedition of Portuguese troops left for Africa under the command of Colonels Alves Rogadas and Massano de Amorim, and fresh contingents followed at intervals, 40,000 troops in all being despatched for the defence of the colonies. Germany had not waited to be at war with Portugal in order to attack them. As early as Aug. 24 1914 a raid was made on the Portuguese post of Maziwa on the northern frontier of Mozambique. On Oct. 19 the Germans attacked Naulila (on the Angola frontier), where more serious fighting occurred two months later, and on Oct. 30 they stormed the fortress of Kwangar and put the garrison to the sword. On April 11 1916 Portuguese troops occupied Kionga (S. of the Rovuma River), which Germany had seized in 1894, and on May 27 they crossed the Rovuma River. They were still coöperating with the British in rounding up the Germans when war ended.

The British Government had deprecated any unnecessary intervention of Portugal in the war, but agreed to the requisitioning of German ships lying in Portuguese ports, and this was carried into effect in Feb. 1916. Consequently, Germany retaliated by declaring war on Portugal on March 9, and the declaration of

war between Portugal and Austria followed on March 16. The Government resigned in order to make way for a national ministry, constituted on March 15 under Dr. Almeida. Capt. Leotte do Rego was appointed commander-in-chief of the naval division. French and British military missions arrived in Lisbon in March, and a British naval mission arrived in April. In June a first division of 20,000 men was concentrated at Tancos, where training began. Of the Germans in Portugal many had already left and 400 were interned. German submarines were active off the coast of Portugal during the autumn, many ships being sunk in 1917; Ponta Delgada was attacked by one on July 4 1917, and attacks were also made on Funchal and Cabo Verde in December.

On the declaration of war in March 1916 the few Royalist journals still permitted to appear in Portugal made patriotic declarations, and a message from King Manoel in Nov. exhorted his followers to set country above party. In Dec. a revolutionary movement was suppressed at Thomar and its leader, Machado dos Santos, imprisoned. In April 1917 Dr. Costa formed a new ministry. By a decree of Jan. 17 1917 Gen. Fernando Tamagnini de Alorn was given command of the Portuguese Expeditionary Force, and by July there were over 40,000 Portuguese troops on the western front, with 20,000 in Portugal ready to reinforce them. On April 9 1918, on the river Lys, the Portuguese contingent were subjected to a formidable attack by the Germans, and they were compelled to fall back, leaving a large number of prisoners. Subsequently Portuguese troops took part in the victorious entry into Lille.

Dr. Egas Moniz (later replaced by Dr. Afonso Costa) was appointed to represent Portugal at the Peace Conference, and in Jan. 1919, at the instance of Great Britain, the number of delegates to the Conference was increased to two. Portugal came out of the war with a crushing debt, but her colonies were assured to her, and her economic future was promising. The Peace Treaty was ratified on March 30 1920. At the Spa Conference in July 1920 Portugal secured 0.75% as her share of the indemnity from Germany, and also received Kionga.

**Legislation.**—One of the first decrees of the provisional government (Oct. 29 1910) ordained that press offences should be tried before a jury, but the liberty of the press under the Republic was more nominal than real and no Royalist or clerical newspaper was left long unmolested. The law of divorce (Nov. 4 1910) allowed, among other grounds for divorce, insanity, a long term of imprisonment, desertion, inveterate gambling and mutual consent. Gambling, at first legalized, was totally prohibited in 1919. Duelling was forbidden in Jan. 1911. On May 30 1911 Greenwich time was officially adopted, all clocks being advanced 37 minutes at midnight on Dec. 31 1911. In Sept. 1911 the Marconi system of wireless telegraphy was adopted. On June 14 1913 Portugal and Great Britain signed an agreement regulating the opium monopoly in Macao and Hong-Kong. On Aug. 15 1914 administrative and financial autonomy was given to the colonies. The employment of native labour in the Portuguese colonies was regulated by a very elaborate decree of Oct. 14 1914, modifying and developing the law of May 27 1911 and the decree of Oct. 1 1913.

Legislation on the subject of education was voluminous, but comparatively little was achieved to replace the schools of the expelled religious orders. By the decree of March 29 1911 primary education became neutral, laic and compulsory. Each parish was to have at least one boys' and one girls' school, the cost to be shared between the State and the town councils. In the two following years 991 new schools were decreed, but in March 1913 556 were still non-existent. The sum of £40,000 destined in 1913 for the building of primary schools, was apportioned among 180 schools. By a decree of Sept. 11 1913, in order to encourage industrial education and relieve the lyceums of Lisbon, Oporto and Coimbra, the number of students admissible to these latter was limited to a total of 4,850. Secondary education was remodelled by decrees of July 14 and Sept. 8 1918. In May 1914 a military school of aeronautics was created. Other decrees dealt with agricultural credit (1914), accidents to workmen (1913 and 1914) and work of minors and women (1915). On March 9 1918 a Ministry of Agriculture was created, but the decrees stimulating production were of a tentative and contradictory character. Uncultivated land has to pay a small tax per acre and becomes the property of the State if still uncultivated in 20 years from 1911. In March 1921 a much-needed bill was introduced providing for the building of new roads and for the repair each year of 312 miles of existing roads during 1922-31.

**Defence.**—On Jan. 19 1911 a commission appointed to reorganize the navy recommended the acquisition from Great Britain of three battleships of the dreadnought type, similar to the "Minas Geraes" of the Brazilian navy. This recommendation was adopted in the new

naval programme submitted by the Minister of Marine in Dec. 1911, which involved the purchase of 3 battleships of 20,000 tons each, 3 scouts of 3,000 tons, 12 torpedo-boats of 820 tons and 6 submarines. On May 1 1912 a bill was introduced fixing the naval force at 4,500 men, as compared with 5,687 in 1910. On Jan. 27 1913 a commission was appointed for the creation of a naval arsenal on the S. bank of the Tagus.

**Finance.**—The average annual revenue from 1907-8 till the revolution (1910) was £14,455,000, and the average deficit £500,000. After the revolution special attention was given to finance. A committee appointed to examine into various loans made by the State to the House of Braganza assessed the total to June 18 1912 at nearly £800,000, of which £720,000 had been advanced to King Carlos, £24,500 to the Duke of Oporto and £16,400 to Queen Amelia. The Government decided to reimburse itself from King Manoel's property in Portugal.

The budget for 1911-2 showed a deficit reduced to £435,000, but an increased expenditure of £1,026,800. The deficit for 1912-3, estimated at £710,000, was converted into a surplus of £33,400 in August. The 1913-4 budget showed a total revenue of £15,178,843 and a surplus of £195,778, of which £111,800 was destined for the new naval programme. These figures were obtained by adding to the debt. On Aug. 31 1913 the debt stood at £145,917,500, an increase of £1,596,000 over its amount on Dec. 31 1912. In presenting the 1915-6 budget, with an estimated deficit of £2,120,400, it was decided to separate ordinary and war expenditure, but in practice, although two budgets were presented, the expenditure was not kept strictly separate. The double budget of 1916-7 provided for an ordinary expenditure of £17,220,000, with £403,400 deficit, and a war expenditure of £15,000,000. The war added an average of £20,000,000 yearly to the debt, which reached £227,000,000 on July 1 1918. Portugal was further indebted to Great Britain to the extent of £16,000,000 advanced for expenses at the front and £2,000,000 for war expenses in Portugal. The 1920-1 budget, presented in Feb. 1920, before that of the previous year had been voted, showed a revenue of £26,581,000 and a deficit of £25,555,000, an increase of £7,333,000 over the deficit of the previous year. It was proposed to extinguish the deficit by a reduction in the cost of the civil service and a war-profits tax, calculated to yield £22,222,000, but the Government fell before the proposals could be carried into effect. In Dec. 1920 heavy property and industrial taxes were imposed. By the 1921-2 estimates, presented in Jan. 1921, the deficit was increased to £58,888,000 on a total expenditure of £106,610,000. At the end of 1920 the debt was unofficially estimated as follows: external £53,777,000, floating £123,939,000, internal £325,333,000—total £503,049,000. The paper currency, which at the end of 1910 stood at £16,000,000 (at par of exchange, namely, 4,500 reis = £1), had risen to £82,361,000 in Dec. 1919, and to £118,361,000 in Sept. 1920. A further increase of £44,444,000 was voted by Parliament in Dec. 1920. In that month the 3% external debt was quoted at 22. The agio on gold, which was 5 in Oct. 1910 and 16 in Aug. 1914, exceeded 1,100% in Feb. 1921, but fell to half that amount a few months later. The floating debt, which immediately before the war was £19,555,000 (at par of exchange), stood at £119,555,000 on Dec. 31 1919. The heavy depreciation in the exchange, however, must be allowed for.

In Feb. 1921 the Banco Nacional Ultramarino became the sole agent of the Royal Bank of Scotland and of some English banks.

**Commerce.**—Portugal's foreign trade, which in 1913 had reached £22,094,500 in imports and £11,355,000 in exports, further expanded during the World War, and in 1917 amounted (at par of exchange) to £37,391,700 imports and £19,121,500 exports. The trade between Portugal and her African colonies almost doubled between 1911 and 1917. In 1917 5,860 ships of 4,906,599 tonnage entered Portuguese ports, as compared with 10,638 of 24,368,120 tonnage in 1913. The total tonnage of German ships seized in 1916 was 242,441, of which 157,333 were handed over to the Allies. Portugal lost 28,637 tons of shipping by enemy action, and her merchant shipping at the end of 1918 stood at 100,000 tons.

A treaty of arbitration for five years, between Portugal and Great Britain, was signed at London on Nov. 16 1914. The commercial treaty between the two countries, signed at Lisbon on Aug. 12 1914, became effective on Sept. 3 1916.

**Foreign Exchange.**—After the war serious efforts were made to grapple with the problem of the exchange, which was aggravated by the decree of May 31 1919 placing the financial agency at Rio de Janeiro in private hands. A decree of April 27 1918 provided that when the exchange was at 20%, 50% of the customs duties should be paid in gold at that rate and 50% at par, until the exchange reached 38%, when the whole of the duties was to be paid in gold at par. A decree of Feb. 4 1920 totally prohibited a large number of imports, thus depriving the exchequer of an important source of revenue. Neither the Banking Consortium (Jan. 10-May 26 1920) nor the attempt to fix the rate of exchange officially, was effective in preventing a further rapid depreciation in Portuguese money, owing to the almost complete absence of gold (the reserve having fallen to under 2% in 1920) and to decreased production. As a result of the cost of labour and the fixed price of bread, cultivation of wheat diminished steadily from 1918, its best year. In 1918 the 248 million kgm. produced fell short of requirements by 56 million kilograms. The most important export trade—wine—suffered during the war from trans-

port difficulties and, later, from the reduced demand in Great Britain and the loss of the markets of the United States, Canada, Russia and Norway. The wine trade attained its maximum in 1919, when the cost of transport fell from £15 to £4 a pipe and Great Britain imported 12,458,220 gallons. In 1920 Great Britain imported only 5,914,575 gal. and a huge stock was left on the hands of the merchants. Portuguese manufacturing industries, which expanded considerably during the war, despite the coal shortage, were similarly affected by decreased demand in 1920, for which the expansion of colonial trade did not entirely compensate.

**Population.**—The pop. of Portugal numbered 5,547,708 in 1911, not including the inhabitants of the Azores and Madeira, which amounted to 412,348 in the same year. The pop. of the chief towns (1911 census) were: Lisbon 435,399, Oporto 194,099, Setúbal 30,346, Ilhavo 14,130, Póvoa de Varzim 12,115, Tavira 11,665, Faro 12,680, Ovar 11,416, Olhão 10,890, Viana do Castelo 10,486, Aveiro 11,523, Loulé 19,688, Coimbra 20,581, Évora 17,901, Covilhã 15,745, Elvas 10,645, Portalegre 11,603, Palmella 13,318, Torres Novas 13,961.

**Literature.**—Literature in Portugal from 1911 to 1921 was marked chiefly by the death of prominent men of letters—of philologists, Gonçalves Viana (1914), Epiphânio Dias (1916), Júlio Moreira (1917) and Adolpho Coelho (1919); critics, Ramalho Ortigão (1917) and D. Maria Amélia Vaz de Carvalho (1921); novelists, Fialho de Almeida (1911), Abel Botelho (1917) and Teixeira de Queiroz (1919); the dramatist, Marcelino Mesquita (1919); poets, António Feijó (1917), João Penha (1919) and Gomes Leal (1921). But although the revolution was followed by no great literary revival, most useful work was accomplished, including much-needed and important reprints and editions of the classics. Among these may be mentioned the scholarly editions of Dr. J. J. Nunes and of Dr. Esteves Pereira, who in 1918 published the *Livro da Montaria* of King João I. from the original manuscript. Valuable material for the future historian of Portugal was brought together by the researches of several scholars, among whom Mr. Edgar Prestage specialized on the 17th century. The *Revista de História* has been published regularly since 1912. Senhor J. Lucio de Azevedo followed up his *Life of Pombal* with notable studies on Antonio Vieira. Dr. Leite de Vasconcellos' invaluable *Revista Lusitania* reached its 20th volume in 1917. In poetry a national tendency set in which is strongly marked in Dr. Lopes Vieira's *Ilhas de Bruma* (1917). The veteran poet, Senhor Guerra Junqueiro, published *Poesias Dispersas* in 1920. In the field of essay the glowing style and national fervour of Senhor Antero de Figueiredo in *Leonor Teles* (1916), *Jornadas em Portugal* (1918), *Recordações e Viagens* (2nd ed. 1916), and other works, are notable. The growing interest in Portuguese literature in England was marked by the foundation of a circle of Portuguese literature at King's College, London, in 1917.

**BIBLIOGRAPHY.**—For general study of the country see L. Poincard, *Le Portugal Inconnu* (1911); A. Marvaud, *Le Portugal et ses Colonies* (1912); G. Diercks, *Das Moderne Portugal* (1913); A. F. G. Bell, *Portugal of the Portuguese* (1915); G. Young, *Portugal: An Historical Study* (1916); Bento Carqueja, *O Povo Portuguez* (1916) and *O Futuro de Portugal* (2nd ed. 1920); Ezequiel de Campos, *A Conservação da Riqueza Nacional* (1917); Capt. Herculano, *História de Portugal*, illustrated edition in 8 vols. (1914-6); H. da Gama Barros, *História da Administração pública em Portugal nos séculos XII. a XV.* (3 vols. 1895-6 and 1914); Dr. Mendes dos Remedios, *História da Literatura Portuguesa* (5th ed. 1921); F. de Figueiredo, *História da Literatura Romântica Portuguesa* (1913), *História da Literatura Realista* (1914), *História da Literatura Clássica* (1917), dealing with the 16th century, and *A Crítica Literária como Ciência* (3rd ed. 1920). What purports to be a summary of the literature of Dr. Theophilo Braga consists of 4 vols.: *Edade Média* (1909), *Renascença* (1914), *Os Seiscentistas* (1916), *Os Arcades* (1918). (A. F. G. B.)

**PORTUGUESE EAST AFRICA, or MOZAMBIQUE** (See 22.163).—As the result of the World War in what was formerly the German territory adjoining, Portuguese East Africa has become bordered landward entirely by British, or British administered, territory. In 1919 "the Kionga triangle," some 400 sq. m. in size, and including the southern shore of the estuary of the Rovuma, was transferred to the province—having been part of German East Africa. The pop. in 1918 was roughly estimated at 3,000,000 to 3,500,000; no systematic census had been made and the inhabitants in areas not controlled by the Portuguese were not included. Europeans, exclusive of troops, numbered some 12,000; Asiatics (mainly Indian traders) 15,000-18,000. Lourenço Marques, the capital, with suburbs had about 20,000 inhabitants of whom 5,500 were white (700 being British).

**Products and Trade.**—An increase in the area under sugar, greater attention to the plantations of coco-nut palms (for copra), the introduction of sisal growing (from German East Africa) and the cultivation of maize for export were directions in which endeavours

were made to increase the resources of the province in 1911-21. The sugar plantations were mainly in the region between Beira and the Zambezi, a region governed under charter by the Company of Mozambique, in which British capital was largely interested. Between 1911 and 1919 the area under sugar trebled and the output reached 35,000 tons yearly. Most of it was produced by the Sena Sugar Co. and shipped at Beira. Sisal was cultivated mostly in the Quilimane area; in 1916 the export was 2,200 tons of fibre.

Before the World War trade was mainly divided between British, Portuguese and Germans; the Germans financed the Banyans (Indian traders) who retailed "Kaffir truck" to the natives, a business worth £250,000 or more a year. In return the natives sold, principally, ground nuts of which some 2,000 tons were exported annually. North of the Zambezi German merchants had nearly all the trade, both import and export, and had begun to oust even the Banyan. In the S., at Delagoa Bay and Beira British, firms held over 50% of the trade. The war eliminated the German trader.

No uniform system of trade statistics was adopted in the three administrative areas into which the province was divided. The following figures are approximations to accuracy:—in 1911 imports £8,250,000, exports £2,250,000. The imports include some £6,800,000, in and out transit trade through Delagoa Bay and Beira. For 1913 the imports (excluding transit trade) were given at £2,053,000; exports at £2,720,000. Portuguese figures for 1917 (excluding Beira) gave the imports at £2,800,000; the exports at £1,500,000, not reckoning transit trade or re-exports.

The imports for local use were mainly textiles, provisions and machinery. Large quantities of wine, "vinho colonial," are imported from Portugal for native consumption—in 1913 the amount received at Lourenço Marques alone was 1,620,000 gallons valued at \$105,000. In 1920 alcohol was declared by the high commissioner of Mozambique to be the curse of the province. The great bulk of the trade was in transit to or from the Transvaal, Rhodesia or British Nyasaland. The import of most direct benefit to the province was coal from the Transvaal. From 1912 onward Lourenço Marques became important both for the export and bunkering trade. (For the relations of the province with the Transvaal see DELAGOA BAY.)

**Communications.**—During 1910-20 several short lines of railway were built from the seaports. The largest scheme was to connect Delagoa Bay and Inhambane. This line with a total length of 280 m. was planned in independent sections, and 160 m. had been completed by 1916; the central section had not been built in 1920. The building of a railway (about 170 m. long) from Beira to the Zambezi, opposite Chindio, was begun in 1920 under a guarantee of the British Nyasaland Protectorate, its object being to afford that protectorate an ocean gateway. From Chindio a railway, completed in May 1915, goes to Port Herald where it connects with the Shire Highlands railway. A route for a railway from Port Amelia 30 Lake Nyasa was surveyed in 1912. The line would have been built by a German company but for the outbreak of the World War. Up to 1921 a few miles only of rails had been laid from Port Amelia. Wireless telegraph stations have been erected at Delagoa Bay, Inhambane and Mozambique town.

**Finance.**—Revenue was obtained chiefly from a poll tax, customs and taxes on emigration, i.e. a poll tax paid to the provincial authorities for natives recruited for the Transvaal gold mines and other work. In 1913-4 revenue and expenditure were budgeted for £1,312,000; in 1917-8 at £1,809,000. "Cost of administration" was given as the chief item of expenditure, not unreasonably, as in 1917 there were over 10,000 persons in Government pay.

**History.**—The efforts made by chartered companies and reforming governors to develop the province left its vast natural resources up to 1920 scarcely touched. The Portuguese lacked capital with which to undertake large operations, the settler class was not on the whole of a satisfactory character, the administrative system was very defective, and up to 1914 the interests of the province were entirely subordinated to the assumed interests of Portugal. In that year following an agitation in which the then governor-general of the province, Senhor de Magalhães, took the lead, Mozambique was granted partial autonomy and in 1920, when Dr. Brito Camacho was appointed high commissioner, further reforms were enacted. The general trend of events during 1910-20 was to show the province as of value chiefly as a passage-way to and from the Transvaal, Rhodesia and British Nyasaland. Partly because of the necessity of keeping this passage-way open it was in this period that Portuguese authority was first made fairly effective throughout the province. Moslem chiefs along the coast in the region opposite Mozambique Island were subjugated by 1910, after a four years' contest, and the hinterland tribes then submitted with little resistance. The occupation of the interior of Portuguese Nyasaland, begun in earnest in 1909, met, however, with strong opposition from the natives and was not completed till 1912, when Mataka, the most powerful opponent of the

Portuguese, fled across the Rovuma into German territory. In 1915 there was a widespread revolt in the Zambezi valley and farther S., which was not fully suppressed till the end of 1917.

The paramount economic interests of Great Britain in the southern part of the province, including the delta of the Zambezi, were recognized in the Anglo-German draft agreement prepared in 1913-4, but not signed owing to the outbreak of the World War. By that agreement the part of the province N. of the Liconga (Licungo) river (which reaches the sea over 100 m. N. of the Zambezi delta) was to be in the economic sphere of Germany (see *AFRICA: History*). The larger part of this northern area was governed, under a charter, by the Nyasa Company. That company, for lack of funds, had done little to develop its territory. In 1914 German capitalists succeeded, through a neutral intermediary, in obtaining control of the Nyasa Co. and by the aid of a German directorate they sought to acquire political control, and advance the scheme for the creation of a German Mittel-Afrika. The World War put an end to this design.

Early in 1917 German raiding parties entered Portuguese territory and in Nov. of that year Gen. von Lettow Vorbeck, to escape capture crossed into the province from German East Africa, carrying on the war there for nearly a year (see *GERMAN EAST AFRICA*). Von Lettow helped to prove the natural resources of the regions he traversed, while aerial reconnaissances by the British gave material for mapping.

See *A Manual of Portuguese East Africa and Portuguese Nyasaland*, both British Admiralty publications (1920); *Mozambique*, a handbook issued by the British Foreign Office (1918-9)—all with bibliographies; *The South and East African Year Book and Guide*, ed. by A. S. and G. G. Brown (London yearly); the *Anuario Colonial* and *Revista Colonial*, both Lisbon publications. (F. R. C.)

**POTIOREK, OSKAR** (1853— ), Austro-Hungarian general of artillery, was born at Blieburg, Carinthia, in 1853. He graduated from the Engineers' Academy as lieutenant in 1871. His career was chiefly spent on the General Staff, of which he was one of the most distinguished representatives. He held there the important post of Chief of the Section of Operations, later that of Deputy to the Chief of the General Staff, Count Beck. After Beck's retirement he was in command of the III. Corps, in 1911 Army Inspector and Governor (*Landeschef*) in Bosnia and Herzegovina. As such, he was officially responsible for countenancing the fateful visit of the heir to the throne to Serajevo, out of which the World War ensued. In the offensive taken by Austria against Serbia in the winter of 1914, which eventually broke down after great initial success, his judgment was also found wanting.

**POULTRY** (see 22.213).—During 1900-20 there were many changes and developments in the poultry industry, as carried on in Great Britain. New breeds were evolved or imported, while some of the older breeds have diminished in popularity and, except for small numbers kept by persistent breeders, have almost died out. Far more striking, however, has been the rapid evolution of the present-day utility breeds, the extension of public "laying trials" and the development of extensive commercial egg farms and breeding farms, accompanied by new mass methods of hatching, rearing, feeding and housing. The agriculturist has shown slowly increasing interest in poultry-keeping as a business branch of farm operations, and there has been a notable expansion of poultry-keeping by residents in urban and suburban areas. The view so strongly held for many years by the majority of people—who thought about the matter at all—that poultry-keeping was not a practicable commercial proposition except as a small side-line, and in circumstances where waste food for the birds was available at little or no cost, has been very much modified, for the reason that poultry-keepers, who have derived the main portion of their livelihood over a period of years from one or more branches of the industry, have so obviously increased in numbers. In addition numerous authentic instances of profitable results obtained from poultry-keeping as a subsidiary occupation have been made public. Hence in recent years increasing numbers of people have turned their attention to poultry-keeping, and in several instances the capital involved

in well-known poultry farms amounts to several thousands of pounds. So far successful British poultry farming comprises one or more of the following branches:—Breeding laying strains of poultry; the production of exhibition stock; the sale of day-old chicks, eggs for hatching and stock birds; the production of eggs and poultry for consumption. The production of table poultry is in practically every case a subsidiary branch, and was particularly so during the war owing to the scarcity of feeding-stuffs.

It is not possible to form any reliable estimate of the value of the poultry-stock-breeding industry in the United Kingdom, as no complete figures are available. Every experienced observer knows, however, that the increase in the demand for and supply of eggs for hatching, day-old chicks, and pure-bred stock birds, has been very considerable during the past few years. Nor can any reliable estimate be made of the growth of table poultry and egg production, since there are insufficient data upon which to base an estimate. It is possible, however, to make a rough estimate of the total annual value of table poultry and egg production.

In 1908, in connection with the Census of Production Act of 1906, the Board of Agriculture and Fisheries published a poultry census for Great Britain showing that the number of poultry kept by occupiers of agricultural holdings exceeding one ac. in extent was 36,728,000. In its report, however, the Board draws special attention to the limitation of the scope of the returns to holdings exceeding one ac., and points out "that poultry are very largely kept by cottagers and persons who do not come within the definition of agricultural holdings, while a further very large poultry population would no doubt be enumerated if the returns were extended to the towns."

In addition to obtaining this census, each occupier was asked to state the number of home-bred poultry of each description sold during the preceding twelve months, and special schedules were issued to all occupiers returning not less than 50 fowls or 10 ducks, geese or turkeys, asking for the number of males and females, respectively, hatched before 1908, the number of eggs produced, sold for consumption, or sold or used for hatching, and the number of young and adult birds sold. As a result the report states that there were 15½ million adult hens on farms in Great Britain in 1908, that the average annual egg yield per hen was 72, and that the total value of the output of eggs and poultry was calculated to be about £5,000,000. The report, however, emphasizes the fact that this sum "takes no account of poultry kept by cottagers, residents in towns and others not within the scope of the Agricultural Returns. The aggregate production thus excluded must be very large, though again it may be assumed that the greater part of it is consumed by the poultry-keepers themselves."

Since 1908 no poultry census figures for Great Britain are available, but interesting deductions may be made regarding British production by examining the returns published for the years 1908 and 1918 by the Irish Department of Agriculture regarding the Irish poultry industry. The Irish returns refer to all agricultural holdings including labourers' cottages built under rural housing schemes and are thus more comprehensive than those for Great Britain, though like the British returns they apparently take no account of town poultry-keepers. The number of such poultry-keepers in Ireland, however, would be insignificant as compared with the number in Great Britain. The total number of poultry in Ireland in 1908 is given as 24,031,095. The report estimates the average annual egg yield of Irish hens as 100, and calculates the total value of Irish poultry production in 1908 at £5,290,000. Of this amount £3,526,000 was stated to represent the value of the exports, £1,764,000 the value of the home consumption.

In 1918 the Irish returns give the total number of poultry in Ireland as 24,424,230, and state that the value of the exports of eggs and poultry was £18,352,578. No figures are given regarding the value of the home consumption, but in view of the value given in this connection in 1908 it may be fairly assumed that £4,000,000 represents a reasonable estimate. Thus a total production value of £22,352,578 is arrived at for the Irish poultry industry in 1918. Now it is difficult to believe that the average yield of hens in Great Britain is less than that of their sisters in Ireland, and it is certain that the average price realized by British producers for their eggs and poultry have been greater than those obtained by Irish producers. Hence, if the incomplete British census for 1908 be taken, and even if it be assumed that there was no increase in the numbers in British poultry between 1908 and 1918, the total value of the produce from the 36,728,000 poultry in Great Britain would amount to approximately £33,000,000 for 1918, if calculated on the same unit production value as the Irish figures. But unit production value is almost certainly higher in Britain, if only on account of higher prices, and the total of £33,000,000 takes no account of the value of the produce of the large numbers of poultry kept in Great Britain by dwellers in urban and suburban districts. What this value may be can only be estimated, but it is practically certain to be well over £4,000,000 annually. A final estimate of £37,000,000 is thus arrived at as the value of British egg and poultry production in 1918, and if to this figure be added the corresponding one for Ireland a total of roughly £60,000,000 is obtained for the United Kingdom.

It is interesting in comparison to note that, according to an answer given by Sir R. Sanders for the Minister of Agriculture in the House of Commons on Feb. 24 1921, the estimated value of the total wheat crop of the United Kingdom in 1920 was £31,000,000. Also in a recent Report on the Trade in Imports and Exports at the Irish ports it was stated that the value of the Irish eggs, poultry and feathers exported was in one year greater by about £13,000,000 than the store cattle trade and nearly equal in value to the export in fat cattle.

There is a further important aspect of the effect of the demand for table eggs and poultry in the United Kingdom in the national finances, viz. the large sums paid annually to foreign countries for supplies to supplement the insufficient home production. Tables 1 and 2 show the annual quantities and values of these imports for the years 1913, 1919 and 1920:—

TABLE 1.—Imports of Eggs, in Shell, into the United Kingdom.

France	31,175	3,083	27,112
Austria-Hungary	26,674	Nil	1,396
U. S. A.	54,242	100,859	9,872
Other Countries	46,430	43,617	56,018
Total quantities	278,465	147,567	94,464
Total values	£954,540	£1,527,992	£817,872

The figures in Tables 1 and 2 show that in 1920, as compared with 1913, the total value of imported eggs and poultry had increased from £10,545,142 to £12,396,968, whilst the total quantity had decreased in the case of eggs from 21,579,950 great hundreds to 7,070,266 great hundreds; and in the case of dead poultry from 278,465 cwt. to 94,464 cwt. Thus, reckoning that the eggs averaged 14 lb. per 100, the imports in 1920 were less by 90,685 tons than in 1913, whilst the imports of dead poultry were less by 9,200 tons. It appears, therefore, that the total annual value of the eggs and poultry consumed in the United Kingdom had in 1920 reached the following approximate huge sum:—

British production	£37,000,000
Irish	22,352,578
Imported	12,396,968
Total	£71,749,546

From the foregoing it would seem that the opportunities for increasing the production of eggs and poultry in the United Kingdom were in 1921 greater than ever. Russia, the largest supplier in pre-war days, had practically ceased her exports, whilst Italy and the countries formerly included in Austria-Hungary would probably take some years to recover their former exporting capabilities. Much must depend, however, upon the capacity of the British people to adopt efficient methods of cheaper production. There is little doubt that the majority of British consumers would prefer to eat fresh British eggs and poultry rather than those of foreign origin, preserved or otherwise, provided the price of the home article is not too high. It is largely a matter of cost of production and methods of marketing.

One of the most interesting developments in poultry-keeping of recent years has been the growth of stock poultry farms whose main object is the production of pure-bred poultry of heavy laying capacity. This development was no doubt primarily due to

the increasing appreciation shown by poultry-keepers of the commercial importance of high egg yield, and the consequent demand for stock, specially selected and bred for this quality. A great stimulus was given to this development by the introduction of public laying competitions, the object of which was to test the egg-producing capacities of various breeders' birds and also to gain information regarding the relative fecundity of existing strains and breeds. The introduction of these laying competitions in England was due to the enterprise shown by the Northern Utility Poultry Society of Burnley, Lancashire, and the Utility Poultry Club (now the National Utility Poultry Society), and at first

competitions were conducted over four winter months, commencing in October. Thus the productive capacity of the birds was tested at the time of the year when eggs are most difficult to obtain, and competing breeders were compelled to hatch their birds early if they wished them to obtain a good place in the trials.

The introduction of these competitions marks an important epoch in the history of the poultry industry, as attention was thereby focussed upon the great variation in fecundity of various strains and breeds, whilst the commercial importance of high egg yield was forcibly demonstrated. For the first few years trap-nests were not used, records of the egg yield of each pen of four birds being taken. In 1902, however, trap-nests were introduced and the individual records were taken. In 1912-13 the competitions were extended to twelve-month periods, and a grant in aid of this work was given to the Utility Poultry Society in conjunction with the Harper Adams Agricultural College, Newport, Salop, by the Board of Agriculture and Fisheries. It was no doubt realized by the Board that the educational value of these competitions was very great. Not only was information obtained regarding the relative productivity of different birds, "strains," and breeds, but also regarding size and colour of egg, comparative seasonal production, period of brooding, cost of food per bird and net cost of egg production, value of different systems of housing, feeding, and general management. In fact it is open to question if the full educational value of laying competitions or trials had in 1921 been fully exploited.

The National Utility Society continued to organize trials annually, and after 1916-17 these were carried out for the Society by the Great Eastern Railway Co. at Bentley, Ipswich. This Company in conjunction with the Utility Duck Club also arranged in 1921 a laying trial for ducks. The trap-nesting arrangement for these birds is very ingenious as the ducks are enticed into the nests by regularly placing the food in small pens in front of the nests, but inside the

traps. Only one duck can obtain admission to each pen or nest, and as the birds are plainly marked with distinctive rings very little handling is necessary.

Several other public laying trials were being conducted in 1921 in various parts of the United Kingdom: at Burnley, Lancashire, by the Northern Poultry Society; at Newport, Salop, by the Harper Adams Agricultural College; at Wye, Kent, by the South Eastern Agricultural College; at Birmingham by the Midland Fur and

at too high a cost in other directions and that high resistance to disease, low chicken mortality, and reasonably sized eggs are also matters of considerable importance.

The type of bird bred by the breeder of pedigree layers has drifted further and further away from the standard set up by the specialist exhibition clubs. So much is this so, that in the case of several breeds, particularly White Leghorns and White Wyans-

Feather Federation; at Trowbridge by the Wiltshire County Council; and in Ireland at Cork by the Irish Department of Agriculture. In the case of the trials at Newport, Wye and Trowbridge, financial assistance to the work is given by the Ministry of Agriculture.

As a brief indication of the results obtained at a few of the laying competitions the accompanying tables are instructive. (Tables 3 and 4 have been compiled by Mr. H. E. Ivatts, late Hon. Sec. of the National Laying Trials.)

Up to the 1916-17 competition awards were granted upon the basis of the market value of the eggs laid with a varying discount penalty up to 20% upon eggs weighing less than 2 ounces. Subsequent to 1916-17 the competitive value of a hen's production was determined in accordance with the following rule:—

"For the purpose of the test the eggs laid by each hen will be assessed and recorded according to their weight as first or second grade eggs. First grade eggs shall be those weighing two ounces or more. Second grade eggs during the first ten weeks shall be those weighing less than 2 ounces but not less than 1½ ounces, and for the subsequent period of the test not less than 1¼ ounces. Second grade eggs shall be accepted as of equal value to first grade eggs, but not more than 100 eggs shall be credited to the score of any hen in Sections 1 to 5, and in the case of Section 6 (Championship) 200 eggs."

The 1915-16 trials held by the Utility Society have a special interest, as 42 of the competitors' pens were retained for a second year in order to ascertain the yield of these birds for their second year. Table 4 shows the results obtained.

The stimulus given by laying trials to the breeding of highly fecund strains of poultry has been enormous. Not only has the spirit of competition set up by the trials urged breeders to devote much time and thought and energy to their breeding operations, but the fact that a win in a public competition is of great value as an advertisement led to the keenest efforts being made by competitors to obtain a high position in the prize list. It is perhaps not too much to say that success in the trials has been in several cases the foundation of many present-day successful stock poultry farms. Ordinary poultry-keepers wishing to buy birds either as a beginning or to improve existing stock apply to a large extent to successful competitors in the laying trials, and a considerable foreign demand at highly remunerative prices is not infrequently the direct result of success in the trials. This is certainly a mark of progress in the egg-producing industry as a whole, in the same way that the increasing demand for pedigree milking stock by the dairy farmer is an indication of progress in the dairying industry. A word of caution, however, may not be misplaced. There may be a danger in focussing attention too strongly on the development—possibly the abnormal development—of one function, or producing weaknesses in the bird in other directions. There is a certain risk of sterility, high mortality in rearing chickens and general lack of constitution in the adult stock. The really skilled breeder will know how to avoid these dangers, but nature is inclined to be severe on attempts to develop abnormal capacity in any one direction. Our knowledge of the laws of heredity is still very incomplete in spite of the considerable amount of empiric knowledge possessed by some of our present-day breeders. No doubt Mendel's discoveries and the investigations made by Bateson, Punnett, Pearl and others may give material assistance to the elucidation of the many problems involved in the inheritance of fecundity, but in the meantime stock breeders and commercial egg farmers would do well to remember that high individual egg yield may possibly be obtained

dottes, the birds which win in laying competitions are of a type distinctly different from exhibition specimens and are indeed given a distinguishing designation such as Utility White Leghorns in contrast to Exhibition White Leghorns. Apparently the heavy layer develops a type of her own and if, as appears probable, the future demand for stock poultry should be increasingly for birds whose useful qualities, whether for egg or flesh production, have been highly developed, it is obviously desirable that British breeders of exhibition and utility poultry should take counsel together and if possible frame their breed standards to meet present-day requirements. Otherwise, confusion is likely to increase with resulting loss of trade both at home and abroad.

The Irish Department of Agriculture have held annual eleven-month laying trials in Ireland since 1913, and, as the results are published in a form which facilitates comparison, Table 5 is of interest:—

TABLE 5—Comparison of Results.

Most of the so-called "commercial egg farms," which have become more in evidence of recent years, are stocked with Utility White Leghorns, White Wyandottes, or Rhode Island Reds. The main business of these farms is to produce eggs for consumption though most of them do also a certain amount of trade in supplying eggs for hatching, day-old chicks, and stock birds. One of the largest British commercial egg farmers, however, who maintains a flock of 5,000 layers and rears some 5,000 to 6,000 chickens every year, states that nine-tenths of his produce is sold for direct consumption and that he regards the hatching egg and stock cockerel trade as comparatively unprofitable and troublesome. All hatching and rearing on this particular farm are done with broody hens, no incubators or foster-mothers being used, and this has been the practice for many years. It has proved commercially successful in this particular case, though other egg farmers use mammoth incubators and pipe brooder houses or anthracite stove hovers with apparently successful results. There is little doubt that the capacity for rearing large numbers of chickens with a low percentage of mortality is the crucial test of the commercial egg farmers' skill and management, and much has yet to be learnt regarding the rearing of chickens in large flocks. Considerable differences of opinion exist as to the comparative merits of pipe brooder houses, anthracite stove hovers, brooder houses with small portable oil hovers, outdoor portable brooders, and natural methods. When the pipe brooder system as practised in America was first tried in England many failures were recorded. Since then, however, improvements have been introduced and there is some evidence that the improved form of pipe brooder house may yet become popular in Britain. At least one large breeder has erected a brooder house of this type with a capacity of from 3,000 to 5,000 chickens and excellent results have so far been obtained. The anthracite stove brooder is now in use in considerable numbers, but opinions vary widely as to its efficiency in rearing a high percentage of vigorous well-grown chickens.

Methods of housing and feeding hens kept principally for table-egg production vary considerably. The usual practice is to keep the birds in comparatively large flocks of from 150 to 400 and to house them in open-fronted scratching-shed houses, the original type of which was probably introduced from America. These houses are not uniform in type, some being 14 ft. deep with special back ventilation whilst others are built only 9 ft. deep and depend for ventilation entirely on the open front. In Lancashire

the open-fronted house is very little used, a span-roofed type with windows low down near the floor being preferred. The amount of run provided for the birds also varies. One well-known poultry farmer maintains 400 layers to the ac, but divides the acre into two portions, and whilst the birds occupy one portion forage crops, such as thousand-headed kale, which the birds later on consume, are grown on the other portion. On another farm the laying-houses are so placed on the farm and the wire fencing so arranged, that the birds can be given access to arable fields, fruit gardens or pasture, as the crops and the season permit.

In methods of feeding, too, there is also wide variation. The dry mash method is practised on certain farms whilst on others the wet mash method is preferred or a combination of the two. On some well-known egg farms large quantities of cooked vegetable food are regularly fed to the layers, whilst on other farms

very little green food is given beyond what the birds gather for themselves on their runs.

From all this it will be gathered that methods are far from being standardized in the poultry industry, and this is indeed not a matter for surprise when the recent development of poultry-keeping as a business is considered. Unlike agriculture, which is man's oldest industry and has been for many years investigated both from the scientific and practical aspect by some of the best brains, there has been little scientific or even practical investigation into poultry-keeping methods in the United Kingdom. For the novice therefore, who may well feel doubtful as to the best system to adopt, the soundest procedure is probably to obtain information as to the methods practised on several successful poultry farms and then to adopt a method which appears to combine the good points of several.

The keeping of poultry in England by urban dwellers, with gardens or even small backyards, and by allotment holders, received a great stimulus during the war, owing to the falling-off in supplies of imported eggs and the necessity for converting all the edible household and garden waste material into human food. It was soon realized that a limited number of laying hens could be maintained under intensive conditions in small backyards and gardens, at comparatively low cost. The necessary labour could be provided within the family, and first-class eggs produced at the point of consumption at much lower outlay than that involved in purchasing inferior shop eggs. Furthermore, eggs so produced were actually on the consumers' premises. Difficulties and expenses of transport did not affect the supplies, provided a limited amount of additional feeding-stuffs could be obtained to supplement the household and garden waste material. This development in urban poultry-keeping would no doubt have proceeded much more rapidly than it actually did had the supply of chickens, pullets, and hens been greater. Unfortunately, however, poultry-breeders were unable to obtain supplies of feeding-stuffs freely and hence were obliged to restrict their breeding operations. Consequently the demand for laying stock by town dwellers could not in many cases be satisfied, or was met by supplies of old hens which gave disappointing results. In any case urban poultry-keeping has taken a firm hold, so much so that local sanitary authorities and town property owners are showing concern as to possible interference with the amenities of properties in urban areas, and local by-laws and clauses in leases which were more

or less ignored in many cases during the war are now being strictly enforced. It is to be hoped that town poultry-keepers will so regard the requirements of hygiene and sanitation in thickly populated areas that no serious cause for complaint with subsequent restrictive action on the part of local authorities may arise, as undoubtedly "backyard" poultry-keeping can give powerful assistance in reducing the necessity for large importations of foreign eggs.

For backyard, allotment and garden poultry-keeping the intensive system of housing is usually adopted, though in some cases where sufficient space is available open or covered runs for the birds may be provided in addition to the house. Under the strictly intensive system the birds are permanently confined to the house which should afford four or five sq. ft. of floor space to each bird. It is essential that the floor of the house be kept dry and some 4 in. to 8 in. of bedding should be provided amongst which grain should be scattered from time to time so as to induce the birds to take necessary exercise by scratching amongst the litter for the grain. The intensive house is usually of a lean-to open-fronted type so designed as to admit as much sunlight as possible on to the floor in the winter months and yet to keep out rain, snow and wind. It may be built of wood,  $\frac{3}{4}$ -in. tongued and grooved match-boarding is often used,—asbestos sheeting, or even mainly of felt. As a backyard or garden poultry house is often of a more or less permanent nature it is usually more economical in the long run to use sound materials which are likely to need little repairing. A house of this type, which should be high enough to permit of easy cleaning, may be built for six or eight hens in quite a small backyard, and provided it is kept quite clean and no male birds are kept no offence is likely to be caused to neighbours even in a crowded city district. In circumstances such as these, however, it is inadvisable to attempt hatching and rearing, and the egg supply is likely to be more satisfactorily maintained if fresh pullets are purchased at the end of each summer and the hens disposed of which have been kept intensively for about a year, and have temporarily ceased laying and commenced to moult.

If space permit a covered run may be provided adjoining the house, but the floor material, especially if of soil or sand, must be kept scrupulously sweet and clean. The top surface should be raked off and renewed from time to time and occasionally a little disinfectant powder may be sprinkled in the run. Extra accommodation of this sort is, however, not really necessary for laying stock kept under proper intensive conditions for one year only, and most backyard poultry-keepers with limited space at their disposal will find an intensive house constructed on sound lines most suitable for their purpose.

The Sussex poultry-fattening industry, which had become of considerable importance in the three south-eastern counties prior to the war, has become almost extinct owing to the high price, and the difficulty in obtaining supplies, of the Sussex ground oats which were invariably used for cramming the birds. Apart from the fact that it was considered uneconomical in war-time scarcity to use concentrated feeding-stuffs for the production of the highly finished, crammed Surrey fowl, supplies of store chickens were difficult to obtain, feeding-stuffs were very short and were rationed, and, owing to the shortage of fresh meat, chickens found a ready market in almost any condition. Thus the old Sussex fattening industry gradually died out, though of course chickens continued to be reared as far as conditions would permit and were marketed as a rule without cramming or special fattening.

There have been some indications of a revival of the cramming practice, but Irish supplies of store chickens having been diverted for direct sale in London and elsewhere, and poultry-raisers having accustomed themselves to selling their birds for direct consumption without additional fattening, it may be that any general revival of cramming will be long deferred. Much will depend upon the public demand and this will no doubt revive to an increasing extent if supplies of the former high-quality crammed chickens become greater. The practice of trough feeding chickens in fattening coops for a week or so in order to give them a little extra finish is still continued to a certain extent during the late summer, and this practice has much to commend it. Less skill is required than in cramming; it is more economical of feeding-stuffs, and though the chickens cannot be as highly finished as by the crammer, good-quality table birds can be produced which are readily saleable at satisfactory prices.

Like the Sussex cramming industry, the old-established Aylesbury duck-fattening industry, as well as duck-fattening farms outside Buckinghamshire, became practically extinct during the

war, but duck farms were bound to reappear as feeding-stuffs became cheaper and more plentiful. In 1921 the tendency appeared to be to keep the lighter breeds of ducks, such as the Indian Runner, the Khaki Campbell, and the Buff Orpington, for egg production rather than for table purposes, and much attention has been drawn to this aspect of duck-keeping owing to the laying competition for ducks conducted by the Great Eastern Railway Co. with the Utility Duck Club.

For many years the poultry industry received little recognition or assistance from the state authorities in the United Kingdom. Considerable changes in this respect, however, have been in evidence during recent years. State aid has been mainly directed to educational activities, and there are now few counties which do not possess an instructor in poultry-keeping, whose duties consist in giving instruction in this subject by means of peripatetic lectures, classes, and visits to poultry-keepers. Most of the agricultural colleges, dairy institutes and farm institutes also provide regular instruction in poultry-keeping to their pupils, and in some instances—such as at the Harper Adams Agricultural College, Shropshire; the Lancashire County Council School at Hutton; the Glasgow and West of Scotland Agricultural College Poultry School at Kilmarnock, etc.—courses of training are provided for students desiring to specialize in poultry-keeping.

Poultry-breeding centres have been established by the Board of Agriculture in co-operation with local authorities in almost every district in the United Kingdom, for the purpose of distributing good pure-bred utility poultry—usually by the sale of eggs for hatching or day-old chicks to smallholders, cottagers and allotment holders. This scheme has met with much appreciation and success. Table 6 shows the number of distributing stations established in England and Wales and the numbers of eggs and chicks distributed since 1919:—

TABLE 6.—Distribution Stations.

	Egg Stations	Egg & Chick Stations	Chick Stations	Incubating Stations	Total	Total Eggs	Distribution Chicks
1919	156		3	4	163	52,980	2,974

1921	138	84	9	4	259		

<sup>1</sup> Includes 24 stations which undertake distribution of ducks' eggs.

It is significant of the interest now taken by the State in the development of the poultry industry that the Ministry of Agriculture and Fisheries has created a separate Small Livestock Branch, on the staff of which technically qualified officers were appointed. One of the chief duties of the branch is to supervise the poultry educational work of local authorities in respect of which grants in aid are made by the Ministry. It is the duty of the technical head of the branch to advise the Ministry on matters relating to the industry.

Valuable work is done in Britain to assist the poultry industry by poultry societies and clubs, such as the National Utility Poultry Society, the Poultry Club, the Northern Utility Society, the Scientific Poultry Breeders' Association, the Midland Fur and Feather Federation, and many others. These clubs organize lectures, demonstrations, laying competitions and shows, and do a great amount of voluntary work in an advisory capacity. In 1920 a central organization known as the National Poultry Parliament was set up mainly through the efforts of Mr. Edward Brown, F.L.S., who was unanimously appointed the first president. This poultry parliament, which meets once or twice a year to discuss questions relating to the industry, is representative of societies, clubs, educational authorities and institutions and trading organizations. The parliament has appointed a smaller executive body known as the National Poultry Council, and one of the first important steps taken by the council was to set up a national examination board to conduct an examination and to award to successful candidates a national diploma, which is intended to be in the main a standard qualification for persons desiring to obtain appointments as instructors in poultry-keeping. (P. A. F.)

## UNITED STATES

Profound changes took place in the American industry between 1900 and 1920. In 1900 "breeding birds" and meat were the principal objects of poultry raising and furnished most of the profit. Eggs at that time were a by-product. Conditions had so changed by 1920 that eggs were the principal money producer and meat and breeding birds were the by-products.

Many factors contributed to this change. There had been a greater increase in the population especially in the cities, than in the number of hens kept. Consequently there was a greater demand for meat and eggs, especially eggs. Cold storage facilities and improved shipping methods had raised the average quality of the product marketed and by more nearly equalizing the supply and price, had increased the demand. The spring flow of eggs during the introduction of storage became profitable, although formerly it often had resulted in loss. The per capita consumption of eggs and poultry flock decreased because of the increase in price. The increase in price affected the consumption of meat more than of eggs because substitution of other meats was possible. Eggs, quickly and easily cooked, digestible, containing concentrated vitamins, clean, imparting their flavour and preserving qualities to cakes and pastries, remained in strong demand even at high prices.

During 1920 the total value of products placed the industry among the few of those connected with farming from which the 1920 return exceeded a thousand million dollars. The 1920 census showed more farmers reporting poultry than any other single crop, even apart from the large quantity of poultry raised in towns and villages not covered by the census reports.

Table 7 shows that, relatively, poultry-keeping rapidly declined in the east during the decade 1909-19. The west, especially the Pacific Coast states, continued to increase. The decline in the east was due largely to the high price of feed and the difficulty of obtaining it, particularly during 1917 and 1918, and the decrease in farm population and the number of farms. Opposite conditions obtained in the west. While feed was higher it was easily obtainable and relatively cheaper because of the freight congestion. During the decade there was an increase in the number of farms and farmers in the west particularly on the Pacific Coast. The poultry farms in New England that were making a specialty of producing meat were to a large extent put out of business owing to the increased cost of feed and labour without a proportionate increase in the price of meat during 1917 and 1918. The same was true to a lesser extent of the specialized egg farms and farm flocks in New England and the North Atlantic states. These farms had not returned to normal when the 1920 census was taken, but at the close of 1921 a rapid development was under way.

The general depression in the industry from 1916 to 1919 primarily affected those who were obtaining comparatively poor egg production due to faulty methods of management or to poorly selected or poorly bred stock. The poultrymen who obtained high egg yields made greater profits than for the years 1910-1915. This condition drew the attention of poultry-keepers to the necessity of getting a good egg yield and led to systematic breeding and selecting for egg production. Many farms, particularly those in the northwest, have bred their birds to the point where they are getting an average egg production of over 200 eggs per hen from large flocks of birds. From 1900 to 1915 an increasing number of commercial poultry farms were established primarily to produce eggs. These took the place of the broiler farms, which had been mainly failures. Through these farms and the value of the produce, poultry became a business or industry rather than a side-line for farmers' wives or a hobby for fanciers.

Perhaps the most rapid change that took place in the industry during the period 1910-20 was that in 1910 but few baby chicks were sold, but in 1921 millions were sold to the advantage of the breeder, the hatchery man and the farmer raising the chicks. If the rate of increase of the chick hatcheries for 1918-21 should be maintained until 1930 comparatively few hens then would be used for hatching, and comparatively few hatching eggs would be sold except to the hatcheries.

TABLE 7.—*Chickens on Farms in the United States, 1920 and 1910; and Eggs Produced and Chickens Raised, 1910 and 1909 by Geographic Divisions (from 14th Census Report).*

<sup>1</sup> The figures for both 1919 and 1909 include estimates for farms reporting chickens on hand but no eggs produced. The returns for 1909 included all eggs produced. To obtain figures for chicken eggs alone, deductions have been made for eggs produced by ducks, in proportion to the number of ducks on hand in 1910. Eggs from fowls other than chickens and ducks are considered negligible.

<sup>2</sup> The figures for both 1919 and 1909 include estimates for farms reporting chickens on hand on the census date but no chickens raised during the preceding year. The returns for 1909 included all kinds of fowls raised. To obtain figures for chickens alone, deductions have been made for fowls other than chickens, in proportion to the number of such fowls on hand in 1910.

<sup>3</sup> The products shown for 1919 include chicken eggs and chickens only, while the 1909 figures include the products of all kinds of poultry.

<sup>4</sup> Chickens 3 months old and over.

In 1900 there were few colleges or experiment stations in America teaching poultry raising or experimenting with it. By 1920 all the states were teaching and most of them were doing experimental work. Colleges and experiment stations have been of great assistance to farmers and poultrymen in showing them better methods. Egg-laying contests have shown the value of breeding for high production and of strains rather than breeds so far as egg production is concerned. The first egg-laying contest in America was at Storrs, Conn., under the supervision of the Connecticut Agricultural College in 1911-2. There were more than 10 contests in the United States and 10 in Canada in 1921-2. The highest average production in any contest was obtained by the Western Washington Experiment Station at Puyallup, Wash., for the year 1920-21. The 365 birds in the contest averaged 214 eggs per hen. The pen of five single-comb White Leghorns which led the contest and made the American record laid 1,384 eggs or an average of 276.8 eggs per hen.

During 1910-20 ornamental breeds and bantams so decreased that in 1921 few commercial breeds were maintained on a large scale. The chief breeds were White Leghorns, Barred Plymouth Rocks, Rhode Island Reds and White Wyandottes. There were also fairly large numbers of Anconas, Buff and White Orpingtons, Brown Leghorns, White Plymouth Rocks, Buff Wyandottes, Black Minorcas, Black Langshans and Light Brahmas.

Table 8 shows that imports and exports of eggs and egg products greatly increased from 1910 to 1920, the imports more

TABLE 8.—U.S. Exports and Imports; Eggs (Shell) and Egg Products, Fiscal Years 1910-20

	Exports	Imports
1910 . . .	\$ 1,264,043	\$ 166,859
1915 . . .	5,083,825	1,236,889
1920 . . .	19,459,187	9,250,021

rapidly than the exports, so that the United States seemed likely to become on balance an importing nation. The exports for 1920 consisted largely of shell eggs and went to Cuba, Canada, Mexico, Panama, England and Scotland. A considerable proportion of the eggs that went to Canada replaced Canadian eggs shipped to England. As Canada has a grading law, its eggs were exported to better advantage. The imports were mostly egg products from the Orient, particularly from China. In 1920 the imports consisted of 1,348,383 dozen of shell eggs, of which over 70% came from the Orient. The egg products amounted to 24,091,098 pounds, of which over 90% came from the Orient. Beginning about 1918 the large packing and egg handling houses began establishing egg-breaking and packing facilities in China and South America, so that in 1921 the imports seemed likely to continue to increase for some years unless tariff changes affected conditions. (O. B. K.)

**POWER, SIR WILLIAM TYRONE** (1810-1911), British soldier and administrator (see 22.224), died July 24, 1911.

**POYNTER, SIR EDWARD JOHN, BART.** (1836-1919), English painter (see 22.239), died in London July 26, 1919. In 1919 he retired from the presidency of the Royal Academy, and was created K.C.V.O.

**PREECE, SIR WILLIAM HENRY** (1834-1913), British electrical engineer, was born in Wales Feb. 15, 1834 and educated at King's College, London. He became a civil engineer but in 1853 joined the Electric and International Telegraph Co., whence in 1869 he reverted to the civil service. In 1877 he was appointed electrician to the Post Office, in 1899 engineer-in-chief and, after his retirement, consulting engineer. He was a pioneer of wireless telegraphy and his early experiments are described in 26.530. He died at Penrhos, Carnarvon, Nov. 6, 1913.

**PRESSENSÉ, FRANCIS DE** (1853-1914), French politician and man of letters, was born in Paris Sept. 30, 1853, the son of Edmond de Pressensé (see 22.299). He was educated at the Lycée Bonaparte, and at school had a brilliant career, earning many distinctions. He served on General Chanzy's staff during the war of 1870 and was taken prisoner at Le Mans, but after the war entered the public service. After a short period at the Ministry of Public Instruction, he entered the diplomatic service, and was appointed first secretary at Washington. In 1882 he

returned to France and took up journalism. He was a contributor to many journals, including the *Revue des Deux Mondes* and the *République Française*, and in 1888 became foreign editor of the *Temps*. On the rise of the Dreyfus question (1895) de Pressensé identified himself with the cause of the prisoner. He wrote in support of General Picquart, and in consequence of his advocacy of Emile Zola's cause was struck off the roll of the Legion of Honour. This led to his resignation from the *Temps*, and he came forward as a socialist politician, being in 1902 elected socialist deputy for the Rhone. He was prominent in the debates on the question of the separation of Church and State, and a bill brought in by him formed the basis of the one finally carried by M. Briand. He died in Paris Jan. 19, 1914.

De Pressensé published many articles of the greatest interest in the *Temps*, the *Revue des Deux Mondes*, *Aurore* and *Humanité*. He also produced *Le Cardinal Manning* (1896), an interesting study, and a work on Home Rule, *L'Irlande et l'Angleterre depuis l'acte d'union jusqu'à nos jours, 1800-1888* (1889).

**PRETORIA** (see 22.309).—Pop. (1911), whites 35,942, coloured 18,732, total 54,674; in 1918, whites 41,690. About a mile from the centre of the town on a commanding position on the slopes of Meintjes Kop are the Union Government Buildings, the finest public offices in South Africa. They were built 1910-3, from the designs of Herbert Baker, at a cost of £1,800,000, and consist of three main portions; a large central semi-circular colonnaded building flanked east and west by rectangular blocks. At the junction of each wing with the central section is a domed tower 180 ft. high, and at the end of each wing is a projecting pillared pavilion. A feature of the building is the long low roof, with projecting eaves. The space enclosed by the building is laid out in terraces culminating in an open amphitheatre, in the centre of which is a stone rostrum. The buildings are of South African freestone, on a foundation of Transvaal granite. The laying out and planting of the terraced gardens was not completed until 1920. The principal approach lies 12 ft. below the main terrace, is 80 ft. wide and is planted with trees. Another road leads to the suburb of Bryntirion, where are Government House and the residences of ministers.

The foundation stone of Government Buildings was laid in Nov. 1910 by the Duke of Connaught, and the first public ceremony in the amphitheatre of the building was held in 1915 to celebrate General Botha's conquest of South-West Africa. In 1913 a statue of President Kruger was unveiled in the town. In April 1918 Pretoria became the headquarters of the newly created university of South Africa. One of its constituent colleges, the Transvaal University College (incorporated 1910), is situated in Pretoria.

The State Library and Museum (built 1913) are in Market Street. The former Transvaal Government Buildings, facing Church Square, which is the business centre of the city, are used by the Provincial Council. The Law Courts (completed 1914) are on the north side of the square; the Post Office (completed 1912) faces Church Square and Church St.

The municipality, which owns the sanitary, water, electric and tramway services, spent between 1902 and 1919 a sum of £1,675,000 on improvements, including the provision of a water sewerage system, electric tramways, parks, an open air swimming-bath and a golf course, reputed one of the best in South Africa. The rateable value of Pretoria in 1918 was £7,438,000, its revenue £366,000, and its indebtedness £1,716,000.

**PRICES.**—In the following article, which should be read in connexion with those under COST OF LIVING and WAGES, the changes in prices of commodities during the years 1910-20 are considered with special reference to the United Kingdom. An account of the American system for controlling prices in the United States is appended.

(1) *Wholesale Prices in General.*—The movement of wholesale prices in general is measured by the method of index numbers. The prices of commodities for which definite market quotations for definite grades exist are selected as typical in their changes of prices in general, a year or longer period is chosen as base, the price of each commodity is equated to 100 at the base period and the price in other years expressed proportionately, such numbers being called price ratios. (Thus if the price of wheat in the base period was 60s. and in another year 45s., the price ratio in the latter year would be written as 75.) Then either factors are chosen expressing the relative importance of the commodities as deter-

mined by the total sum spent on them in a period or some other criterion, and each price ratio is multiplied by the corresponding factor, the sum of the products is divided by the sum of the factors and the resulting quotient is the index number of wholesale prices for that year; or the more important commodities are represented by two or more price quotations and the resulting price ratios are simply averaged to obtain the index number. There are many variants of method and there has been much controversy on every detail of the process; in fact, however, the precision of the result depends not to any great extent on the particular method followed, but principally on (i.) the number of independent prices included and (ii.) on the dispersion of the various price ratios in the year to which the index number refers, so that when prices are moving on the whole in the same proportion the index number is more accurate than when some are moving rapidly upwards and others are stationary or falling. In normal times when changes are moderate it has been shown both from theoretical considerations and by comparing the numbers obtained by various methods that the precision of the method is high, but during the war period the movements were rapid and unequal, the conditions of accuracy were lost and no very precise measurement could be obtained. The object of the method of index numbers is to average away the variations due to the special conditions of supply and demand of particular commodities, and to obtain a resultant which measures the effect on prices of general causes, such as the supply of currency.

It is found in practice that the necessity for restricting price quotations to those of commodities for which the same grade and quality is in the market in large quantities through a long period of years restricts the choice greatly, and limits it to raw materials or articles in an elementary state of manufacture. In some cases the price used is based on the average value of all grades of the commodities (e.g. of wheat, of tea, of coal), imported or exported, but this introduces a possibility of error since the average may change owing to a change in the relative quantities of high and low grades independently of any change in price. The three index numbers of wholesale prices in use in the United Kingdom are the Board of Trade's, the *Economist's*, and the *Statist's* (formerly Sauerbeck's); the first uses average values to some extent and applies factors to the price ratios to allow for the relative importance of commodities, the second and third use market quotations of definite qualities of goods and take a simple average of the price ratios.

Table I. exhibits the general movement in the twelve years before the World War, and shows how little the variation of method affects the result in this period. The year 1903 is taken as the starting point, since it is after the great fall of prices ending in 1896 and the subsequent rise and the inflation of 1900-1, and may be regarded as a normal year.

TABLE I.—Movement of wholesale prices in the United Kingdom 1903-13. (In each case the index number of 1913 is equated to 100.)

Year	Board of Trade Index No.	Sauerbeck's Index No.	<i>Economist</i> Index No.
1903	83	82	79
1904	84	83	81
1905	84	85	81
1906	87	91	88
1907	91	94	93
1908	89	86	83
1909	90	87	84
1910	94	92	90
1911	94	94	95
1912	99	100	108
1913	100	100	100
1914 Jan.-June	—	97	96

Sauerbeck's index numbers for 1903 on the same basis for separate groups of commodities were:—Vegetable food 90; animal food 85; sugar, tea, coffee 86; minerals 74; textiles 79; sundry materials 83. Wholesale prices had therefore been rising from 1902-13 (with a short inflation and depression in 1906-8), but tended downwards in the first half of 1914.

Average for year—

<i>Statist</i>	131	164	212	233	249	301	—
<i>Economist</i>	128	167	212	234	244	298	—
Board of Trade	127	164	214	235	261	327	—

Immediately after the declaration of war in 1914 prices began to rise, and with certain interruptions continued to mount up till the spring of 1920, when the index numbers reached their maximum (*Statist* 323, end of April; *Economist* 326, end of March; Board of Trade 357, average of July). Till Oct. 1917 the increases showed a remarkable regularity averaging 2% monthly, equivalent cumulatively to 27% per annum; on this scale the index in the successive Octobers would reach in 1914 106, in 1915 135, in 1916 171, in 1917 217 and in 1918 258, numbers which (except the last) are in close agreement with those shown in the table. This was, however, a definite seasonal movement superimposed on this regularity; in the first three or four months of each year prices moved up with special rapidity, while in the summer the increase was slackened and in some cases was replaced by a fall. The check in the increase in the summer of 1917, following a specially rapid rise, is attributable to the control of prices which by that date was general. From Aug. 1917 prices continued to rise in spite of control till Sept. 1918, but the rise in these 13 months aggregated to only 13% (239 against 213). After the Armistice prices fell slowly for five months, during the season in which in previous years the increase had been specially rapid, but expectations of a permanent fall were not realized; in the year beginning April 1919 the index rose from 224 to 323 or 44%.

From the beginning of the war till July 1919 the *Statist* and *Economist* index numbers are in close agreement, except that the *Economist* shows a more rapid rise for twelve months from Oct. 1916 and less increase in the late autumn of 1917, but there is disagreement as to the dates and amount of the increase after July 1919. At that date the three index numbers agree in estimating the whole increase in five years at 148, 149 or 150%. The following tables show the divergence in subsequent months:—

The earlier agreement is more remarkable than the later discrepancies, for the conditions of accuracy named above were not present during the war when prices were moving rapidly and quotations for the usual qualities of goods were often

The prices are of course measured in the currency of each country. In every case there is a fall in the last months of 1920.

unobtainable. It is important to emphasize this uncertainty, for it is the fact that exact measurements of general price changes cannot be made in times of disturbance, and indeed it is difficult even to define the quantity we wish to measure; tendencies can be observed clearly, but only rough measurements can be made and fine comparisons lead to error. The maximum level was reached in March 1920 by the *Economist* index number, in April by the *Statist*, in July by the Board of Trade. By Dec. 1920 the Board of Trade index was back at the level of the beginning of 1920, that of the *Statist* at the level of July 1919, and that of the *Economist* at the level of May 1919. The difference is mainly due to the varying proportions given to cereals and textiles, which had fallen rapidly, and to meat and minerals which had fallen little in the three numbers.

Table IV. (from the *Monthly Bulletin of Statistics of the Supreme Economic Council*, vol. ii., No. 5) shows the index numbers for several countries.

(II.) *Wholesale Prices of Selected Commodities*.—When we come to commodities separately, the measurements can be made more exactly subject to the two following qualifications. During the war period the ordinary sources of supply were so disturbed that pre-war kinds and qualities were no longer in the market (in the *Economist* index number only 19 out of the 44 quotations included were not subject to some modification of kind); and a statement of prices is generally taken as meaning the price at which a purchaser can obtain the goods he desires and at which a merchant is willing to sell, but in the time of control and rationing these conditions did not obtain, and the price was fixed by other conditions than those which influence a free market.

Table V. is based on the prices tabulated in the *Journal of the Royal Statistical Society*, July 1920, pp. 640-5, by the editor of the *Statist*. The index numbers have been recast, the average price in 1913 being taken as 100 for each commodity; the totals have been obtained by grouping together the separate entries on the same plan as in the original, but the change in base year affects the results, which thus differ from those given in Table II. in the same way as if the weights had been changed.

It is at once evident that the various prices have not followed the same course; the extremes in 1919 are tin, whose price rose only 28% in 6 years, and Russian flax, where the rise is 323%. This great divergence of itself shows that the general index number cannot have great precision; but in the absence of means of improving it, we cannot do better than take this number (shown in the line "Grand Total" in Table V.) as measuring the general inflation of wholesale prices.

The prices as recorded are the resultants of at least five nearly distinct forces, viz. the general inflation of prices, the conditions

of supply and demand for the separate commodities, the control of supply, the control of prices, the change of quality. In 1915

†These commodities are not included in the *Statist* index numbers.

‡Comparative values.

§Approximate prices. \*Nominal prices.

and 1916 the principal increases may be traced to the diminution or difficulty of supply (cereals, sugar, flax) or to acuteness of demand (wool) or to both (timber). In 1917-8 the prices of nearly all commodities whose supply was threatened or for which

the demand was increased were controlled. The quality was changed definitely in the case of flour and indirectly when the prices are averages of several grades as in the cases of meat, flax, leather and timber.

**Food.**—The price of wheat rose immediately after the beginning of the war, and with it the prices of flour, oats, maize and rice. The prices were checked by the establishment of a government system of purchase at the end of 1916 and by the control of the prices of home-grown cereals in 1917; with this system flour of mixed materials was substituted for wheat-flour and the product sold at a price kept constant and relatively low, by the help of a subsidy beginning in the autumn of 1917. In the case of wheat and flour the subsidy and control continued till the beginning of 1921 but the prices rose; the prices of other cereals increased very rapidly from the autumn of 1919. An attempt was made to control the consumption of oats in 1917-8, otherwise cereals were not rationed. The wholesale price of potatoes was fixed from time to time, the Government undertaking to make good growers' losses, but the price was changed so frequently that the control had little effect.

Early in the war the price of imported meat increased more rapidly than that of home-killed, till in 1917 there was little difference between their retail prices. On the whole the price of meat increased less than that of commodities in general. Prices were fixed in Aug. 1917 and consumption was rationed early in 1918; after the Armistice control was gradually relaxed; but prices of beef and mutton changed very little during the two years after the first fixing of them. The prices of Irish bacon quoted are hardly typical; in 1917 a great quantity of American bacon of inferior quality was bought by the Government, who had difficulty in selling it at a price which covered the cost. The demand for high-class bacon could not be met, and its price after 1917 rose more rapidly than that of butcher's meat. The line in the table relating to imported butter is perhaps misleading since the supply was insignificant, and its inclusion unduly depresses the average; for the records of milk and its products we must depend on retail prices. Taken together the prices of animal food increased at a lower rate than the general average of prices except in 1916-7.

The price of sugar was of course dominated by the cutting off of the continental supply, and its increase was greater than that of any commodity always obtainable included in the table. The Government took over the whole supply at the beginning of the war and issued it at a fixed price; the control continued till 1921. There was no shortage of supply of coffee nor of tea (except in the autumn of 1917), and their prices rose relatively little.

When all food prices are grouped together as in the table, it is seen that they rose till 1917 more rapidly than the average for materials, but that the increase from 1913 to 1918, and to 1919 was the same in the two groups.

**Materials.**—The prices of different kinds of coal increased at different rates prior to the general control of coal mines which took effect early in 1917; with the stoppage of export of coal the supply was adequate even for the increased use in the manufacture of pig-iron, and the restriction in consumption from 1917 was only necessary to economize labour in the mines. For domestic and manufacturing use the price rose but slowly till 1919 and generally less than for goods in general. Iron and steel began to come under control as early as June 1915 with the initiation of the Ministry of Munitions, and their use was severely restricted for all civil purposes, so that there was no free market for more than three years. The prices were actually fixed in Nov. 1917, a government subsidy being given to steel and to pig-iron makers to meet any extra costs. The subsidies were withdrawn early in 1919 and the price of pig-iron rose from £4 15s. to £8 a ton, the pre-war level having been £2 11s. Reconstruction and repairs, for many years in arrear, caused a great demand for iron and steel, and in July 1920 pig-iron was 320% and steel rails were 283% dearer than in 1914; prices fell slowly in the autumn of 1920 (Birkett: "Iron & Steel Trades during the War," *Statistical Journal*, May 1920). Copper, tin and lead showed no special inflation and were relatively cheap in 1919.

Cotton followed an exceptional course. With the cutting off of Germany from the market the price fell considerably in the first months of the war and was below the pre-war level till nearly the end of 1915. Presumably in consequence of the restriction of shipping, a rapid rise began in the autumn of 1916, and at the date of the Armistice cotton was at three times its pre-war price; then there was a perceptible fall for some months, but this was followed by a great increase, the reason of which has not been explained, which brought American cotton early in 1920 to more than four times its cost in July 1914; the reaction from this inflation gave the first indication in 1920 that the general index number was about to move downwards. Both yarn and piece goods rose more rapidly than raw cotton, especially in 1919-20.

The price of wool also fell after the outbreak of war, but the great demand for the Allied armies soon turned the scale and English wool especially became rapidly dearer in 1915. From June 1916 the Government took steps to assume ownership of all the wool it required and to control the rest; the distribution to manufacturers and prices was arranged by an intricate system involving the Government, wool-brokers and manufacturers (Zimmern: *Economic Journal*, March 1918). The price was very high in 1917-8 and rose rapidly in 1919 when the civilian demand for replenishing their wardrobes and households was acute, and the prices of yarn and manufactured goods outpaced even raw materials. There was no definite fall till 1920. As regards flax, the cutting off of the Russian supply and the Government demand for linen in airships caused linen to be practically unobtainable by civilians, and the shortage naturally continued long after the war. Jute and silk were less affected.

The variations in the movements shown under the heading "Miscellaneous" can in general be explained by known conditions of supply and demand. The supply of petroleum proved to be sufficient for war needs. The *Statist* index number is vitiated by the exclusion of rubber. Owing to the development of plantations before the war the supply was even excessive; the price was rarely more than 20% higher than in July 1914 and after the Armistice was lower.

(III.) *Retail Prices of Food in the United Kingdom.*—Accurate and useful statements of retail prices are in general only obtainable with respect to food, in part because most attention has been directed to recurrent and necessary domestic expenditure, in part because it is less easy to define the unit of purchase in the case of clothes and manufactured goods. The cost of other necessary items of expenditure is considered in the article *COST OF LIVING*, and this section deals with food alone.

The following tables show the average prices paid by the working classes in the United Kingdom, the result of the monthly collection of information by the Ministry of Labour (formerly by the Board of Trade) published in each issue of the *Labour*

*Gazette*, and described in detail in the issue of March 1920. The general movement in retail prices was similar to that of wholesale, that is, a nearly regular increase (23% cumulatively per annum) took place for three years after the outbreak of war, then for more than a year the rise was checked by control and rationing; there was a temporary fall in the spring of 1919, followed by a rise which became rapid in the summer and autumn of 1920 and a fall after Nov. 1920.

TABLE VII.—Average of Retail Food Price-Changes in the United Kingdom as computed in the *Labour Gazette*. (The average on the 1st or 2nd of each month is expressed as a percentage of the average in July 1914.)

\*Second quarter of 1914 taken as 100.

Table VII. shows the average of the movements as combined from the data in Table VI. (together with the prices of fish and eggs) by the Ministry of Labour, each item being given the importance estimated from a pre-war standard budget of expenditure. For the relation of this computation to the cost of living see *COST OF LIVING*. Except for making facile generalizations the detailed table is more important than the summary.

The price of bread rose intermittently, but on the whole rapidly till Sept. 1917, when its price was exactly double that of July 1914. The rate of extraction of flour from grain was controlled from the autumn of 1916, and government regulation flour containing an admixture of wheat, maize, rice and other cereals in varying proportions alone was used in the three years 1917-8-9, and during this period the price is not that of a commodity of constant quality. In Sept. 1917 the Government fixed the price at 9d. for the 4-lb. loaf, became the sole purchasers of the necessary cereals, regulated the price to millers and bakers and met the deficit by a subsidy. The price was raised to 9½d. in Sept. 1919 to meet bakers' increased expenses, and at subsequent dates again raised with the increasing price of wheat till it reached 1s. 4d.; when wheat fell in the latter part of 1920 the subsidy was gradually reduced to zero and the price of bread maintained; in 1921 the price fell, and was 1s. 1½d. from April to July. Flour followed nearly the same course as bread.

The retail prices of meat were determined by the wholesale prices already discussed. Imported meat remained for three and a half

\*The prices from Dec. 1914 to Dec. 1918 are calculated from the percentage changes recorded.

Notes.—The prices of meat are the means between two entries in each case and not the average prices of the carcasses. They should only be used for comparative purposes, and not taken to be the average price of all meat bought.

In general the records are the average for the commodities as bought in shops and stores used by the working class.

years at 2d. or 3d. a lb. lower than British meat, but since the price of the latter was nearly doubled, the percentage increase of the former was much greater. The Ministry of Food fixed wholesale prices and the retailer's margin in September 1917 and subsequently the distinction in price between British and imported meat was removed. Rationing was gradually introduced, and was nearly universal from April 1918 to May 1919. Purchasers were restricted also to the kind of meat that was available from time to time. During the period of control and till the summer of 1920 prices fluctuated little, but after control was removed imported meat became cheaper than British, and with a rise in the latter in 1920 the pre-war proportion between the two was nearly restored. Home meat was at its maximum (at about two and a half times its pre-war level) in the autumn of 1920 and did not fall at all considerably till after May 1921.

Prior to 1914 the corresponding numbers, for London only, are 1910 and 1911 98, 1912 and 1913 103. (See article COST OF LIVING for further analysis, and for comparative figures for other countries.)

The price of *bacon* rose rather more slowly in the opening years of the war, but rapidly in the summer of 1917 till it was 140% above the pre-war price. In Nov. 1917 importers' and dealers' prices were fixed, and in July 1918 the regulations extended to retail prices; during this period large supplies of generally inferior bacon were received from America, and rationing was only necessary for a few months. The price after being stationary for two years rose during 1920 till it reached three times the level of July 1914.

After 1915 the price of *milk* was markedly seasonal, while before the war it was generally retailed at the same price nearly all the year round. No change took place till the autumn of 1915, when the price rose 1d. a qt., and in the following autumn another 3d., and in neither case was there a fall in the spring; in the autumn of 1917 it reached nearly twice the pre-war price, and in subsequent years fell in the spring and rose in the winter to successively higher points, the maximum (10½d.) being reached in Jan. 1920. Maximum prices were in force from the autumn of 1917 till Jan. 1920, but they were not reached in all localities. The great rise in the price of milk must be attributed to the high cost of cattle food, which was very scarce in the period of restricted imports; elaborate arrangements were made to increase the supply by curtailing the consumption of cream and the manufacture of butter and cheese. Milk was not rationed except by informal local arrangements. Not much attention should be paid to the prices of *butter* and *cheese* after 1916, since during a long period they were not freely obtainable, and the Government having taken control distributed them at prices which would meet their cost. Butter was rationed with margarine.

The price of *margarine* rose little till 1917, while its consumption increased greatly owing to the want of butter. A shortage of supply was felt suddenly at Christmas 1917, and the Ministry of Food took control and presently assumed ownership of the supply of its constituents and the factories in which it was made. The quality was greatly improved, as compared with that in 1914, and its importance as food became very great in view of the difficulty of obtaining sufficient fatty substances from other sources. The price was fixed in Nov. 1917 at 1s. (1s. 4d. for oleomargarine) and changed little till the end of 1920. In May 1919 the price was left free.

The whole supply and distribution of *sugar* was taken over by the Government at the beginning of the war and control was continued till 1921. Sugar was distributed through the ordinary channels in such amounts as were available and traders began early to ration their customers. Official rationing (generally at 8 oz. per person) developed in 1917 and its success encouraged the Government to develop the general scheme of rationing meat, fats and some other foods in 1918; rationing of sugar gradually became obsolescent in 1919. The price rose considerably at irregular intervals as shown in the table till in Jan. 1920 it was seven times as dear as before the war.

*Potatoes* became dear after 1916 and afterwards fluctuated strongly upwards in sympathy with other agricultural produce and the price of manures, and in relation to the supply of each season. The high prices, however, were not universally felt owing to the development of the cultivation of private allotments especially early in 1918.

The supply of *tea* was ample except for a short period in the autumn of 1917. At that date the Government took control of the supplies and provided a uniform blend to be retailed at 2s. 8d. per lb. The rise in price was less on the whole than that of any other commodity shown in the table.

Other less important foods often showed a greater increase in price than those already named, especially since there was a run on them during the time of restriction and shipping facilities were given rather to the more necessary imports. Eggs in particular became scarce and dear owing to the failure of the European supply and the scarcity of poultry food.

No general comparison of wholesale and retail prices is possible, for want of adequate records of the wholesale prices of manufactured goods and of retail prices of articles other than food. In the case of food, however, the figures are sufficiently typical and accurate to allow of a general comparison, but not to permit accurate detailed measurements. The two index numbers shown depend on nearly the same range of foods, but the bread subsidy lowers the retail prices by about 10 points in 1918-20.

TABLE VIII. Wholesale and retail prices of food. (Statist and Labour Gazette index numbers.)

Year	Quarters	Wholesale (Statist)	Retail (Labour Gazette)
1914	1st & 2nd*	100	100

1921	1st	246	250

\*July 1914 for retail prices.

In Table VIII. the retail prices for the first quarter of each year are the averages for the 1st of Feb., March, April and so throughout the year. Wholesale and retail prices include those of controlled goods, and in the case of wheat, flour and bread are affected by the bread subsidy. The table shows that retail prices rose in sympathy with wholesale prices during the first three years of the war, but the rise on the whole was less, and the accelerated rise in the spring of each year was only marked in wholesale prices. As prices became more and more rigidly controlled in 1917, and some commodities were rationed in 1918, wholesale prices fell or remained nearly stationary, while retail prices rose very slowly.

(A. L. Bo.)

**PRICE-CONTROL IN UNITED STATES.**—During the World War price-fixing agencies in the United States were numerous, and the arrangements made were often informal. Many prices were controlled indirectly; but when this control was to any degree international the result was a "fixed price."

Prices were more or less formally fixed by various departments or branches of the U.S. Government for at least 110 important products, each of which required a separate price-fixing operation. This was exclusive of repetitions or renewals at later periods, which often involved as much work and study as the original decisions. The following is a partial list of products for which prices were fixed by some government agency or sanction. They are arranged in general in the order in which the prices were fixed, although no pretence to accuracy in this regard is claimed. Food products are not covered in detail, and no attempt has been made to mention them in order:—

Hides	Castor oil	Copper, ingot, electro-
Coal, bituminous	Aluminium	lytic
Coal, semi-bituminous	Coal, anthracite	Copper wire
Pig iron	Coke	Iron ore
Steel plates	Copper	Nitric acid
Steel, structural	Molasses (imported)	Cotton linters
Wheat	Manila fibre	Cotton goods
Ship timbers	Retail lumber	Cotton yarns
Pine, yellow	(eastern cities)	Denims (Mass.)
Steel billets	Platinum	Drillings (Mass.)
Sugar	Hemlock	Ginghams, (Amoskeag)
Sardines	Pine, white	Print cloths
Bar iron	Spruce, eastern	Sheetings, bleached
Pipe, cast-iron	Paper, newsprint	Sheetings, brown
	Manganese ore	Hemp

Steel rails	Sashes and doors	Tickings (Amoskeag)
Nickel	Linters (munition)	Flour, wheat
Tin plate	Quebracho extract	Rice
Wire, barbed,	Cement, Portland	Building tile
galvanized	Sulphur	Crushed stone
Wire, plain,	Rubber	Sand and gravel
annealed	Wool	Lead
Ammonia	Acetate of lime	Charcoal
Douglas fir	Quicksilver	Leather, sole
Arsenic	Iridium	Glycerine (dynamite)
Ammonium	Hogs	Cottonseed meal
sulphate	Leather, harness	Cottonseed oil
Alcohol, wood	Prunes, California	Wool grease
Acetic acid	Raisins, California	Burlap
Nitrate of soda	Carbon tetrachloride	Tin, pig
Silver	Formaldehyde	Tree nails, locust
Zinc, grade "A"	Chlorine gas, liquid	Cotton compress rates
Zinc, sheets and	Toluol	Birch logs
plates	Phenol	Brick, common
Binder twine	Picric acid	Wallboard
Castor beans	Sulphuric acid	Food products

Without attempting a complete list, it may be stated that food products whose prices were regulated included flour, bread, sugar, live stock, meat, poultry, dairy products (including retail milk prices), oleomargarine, cottonseed and its products, canned foods, dried foods, rice and rice flour, feeds and coffee. The prices that were first formally fixed by the Government fall chiefly in the basic raw-materials group. A more shortsighted policy might have begun by regulating prices of articles which figure most conspicuously in public consumption.

In some cases prices were fixed for Government purchases alone, for example, nickel, quicksilver, sulphuric acid, cement, New England spruce and other lumber. In others the prices were fixed for the Government and made available to the public in a contingent way; for example, in the case of hemlock lumber it was provided that any quantity of the commodity which, in the judgment of the lumber director of the War Industries Board, could be released for the commercial market might be sold to the public, subject to the maximum price fixed for the Government. In still other cases—for example, copper and raw sugar—purchases by the Allied Governments were included in the scope of price-fixing for the U.S. Government; and in a few instances, as purchases for the use of the railways of the United States, the prices were specifically fixed, although they did not apply to the public. Prices were sometimes fixed for single branches of the Government, as in the case of oil products for the navy and cow-hide splits for the quartermaster's corps of the army. Prices were even fixed by the U.S. Government to apply to purchases by the Allied Governments only, as was the case with fuel oil, gasoline and kerosene.

The President, however, early took a firm stand for the principle that prices charged by producers should be the same to the public and to the Government, and, with the exception of prices on certain purchases made by Government departments, rapid progress was made during 1918 in carrying out this policy. Thus the prices fixed for pine, fir lumber and cement, which at first applied only to direct Government purchases, were extended to the public. It proved to be highly important as a practical matter that prices under similar conditions of purchase should be the same to all. The existence in the commercial market of prices that were higher than those paid for Government purchases made it difficult for the Government to secure prompt deliveries. Moreover, such a situation often defeated the purpose of price-fixing, because large purchases might be made by private concerns producing more or less directly for the Government.

The period of price-fixing began about the middle of 1917, and came to a nearly complete standstill with the signing of the Armistice. Among the earliest commodities to be affected by the price-fixing activities of the Government were lumber, coal, wheat, sugar and canned foods. Lumber prices for the Government alone were fixed by arrangement with the Council of National Defense on June 18 1917, and approved by the Secretary of War; coal prices for the navy were fixed on June 19 1917. The Food and Fuel Control Act on Aug. 10 1917 set a minimum price on the wheat crop of 1918. Bituminous coal prices at the mine were fixed by executive order on Aug. 21 1917. Nine days

later came the President's announcement of a \$2.20 basic price on wheat "to be paid in Government purchases." The price of copper was fixed in September. Relatively few prices were fixed after Nov. 1918, although those fixed prior to that time extended well over into 1919. Prices, as fixed, were allowed to expire in spite of the fact that in several important cases the representatives of the industry concerned asked that the existing price be continued. On Dec. 11 1918 the War Industries Board issued a statement to the effect that, since it would cease to function after Jan. 1 1919, no new price agreements would be entered into by the Price-Fixing Committee and that all prices theretofore fixed would be allowed to expire by limitation. Several commodities, the cost of which had not been immediately ascertainable, had been taken in large quantities by the Government at prices subject to later determination. For example, during the latter part of Jan. and the early part of Feb. 1919, the Price-Fixing Committee of the War Industries Board fixed prices on common brick and on wall board. Inasmuch as the Food and Fuel Administrations depended for their powers upon the Act of Aug. 10 1917, which applied "during the war," they functioned longer, but became practically inoperative early in 1919.

Of the various agencies through which prices were fixed the following are without doubt the most important: Congress, which by direct legislation fixed a minimum price for wheat and for silver; the President, acting under authority granted by Congress, who fixed prices for coal and wheat; the War Industries Board, created by the President July 28 1917, under authority from Congress, which Board through its Price-Fixing Committee fixed numerous prices from Sept. 1917 to Nov. 1918 (as late as Jan. and Feb. 1919 several cases of price-fixing for commodities bought at tentative prices were awaiting cost determination); the U.S. Food Administration, established in Aug. 1917, which fixed prices of hogs, meat, flour, sugar, binder twine, etc.; local food administrators and sub-agencies, such as the Sugar Equalization Board and the U.S. Food Administration Grain Corporation, which fixed many prices; the U.S. Fuel Administration, established in Sept. 1917, which fixed prices of coal, coke, etc.; the War Trade Board, which fixed prices of rubber, quebracho extract and manila fibre; the Federal Trade Commission, which fixed the prices of newsprint paper; the Emergency Fleet Corporation of the U.S. Shipping Board, which fixed the price of ship timbers and locust tree nails; the U.S. Shipping Board which fixed ocean freight rates; the International Nitrate Executive Committee, which fixed the price of nitrate of soda; the Food Purchase Board, which fixed prices of canned foods, etc., for the army and navy; various army and navy departments, which fixed prices of gasoline and fuel oil, zinc oxide, automatic sprinklers, sashes and doors, castor oil, etc.; the Appraisal Boards of the army and navy, which fixed prices in cases of dissent from prices named in commandeering orders; and the U.S. Railroad Administration, which took steps to fix reasonable prices of locomotives and cars. As time went on a tendency toward greater uniformity and centralization of procedure developed within the price-fixing mechanism. This tendency was seen in an increasing amount of work thrown upon the War Industries Board and the Federal Trade Commission, the former naming a price based largely upon the cost findings of the latter.

In initiating price-fixing no systematic plan was followed and prices were at first fixed sporadically. Various Governmental powers were resorted to and were applied by numerous agencies, using diverse means for carrying out the decisions or agreements which they reached. In some cases prices were fixed under special authority, conferred directly by Act of Congress, and limited by the provision of such Act to specified commodities. Thus by section 14 of the Act of Congress of Aug. 10 1917, already referred to, the President was empowered to fix "a reasonable guaranteeing price for wheat." Accordingly on Aug. 30 the President, acting upon the recommendation of a committee appointed by himself, promulgated a price of \$2.20 per bush. for No. 1 northern spring wheat at Chicago. The same law, commonly known as the Lever Act, authorized and empowered the President to license importers, producers or distributors of "any necessities, in order to carry into effect any of the purposes of this Act"; and, if he found unreasonable any storage charges, commissions or profits, to revoke licences and make findings as to reasonable profits, etc. Section 19 of the Act authorized him to requisition necessary foods, feeds, fuels and other supplies. Section 11 gave him

power to purchase and sell at reasonable cash prices wheat, flour, meal, beans and potatoes. The power under this Act ran to the President, and the Fuel Administrator and Food Administrator acted under "executive orders." On the other hand, the War Industries Board acted under less specific authority proceeding from the general war powers of the President. Thus the prices fixed for steel, copper, lumber and other commodities by the Price-Fixing Committee of the War Industries Board were in theory approved by the President before being publicly announced. In some cases, however, such as retail lumber prices in certain eastern cities, the prices were announced without formal approval by the President.

The means of enforcing prices when "fixed," whether determined by the price-fixing agencies or reached by agreement with the producers, were various, ranging from appeals to the patriotism of the trade to commanding orders. In most cases there was in the background the possibility of the Government's taking over the industry; and in not a few the army or navy did commandeer plants or stocks of merchandise. In such cases a price was named which was subject to adjudication, first by the Board of Appraisers and, then, upon appeal, by the courts. On Dec. 24 1917 all wood chemicals (acetic acid, alcohol, etc.) were commandeered for a period of six months and later the commandeering order was extended to cover the second half of 1918. Apart from purchases on army or navy account, however, price-fixing was effected chiefly by "licences" and control of "priorities." The Food Administration and the Fuel Administration, under the Act of Aug. 10 1917, put in force extensive systems of licensing, under which unlicensed producers and distributors were not allowed to engage in business, and licences were revoked, if the regulations were disobeyed. The War Trade Board also licensed importers of certain articles on condition that the prices which it fixed should be observed. The administration of priorities proved to be a major element in the price-fixing programme, and involved many important questions. Toward the end of 1917 a priorities division was established within the War Industries Board and a priorities commissioner placed at its head. Representatives of the Fuel Administration, the Railroad Administration and the U.S. Shipping Board were placed upon a Priorities Committee. The War Trade Board, the Food Administration, and the army and navy were also represented. The Price-Fixing Committee of the War Industries Board and the Priorities Committee worked in harmony. This was of the utmost importance, as it made possible a substantial degree of unity of policy among the different Government purchasing departments; and, through the power of the Priorities Committee over fuel and transportation, pressure could be brought to bear upon a recalcitrant business concern for the purpose of compelling it to adhere to fixed prices. The Priorities Committee undertook whenever necessary to administer priorities in the production of all raw materials and finished products, save food, feeds and fuels. The distribution of fuel was, of course, under the supervision of the Fuel Administrator, and transportation service under the U.S. Railroad Administration, but the Fuel and Railroad Administrators were guided largely by the "preference list" issued by the Priorities Committee and by the recommendations of the division chiefs of the War Industries Board, and on the whole came to work in close relation to the committee's general policy. The Priorities Committee, then, exercised a general function of adjusting production to the needs of the nation at war by allocating the limited supplies of fuel and basic raw materials, and its powers were sometimes used as a club to reinforce the authority of the Price-Fixing Committee in particular cases. The Army and Navy Appraisal Boards were called to pass on prices in the case of commander orders issued for the requirements of those departments. When a commander order was to be issued the practice developed of having the chief in charge of that division of the War Industries Board which dealt with that commodity approve the order in which the price was named. If, as was frequently the case, the producers of the commodity were not satisfied with the price, the matter was brought before the Appraisal Board. It is important to observe that those members of the Price-Fixing Committee who represented the army and navy were also members of the appraisal boards of these two departments.

Various methods of applying price control were tried. Prices may be fixed both directly and indirectly. As a rule, each commodity the price of which it was desired to fix was taken up directly and a specific price made for its purchase; but in some cases reliance was placed upon indirect control of the price of one commodity through direct control of the price of another. A most interesting and important phase of indirect price-fixing activities lay in the attempts to restrain prices by controlling consumption, as in the cases of tin, platinum, coal, sugar, wheat and meat. These efforts culminated in rationing in the case of sugar and the requirement of purchase of substitutes in the case of wheat or flour. Steps were taken, also, to prevent waste and to improve methods of production, for example, cleaner threshing of wheat. Most of such "conservation" measures are to be approved without reserve. Closely connected with the conservation phase as seen in control of demand, rationing, etc., were stabilization and pooling. But pooling, while partly used to facilitate rationing (as in the case of sugar), may also be used to keep prices up, either locally or throughout the entire market. In at least three cases, wheat, sugar and tin, the Government entered upon a pool-

ing programme for the purpose of stabilizing prices. Stabilization is a term which implies mixed motives, a considerable part of its purpose commonly being to maintain or keep up prices, at least in a part of the field. This was the case with the Sugar Equalization Board and the tin pool, and the Government's Grain Corporation.

The degree of precision with which prices were fixed varied widely from commodity to commodity, ranging from a loosely determined maximum price to a careful determination of the definite price to be charged for a particular commodity in the case of a particular purchase. As a rule, only maximum prices were fixed, although in a majority of cases the price named as a maximum was the one which actually prevailed. This was not infrequently taken for granted by the price-fixing agency. In some important cases, however, the actual market price fell below the maximum named by the Government. This was true of zinc plates and sheets and certain kinds of lumber. Also, in the case of rubber, a price was named by the War Trade Board as a maximum, which was considerably higher than the market price. As has been already noted, a minimum price was fixed for wheat, the reason being that it was desired to guarantee the market in this case and thus encourage production. The price of hogs was fixed on the basis of a positive minimum after the failure of the attempt to maintain the price on the basis of a fixed ratio to corn. Wheat also furnishes a case in which both a maximum and a minimum price were specifically fixed. Obviously a result similar to that obtained by naming a price may be gained by limiting profits or gross margins. Thus, an effort was made to restrict the profits of the meat-packers to 2½% on sales, and in the case of the five largest packers a maximum margin on meat of 9% on investment was named. The flour millers were limited to a profit of 25 cents per barrel. Dealers in cotton-seed and peanuts, both ginners and others, were limited, beginning July 1 1918, to a margin of \$3.00 per ton over cost (not replacement value). This method was also largely used by the Fuel Administration in an attempt to regulate the price of coal to consumers, and in Sept. 1917 this agency announced its plan for fixing the maximum gross margins of retail dealers in coal and coke. Each dealer was authorized to add to the average margin for 1915 between his delivered cost price of coal or coke and the price charged consumers, 30% to cover increased expenses provided the gross margin thus arrived at did not exceed his average for July 1917. Fixed rates of commission or margins of profit were imposed also on dealers in newsprint paper, retail lumber and other commodities.

In addition to the above methods, there was the attempt to fix retail prices directly by publishing fair prices, as was done for groceries by the local "price interpreting boards" set up by the Food Administration. Price-fixing by restricting margins passed into the realm of hopes and aspirations in such cases as the earlier regulation of the lake-forwarders by the Fuel Administration, and the cotton-ginners by the Food Administration, for in these cases the producers were merely urged to charge "reasonable" prices. Much the same may be said of the somewhat tentative moves made by the Oil Division of the Fuel Administration toward fixing the price of petroleum and its products. In July 1918 the Oil Director made some proposals with regard to fixing the differential between the prices of crude and those of refined products; and in Aug. he announced a plan to stabilize the price of crude oil, stating his belief that this would prevent radical changes in the price of refined products. It does not appear, however, that the plan had any appreciable effect.

From the foregoing it would appear that there were three chief types of price-fixing:—(1) *maximum prices*, in the case of basic staples which had wide public interest, often recognized as "pegged" prices when any scarcity or rapidly advancing cost existed; (2) *definite prices*, (a) to encourage production by guaranteeing returns, (b) Government purchases (direct or indirect) in the nature of single transactions; (3) *margins*, (a) absolute amount per unit, (b) percentage on sales, cost, or investment; this method being used when it was desired to cover the distribution of products, the marketing of which was not integrated with manufacture. The minimum price, strictly speaking, was the exception, but is logically associated with the definite price, which is both maximum and minimum.

Another distinction of some importance in fixing prices depended upon the place at which the price named was to apply. Some prices were made on an f.o.b. factory basis, while others were on a delivered basis. The practice prevailing in the industry was partly followed. The tendency, however, was to fix prices on an f.o.b. factory or mill basis, a natural tendency when the price is based on cost. In a majority of cases, prices came to be made f.o.b. the producer's plant. In many cases, however, prices were quoted f.o.b. some market basing point. This was notably true of copper, which was always quoted f.o.b. New York, although the metal was secured from mines in Michigan, Montana and Arizona, and refined at various seaboard points. In the case of commodities produced in several competing areas there was often a tendency to quote prices on a delivered basis. Prices delivered were fixed for New England spruce,

Pennsylvania hemlock, cement, hollow building tile, iron and steel scrap, and oil products for the navy. The situation in the case of hollow building tile furnishes some explanation of this tendency. The chief producing area for this commodity was centred in Ohio, while there were other producing territories in the south, in New Jersey and elsewhere. In order to stabilize market conditions and to divide the market, the representatives of the industry desired to fix prices on a delivered basis. In this way, by fixing a delivered price sufficiently low, the low-cost producers in Ohio were prevented from coming too far east with their product; while, if the price had been fixed f.o.b. the plant, there would have been no limit to the area covered by the low-cost producer, except cost of freight and desire for profit. Had the war continued much longer, there can be little doubt that adjustments in railway rates would have become an important part of the price-fixing programme. Special railway service was given in a number of instances as a direct part of price-fixing, as, for example, the arrangements made to furnish transportation to the Douglas fir lumber mills for the purpose of relieving them of accumulations of low-grade lumber. In the case of price-fixing for manganese ore produced in the United States, an integral part of the scheme was the application of special railway rates.

When a controlling part of the supply of any given product is produced by concerns which are not completely integrated, especially as to the earlier stages of the industry, it is practically necessary, in price-fixing, to control the price of the chief semi-finished products; but when a controlling proportion of a product comes from producers who are more or less completely integrated, this necessity does not exist, although some protection may be required for independent producers in the earlier stages. Also when the object is to protect the consumer of products which are distributed by separate wholesale and retail agencies, it is necessary to control the wholesale and retail prices as well as the price f.o.b. factory or mill.

Prices were fixed for various periods of time, but in general it may be said that on account of changing conditions the periods were short. Perhaps the period most frequently chosen was three months. A much shorter period would have created too much risk and uncertainty in marketing, to say nothing of the strain upon the price-fixing machinery; while a longer period was not, as a rule, desired by the representatives of the industries, especially during a period of increasing costs. Various exceptions might be cited, such as the case of wheat, in which the price was fixed for the crop of a given season. The prices

of meat and coal were fixed for indefinite periods, and the same was true of manganese ore. Various bases for determining the reasonable maximum price to be fixed were used, but it may be said that, on the whole, the prevailing tendency was to fix prices on the basis of cost, a reasonable allowance being added for profits. In this connexion the Federal Trade Commission did important work in ascertaining from the books of the producers the actual cost of production and the investment.

In the ordinary case of price-fixing, the gist of the method used by the Price-Fixing Committee was as follows:—First, some estimate was made of the probable quantity of the product wanted, which, of course, involved a knowledge of the stocks on hand. Second, the quantity which each producer could turn out was ascertained. Third, each producer's cost of production was computed for the most recent period available. Fourth, the average investment involved in the production of the commodity was determined and reduced to the basis of investment per unit of product. The first three of these items bear directly upon the determination of the representative or marginal producers for price-fixing purposes. The fundamental question in fixing prices that are based on cost, is the determination of what may be called the "marginal cost." This cost may be explained as follows: it is frequently the case that when the several individual costs for a group of producers are accurately ascertained and are ranged in their order from low to high, there will be a variation among them of 100%, the high cost being double that of the low cost. Ordinarily the bulk of the production comes from those producers whose costs are below the average, though this is not always the case. It does not follow, however, that the average cost gives the basis for a fair price. If 25%, or even 10%, of the production comes from high-cost producers and the entire output is needed, the average cost cannot be the basis of price. It is true that in many cases prices were fixed on the basis of average cost, both by the War Industries Board and by other price-fixing agencies; but as time went on methods were perfected, and the practice of taking a "representative cost" developed. This representative cost was very similar to what the economist calls the marginal cost, meaning the cost at which the highest-cost producer is able to produce without loss at a given price.

Of the conditions which facilitate the determination of a reasonable marginal cost for price-fixing, a knowledge of the requirements of the market, or in war-time a knowledge of the needs of the Government and its agencies, is most important. Price-fixing in the United States was handicapped by uncertainty as to the quantity which it

Yearly and Quarterly U.S. Fixed Prices, 1913-8.

was desired to have produced, which uncertainty was in some cases due both to ignorance of the available stocks and to uncertainty as to future requirements. While prices were generally fixed on the basis of cost, there were necessarily many exceptions. Sometimes no costs were available. Sometimes cost was only partly available as a basis, as in the case of "joint products" and of products for which complete cost data did not exist. Sometimes, again, no effort was made to use cost, as in the case of substitutes whose prices were fixed on the basis of the commodity in the place of which they might be used. In a few instances the price was fixed without regard to cost, merely on the basis of preëxisting prices, such prices being taken for what was presumably a normal period. Perhaps the chief difficulty in most cases was to ascertain a fair return on investment. This phase of the matter was never satisfactorily dealt with by any U.S. price-fixing agency during the war. The Federal Trade Commission in connexion with its cost findings frequently reported to the Price-Fixing Committee of the War Industries Board a figure representing the investment, but time did not permit the careful investigation that would have been necessary to ascertain the actual money invested, nor was the attitude of the price-fixing agency, as a rule, one which favoured the strict construction of "investment." In general, it may be said that in a majority of the price-fixing operations of the War Industries Board, some consideration was given to the estimated investment, and that in such cases the figure used was one which lay somewhere between the book value claimed by the companies concerned and the actual net investment made. On the other hand, a majority of the price-fixing operations of such agencies as the Food Administration appear to have been made on the basis of a margin (interest and profits) per unit of product, determined upon with reference to past experience. And of course, exceptions to any usual practice were at times necessary.

In general there were three chief purposes in fixing prices: (1) to secure production of needed commodities; (2) to prevent social unrest by checking profiteering, coordinating food prices and wages, and stabilizing industrial conditions; (3) to assure Government economy of purchase. The greatest success was attained with regard to the first purpose. The accomplishment of the second, which was more vague, is difficult to measure, but appears considerable. The most that can be said concerning the third is that things might have been worse had there been no price-fixing.

The table on page 148 shows the yearly and quarterly average prices of important articles whose prices were regulated.

On the whole, it may be said that price-fixing in the United States suffered from the lack of a programme. No adequate study was made of interrelations between commodities or of the various complicated factors affecting demand and supply. No general principles were formulated. Too frequently, each step was taken up as a separate proposition. Much trouble would have been saved by a better understanding among the different price-fixing agencies and by the adoption of certain broad fundamental principles, such as the basis for determining marginal cost and the basis for determining investment. There should have been a general board of strategy to supervise the entire price-fixing programme and to coordinate it with the Government's fiscal arrangements and with the various steps taken to control the production and consumption through priorities and rationing. Some progress was made in this direction, but it remains true that the price-fixing operations were not sufficiently correlated with taxation and borrowing (inflation) on the one hand, and with rationing and priorities on the other. (L. H. H.)

**PRINCE EDWARD ISLAND** (see 22,344).—The pop. of this Canadian province in 1911 was 93,728, having sunk from 109,078 in 1891. It is the most densely populated province in Canada, with 42.92 persons to the square mile. In 1911 the origin of the people was: Scots 36,772; English 22,176; Irish 19,900; French 13,117; all other nationalities 1,763. Charlottetown, the capital (pop. 11,198 in 1911), standing on one of the best harbours in America, is celebrated as the birthplace of the Canadian Confederation, the first conferences having been held there in 1864.

The Legislative Assembly is composed of 15 councillors elected on a property qualification, and 15 members elected on a popular franchise. The Executive Government consists of nine members.

The superintendent of education acts as secretary to the board and administers the system through school inspectors. In 1920 there were 468 schools; 597 teachers, and a total enrolment of 17,861 pupils; the expenditure was \$268,547 in 1919.

Prince Edward Island has been aptly described as the garden province of the Dominion, more resembling an English shire than a Canadian province. The population is almost entirely agricultural, and practically the whole island has been cleared and brought under cultivation. The soil of the island is best suited for oats and potatoes, which are the staple crops. Wheat is grown for local purposes only. Maize, for fodder, and barley are grown. Cattle and hogs flourish. The total value of field crops in 1920 was \$18,530,400. Poultry-raising and dairying are extensively and profitably carried on. Beef and bacon, as well as fruit, poultry, butter, cheese, eggs and potatoes, are exported in large quantities to neighbouring provinces, Newfoundland and the New England states. Cooperative dairying was begun in 1891 and the growth of the industry has been rapid. A new source of revenue began in 1910 with the breeding of black foxes and the industry of fur-farming was developed. About \$10,000,000 had already been invested in this industry in 1918, in which year the sale of fox pelts realized over \$750,000. In 1919 300 fur ranches sold skins and live animals to the value of \$1,500,000, and in 1920 there were approximately 11,000 pairs of black foxes on the ranches of the island.

The once celebrated Malpeque oyster has almost become extinct through disease. The lobster industry is also on the decline. The value of the fisheries in 1919 was \$1,536,844, the catch including cod, herring, mackerel, oysters and lobsters. The men employed in the industry numbered about 6,000.

No mining is carried on. Manufacturing is connected chiefly with the preparation of foods such as butter and cheese. Pork-packing and lobster-canning are large and growing industries. The value of manufactured products was \$3,136,470 in 1911.

The strait of Northumberland separates Prince Edward Island from the mainland, the distance across varying from 9 to 31 miles. At the narrowest point a railway-car ferry established in 1918 by the Dominion Government connects the Canadian National railway system of the mainland with that on Prince Edward Island, and affords continuous connexion summer and winter across the strait. This is the principal highway of transportation to and from the island province, but the ferry service is occasionally interrupted by ice and the substitution of a tunnel has been advocated. (W. L. G.\*)

**PRINCETON UNIVERSITY** (see 22,347).—In Sept. 1910 President Wilson accepted the Democratic nomination for governor of New Jersey and resigned the presidency of the university. In Jan. 1912 Prof. John Grier Hibben, of the faculty, was elected president. His administration was marked by further development of student self-government, the conducting of discipline and general student activities and the regulation of athletics being in 1921 shared by undergraduate representatives and university officers. Especial attention was paid to the scientific safeguarding of student health and physical fitness by careful periodical examinations and required supervised athletics. The potential effectiveness of the alumni organization was increased by the formation of a National Alumni Association, whose working administrative centre was the Graduate Council of about 100, representing the graduate classes, the alumni associations, and different regional districts of the country. The national character of the university was expressly recognized by the addition of regional trustees to the governing board, and also by the establishment of a large number of regional competitive scholarships.

On the scholastic side, the entrance requirements and the undergraduate curriculum were completely revised. To put the university into closer touch with American secondary education, especially the high schools, Greek was no longer required (although strongly advised) for the A.B. degree. The Litt.B. degree was discontinued. The elective principle was broadened so as to bridge the gaps between preparatory school and college, and underclass and upper-class years, giving the student in his underclass years a broad general training in subjects deemed fundamental to real education, and in his upperclass years requiring him to follow continuous work in one of three divisions of studies, the literary-philosophical, the historical-economic, or the mathematical-scientific. The regulations governing admission to the graduate school, and in particular to candidacy for the competitive fellowships, the awards of which depend entirely on scholarship and ability, attracted to the school an increasing number of select advanced students in liberal studies. The erection of the residential graduate college in 1913 rendered permanent what had previously been an experimental and, in America, an unique feature of the Princeton graduate school, namely, the provision of adequate living quarters for graduate students, who there shared a common scholarly life amid attractive conditions. The graduate college accommodated in 1921 about 100 students.

During the World War over 5,000 undergraduates and graduates were in Service; about 3,000 receiving commissions, and 284 receiving 293 decorations and citations. The honour roll of those who gave

up their lives numbered 149. The entrance atrium of Nassau hall was converted into a memorial to these men, and a scholarship has been founded in memory of each. During the war nearly half of the faculty was on leave of absence, either in military and naval service, or in the scientific war service of the American, British or French Governments. The student body was cut more than half; buildings were occupied by a Government school of aviation and a naval paymasters' school, while the laboratories were turned over to Government use. With the institution of the student army training corps, and the naval training unit, virtually the entire university and its equipment were devoted to national purposes, the number of civilian students being about 75, rejected from service for physical disabilities. After the return of peace, effort was concentrated on increasing the inadequate endowment of the university, and the sum of over \$8,000,000 was raised. A bequest from the late Henry C. Frick, not yet received in 1921, was expected to amount to about \$5,000,000. In the year 1920-1 the faculty numbered 213, the undergraduate body 1,814, the graduate students 149, as against, in 1909-10, 169 faculty members, 1,266 undergraduates and 134 graduate students. Besides the graduate college, which includes the Cleveland tower, a national memorial to President Grover Cleveland, a trustee of Princeton, the buildings erected between 1912 and 1921 were Holder hall (a dormitory), Madison hall (the university dining halls, where all underclass men are required to take their meals), Cuyler hall (a dormitory), the Palmer Memorial football stadium, and the University boat house (headquarters of the rowing activities of the university). In May 1920 Dickinson hall and Marquand chapel were destroyed by fire. (V. L. C.)

**PRISONERS OF WAR** (*see* 28.314\*).—The procedure laid down by international agreement for the treatment of Prisoners of War under the Hague regulations was tested during the World War under unprecedented difficulties. These arose not only from the passions and prejudices inevitably engendered in the course of such a vast conflict between the entire manhood of the nations concerned, but also from the facts that unexpectedly large numbers of combatants were taken prisoners, and that the captors had to deal with men of different nationalities, of varying characteristics and with widely different views as to the accommodation and food requisite for a prisoner of war.

Probably few people realized during the war how vast was the number of combatant prisoners taken by one side or the other, or how small was the proportion of the British prisoners to the whole number. Though the final figures cannot be given otherwise than approximately, it is certain that they amounted to several millions. To name only the principal belligerents (excluding Russia), Great Britain claims to have taken just under half a million, France just over that number, Italy nearly one million, Germany two and a half millions and Austria nearly one and a half millions. With regard to Russia the numbers have never been even approximately ascertained, but some idea of them may be gathered from the fact that Austria alone admitted to having lost to the Russians not less than one and a half millions. To the list must be added the prisoners captured by the Americans (48,000 in number), and by the Turks, Bulgarians and the other lesser belligerents. Of this vast host only about 200,000 (probably not much more than 2%) were British, and about 185,000 of these were in the hands of Germany.

When it is further remembered that sometimes in the course of a single operation tens of thousands of men, many of them wounded, were added to the number captured earlier, it will be understood how great was the strain placed on the captors' resources in the matter of transport, care and feeding. Moreover, prisoners were taken in almost every part of the globe in every kind of climate, and in conditions in which the means of supply and transport varied from being comparatively complete to being almost non-existent. Even if all the belligerent Governments had been actuated by the most earnest desire to apply strictly the provisions of the Hague Convention it was inevitable that there should be much suffering and, owing to the difficulty of effective supervision, cases of cruelty and ill-treatment at the hands of individuals.

It must be recognized that, speaking generally, the administrative problems in relation to the treatment of prisoners were not so serious in Great Britain as in most of the belligerent States, but it is satisfactory to be able to record that they were humanely and for the most part satisfactorily solved as they

arose. It is on the other hand unfortunately true that, quite apart from the misery inseparable from prolonged confinement, numbers of British prisoners underwent gratuitous and grievous suffering, especially in territory merely occupied by the enemy and at some of the working camps in Germany, in Bulgaria and in Turkey.

While something is said below with regard to the treatment of prisoners by the Bulgarians and Turks, it is impossible here to attempt to deal with the whole area of hostilities and with the multitude of questions relating to prisoners which arose between the belligerents. This article, therefore, will deal chiefly with the lot of prisoners in Great Britain and Germany, and the application of the Hague regulations in those countries.

Though discussions arose as to the position of such persons as reservists and officers of merchant ships, prisoners of war may be divided into two main classes: (1) Civilian, (2) Combatant.

(1). *Civilian*.—It is quite certain that the framers of the Hague Convention had not in view the treatment of persons other than combatants, but such large numbers of civilians were interned during the war that the arrangements made for them must shortly be considered.

The internment of civilians in both Great Britain and Germany was, as a system, possibly due to two accidental but different causes. In Great Britain it arose first from the widespread belief, justified probably only in a relatively small number of cases, that the German civilian population in England were either spies in the service of the German Government or an advance guard of a German army of occupation. After this feeling had died down, and release from internment had become general, the system had again to be resorted to after the sinking of the "Lusitania," largely in deference to wide-spread indignation at that outrage and for the protection of the Germans themselves. Even then, however, internment was not general. Every enemy alien had a right to have his case dealt with by an advisory committee, of which Mr. Justice Sankey was chairman and Lord Justice Younger was a member, and by this committee many exemptions were granted.

In Germany, on the other hand, the internment of civilians—ultimately much more indiscriminate than in the United Kingdom—resulted from popular indignation in Germany at the entry of Great Britain into the war.

Thus it was that in both countries—in England by end of Oct. 1914 and in Germany by Nov. 1914—nearly every male enemy national of military age was interned, and the system, as applied to civilians, became established in both countries, although its working in Great Britain was later modified in the manner referred to above.

*Accommodation*.—The accommodation in both countries was bad in the beginning. In Great Britain some prisoners were at first placed on board ships, but this was found to be unsatisfactory for many reasons. Considerable numbers of aliens were sent to the Newbury race-course, where they lived in loose boxes without any beds and without any adequate sanitary or cooking arrangements; as numbers increased tents were added and various improvements made, but the place was never satisfactory, and it was closed soon after the weather broke in the autumn. It is only mentioned because it seems more than probable that, characteristically enough, Ruhleben (itself a race-course) was selected by the Germans for the internment of British civilians as a reply to Newbury. The problem of finding adequate accommodation was difficult in England where there were eventually some 29,000 Germans interned out of a considerably larger number not interfered with. In Germany the difficulty must have been even greater, as in addition to two and a half million combatants there were nearly 112,000 civilian internees of different nationalities to be provided for; of these only between 5,000 and 6,000 were British.<sup>1</sup>

<sup>1</sup> There were in addition to German civilians interned in England a comparatively small number of internees of other nationalities and nearly 20,000 more in other parts of the Empire. The whole of the prisoners in German hands were of course confined in Germany or the occupied districts.

After the early unsatisfactory camps in England were closed, civilians were confined in large institutions of different kinds, but eventually far the largest number was placed in the Isle of Man, where there was created at Knockaloe a huge camp containing at last some 23,000 prisoners. There were also two "privilege camps" at Douglas and Wakefield, where those possessed of means could, upon payment, secure a certain amount of privacy and comfort, and employ as their servants other prisoners desirous of earning a little money. There was also Islington Workhouse, perhaps the best place of all, where enemy civilians with British-born wives, or some other claim to consideration, were interned.

In Germany the lot of those who were first arrested was worse than in England. They were cast into the ordinary prisons and treated like convicted criminals. After no long time, however, most of them were transferred to Ruhleben, which, with the exception of Schloss Celle, where a certain number of elderly civilians, whose status was somewhat uncertain, were placed, became the place of confinement for all British civilians.

Ruhleben was a race-course near Berlin, with stables, grandstand and all the usual appurtenances of a race-course. The prisoners were housed in the loose boxes and attics without at first any beds, though eventually ships' berths were fitted, six to a box. As the numbers grew, huts were added. The washing and sanitary arrangements, at first rudimentary only, were never satisfactory. No arrangements were made by the Germans for the housing of the prisoners according to their vocational or social affinities—a real boon in the case of civilians. They were allowed, however, ultimately to some extent to sort themselves.

**Management.**—At first in both countries the camps were conducted on military lines, but eventually the interned persons were left to manage the internal affairs of the camps very much by themselves. A camp captain was elected by them, and captains of huts or other divisions. The camp captain was the official medium of communication with the authorities.

**Work and Recreation.**—It was recognized in both countries that civilians might not be forced to do any work beyond what was necessary for the orderliness of the camp. This was a doubtful privilege, and the prisoners' want of occupation led to difficulties in maintaining discipline. In the latter stages of the war, at all events in England, a small proportion of prisoners volunteered to work in order to escape the ennui of camp life, and for some 1,500 out of the whole number, useful work was found, mainly in agriculture. No British civilians did any work outside the camps in Germany.

But much was done by the prisoners themselves. Workshops were organized and equipped with the assistance of the Y.M.C.A. (British and American), and other similar organizations. The difficulty in England was to find a market for the produce of the workshops, owing to the objections raised to the prisoners competing with British workmen. This was overcome by sending the articles manufactured to neutral countries.

Besides this form of manual occupation, classes were formed and lectures delivered, and students were enabled to continue their studies so far as their circumstances permitted, and a small number were employed in administrative work.

**Medical Care.**—Provision was made in England for the civilian prisoners by small hospitals in each place of internment, for the treatment of minor and urgent cases, while some who had been residents in Great Britain before the war were treated in outside institutions.

At Ruhleben a lazaret to which any prisoners could go was established at the Emigrants' Railway Station, close to the camp. The place had previously been used by a low class, and was filthy. The sanitation was bad, and the accommodation of the roughest description, while the attention given to the patients was, to say the least, perfunctory; a doctor came once a day, and there were no nurses or orderlies. After the first disorganization was remedied, there was what was called the Revier Barrack, with a waiting and consultation room, in which the doctor examined those requiring advice. The place had accommodation for emergency cases and those suffering from

accidents, and persons were kept under observation till it was decided what should be done with them. From here patients were drafted either to the lazaret above mentioned, or to Dr. Weiler's Sanatorium outside but near the camp, established at the suggestion of the American ambassador for the better treatment of the prisoners, in return for a substantial payment made either by the British Government, or by the patients themselves.

Besides these there was the Schonungs Barrack, a place for convalescents and the ailing. Though the building was provided by the German Government, the place owed its existence and all its amenities to the self-denying labours of Mr. Lambert, himself a British prisoner. It proved a real home of rest for those who were not ill enough to require hospital treatment.

One great defect in the arrangements made for the sick prisoners here was that the German Government, as in the camps where combatant prisoners were confined, provided no diet suitable for them. The ration was the same as for men in good health. A proper diet was provided in Dr. Weiler's Sanatorium in return for the substantial payment made by or on behalf of the patients, and in the Schonungs Barrack by Mr. Lambert with the assistance of friends in England.

Lastly, one further fact should be mentioned. In a few exceptional cases persons were allowed to proceed to places far removed from Berlin to complete "cures" which had been interrupted by the outbreak of war.

The position with regard to the care of sick civilian prisoners may be summed up as follows: The German Government provided some, but inadequate, accommodation for the very poor, and did not put any great obstacles in the way of prisoners who could themselves afford, or for whom the British Government or others were willing, to pay for better treatment.

(2). **Combatant Prisoners.**—In considering the application of the Hague Convention to the combatant prisoners, it is impossible to deal with all the subjects mentioned in it. It is proposed to deal at length only with the principal matters, viz. accommodation, food, the application of the military law of the captors, and after touching on a few less important subjects, to consider how the great general principle enunciated in Article 4, that prisoners must be "humanely treated," was acted on.

**Accommodation.**—German officers in Great Britain were interned in large country houses and public institutions adapted for the purpose, to which, as necessity arose, additions were made, usually in the form of wooden huts. The necessary furniture and everything reasonably required for messing, as well as fuel and light, was provided free of charge. In Germany, however, the housing was in many cases bad and unsuitable. British officers were confined in the casemates of fortresses, as at Ingolstadt; in the men's barracks, as at Crefeld; in disused factories as at Halle, or in huts which had been previously occupied by the rank and file of other nations, as at Holzminden. The best accommodation was in some of the hotels, as at Augustabad, where, until the place became crowded, conditions were comfortable. The British prisoners had to provide, at their own expense, cutlery and everything required for the table, as well as fuel and light, which last caused considerable hardship in winter, for some of the camps were established in summer resorts slightly constructed and at a high altitude.

The actual position of the German places of confinement was undoubtedly chosen in some cases with ulterior objects in view. Thus, the quarters provided right in the middle of the Badische Anilin und Soda Fabrik at Ludwigshafen, and in the centre of Karlsruhe, were undoubtedly chosen in the hopes of warding off air attacks on those places or for the purpose of involving nationals of the raiders in the results.

The men's camps fall into two classes—the large main camps and the working camps.

In both countries the arrangements in the main camps were similar. The camps consisted of groups of huts, either attached to some barracks or similar place, or quite independent, with the necessary cook-houses, baths, latrines and administrative block, all surrounded by a barbed wire fence. There were frequent and justifiable complaints of overcrowding in the German

camps. At Wittenberg, for instance, there was, when the camp was full, a population of from 15,000 to 17,000 on an area of about 20 acres. There was usually a building set apart for religious services and recreation in the form of concerts and theatrical performances. The sleeping accommodation consisted of bunks arranged in two or sometimes three tiers. The camps were divided by barbed wire into compounds containing about 1,200 prisoners—camps within a camp.

*Working Camps.*—The housing of the prisoners sent out to work is more difficult to deal with comprehensively, for it depended so much on the locality and nature of the work, quite apart from the goodwill or otherwise of the employer. According to the German regulations, there ought to have been five cubic metres of internal capacity for each prisoner of war. This regulation was by no means always observed. The accommodation provided in Germany varied from a single very-well-lit and ventilated bedroom in a farm to crowded filthy quarters in verminous draughty buildings in mines, quarries and brickyards. In the larger working camps, buildings were sometimes erected for the express purpose of housing the prisoners, and, though not infrequently overcrowded, were generally suited for this purpose. These buildings were sometimes of brick, more usually of wood, set up somewhat above the ground level. In E. Prussia, however, and in a few other places, a construction common in the neighbourhood was used. The huts were sunk into the ground and were in fact something like large lined dugouts roofed over. They were not satisfactory for considerable numbers, but had the advantage that they were in that bleak district warmer in winter than if they had been erected wholly above ground. In other cases, the prisoners lived in the quarters which at many mines and large industrial works the employers provided for their own bachelor workmen. Such quarters were usually satisfactory. The situation of these quarters, of course, depended on the conditions existing locally, and the nature of the work. In mines they were usually in the mine compound, in some places they were situated at a distance from the actual place of working, and thus was added to the day's labour a walk of occasionally as much as 5 km. each way—a serious addition if the work was severe. But in the majority of cases there were no workmen's quarters, and it was impracticable to build barracks for only a few prisoners. Accommodation was then provided in village recreation halls, inns, theatres and similar places. They were not well adapted for the purpose, but where a little goodwill was shewn on both sides, were often made reasonably comfortable.

In a few cases, at Kiel and elsewhere in that neighbourhood, the prisoners lived on board ship where the accommodation, according to the neutral reports, seems to have been satisfactory.

In the places dealt with above, good provision was usually made for bathing, personal washing and laundry; in many mines and industrial works the men were able to get a hot shower-bath daily. In some places, on the other hand, the quarters provided were disgusting. To take two instances out of many which might be given. At Fangsläuse, attached to Döberitz, where the men were engaged in refuse sorting, the barracks consisted of a wooden building divided into two rooms, which were very dirty, in a verminous condition, and overrun with rats and mice. There were no arrangements for bathing or washing; the only opportunity the men had for washing being afforded by a canal near by. At another place, a coal-yard, the men were housed in an archway under one of the main lines running into Berlin, and bathing arrangements were *nil*.

In Great Britain, prisoners of war sent to work were either housed by the military authorities or, in some cases, when engaged in agriculture, by the employer, who was bound to supply housing accommodation, straw for filling palliasses, cooking utensils, crockery, facilities for washing and artificial light. As in Germany, it was not always found possible in England to house prisoners near their work. Any time required to reach and return from their work in excess of one hour was deducted from the hours of labour. One rest day a week was allowed in both countries.

*Work.*—The construction placed during the World War by the belligerents upon Article 6, which enables the captors to employ the labour of prisoners of war and to authorize them to work for the public service or private persons, probably caused more ill-feeling than any other cause, for the result was to reduce hundreds of thousands of men temporarily to virtual, if not nominal, slavery. In the war of 1870-1 the Germans took some 400,000 French as prisoners. They were permitted, but in no way forced, to work in factories and elsewhere. During the World War, with many exceptions, it is true, practically all able-bodied prisoners, except officers and non-commissioned officers, were ultimately forced to work.

Early in 1915 the British prisoners in German hands were invited to volunteer for work outside the main camps. They refused almost to a man. Then by degrees pressure was applied, and soon men who refused were punished for their refusal, and, eventually, as mentioned below, a formal pronouncement on the subject was made by the German Military Courts.

Meanwhile, a question arose as to the employment of non-commissioned officers. As early as February 1915, the German Government suggested certain privileges for superior non-commissioned officers, and eventually an agreement was come to, that non-commissioned officers should not be compelled to work, except as superintendents, unless they volunteered to do so. A camp was formed for non-commissioned officers at Grossenweder Moor, in the notorious X. Army Corps district, and steps were taken to obtain volunteers for work by withdrawing all privileges and forcing the men to march on parade for nine hours a day. The men did not volunteer and eventually the conditions were improved.

The question of the nature of the work which could be properly demanded of prisoners of war was early found to be a difficult one. In a war of nations such as the World War every able-bodied man replaced by a prisoner is a potential soldier, and, in these circumstances, any work in the enemy country might be said to be "indirectly connected with the operations of war," especially in cases in which the prisoner was engaged in any step in the manufacture or transport of any one of the multitude of articles necessary for an army in the field.

The position first taken up by the German authorities was that so long as prisoners did not actually handle the finished product—arms, ammunition and such like—there was no infraction of the rules of international law. This, however, did not really cover the whole ground, and the matter was eventually formally considered by the German Military Courts, and the following principles were laid down:—

- (1) The work on which a prisoner of war may be employed can only be judged on the merits of each particular case.
- (2) It is illegal to employ prisoners of war in the manufacture of munitions intended for use against their native country or its allies.
- (3) They may be employed in agricultural or forestry work, as well as on military property, e.g. the improvement of parade and drill-grounds and of rifle ranges.
- (4) They may be employed on preparation work, e.g. the transport of coke or of ores for the manufacture of shells, because there is no direct connexion between such work and military operations.
- (5) They can only claim exemption from such work as stands in direct relation to military operations in the area of hostilities.

These principles were accepted by the British War Office and the commanders-in-chief of the British armies, and seem on the whole to have been fairly acted on by the German authorities except behind the lines on the eastern and western fronts, though in some cases individual commandants attempted to force men to take part in the actual manufacture of such things as shells, parts of fuzes and the like.

There seem to have been a large number of them employed in labouring work, handling the actual material for guns, shells, etc., in places where munitions were made, and some cases in which they had to take an active part in the manufacture of the finished article certainly did occur. At Krupp's Germania wharf at Kiel, prisoners were employed in riveting ships, including the outsides of submarines, while at Mannheim a number of British were made to work in the manufacture of sulphuric acid in the middle of a large munition factory.

The authorities naturally reserved to themselves the right to say what work the prisoners could be forced to do, but, at all events in the early years of the war, they promised to give to the prisoners certificates that they had been forced to do the work to which they objected in order to protect them against proceedings in their own country. The promise seems to have been very seldom kept.

Setting aside work directly or indirectly connected with the operations of war there seems to have been no kind of work which prisoners were not called on to perform. They were employed in every kind of manual labour, including work in mines, from skilled engineering to scavenging. This last seems to transgress the principles laid down in the German War Book, that "these tasks" (to which prisoners can be put) "should not be prejudicial to health nor in any way dishonourable."

In Berlin prisoners were sent to work in a slaughterhouse; at three places they were obliged to do scavenging in the public streets, while at two places at Kiel, and at four places near Berlin they had to collect and sort the rubbish of the town. The visitor of the protecting Power says in his report of one of the places at Kiel where only British prisoners were employed, "the work the prisoners are called on to perform is of a particularly revolting character."

In Great Britain, the principles above stated having been accepted, prisoners were employed in accordance with them, but none were employed in mines, nor were such degrading tasks as scavenging and refuse-sorting imposed on them. A large number were employed in France in various capacities not directly connected with the operations of war, and, after the Armistice, in general salvage work.

The organization of the working camps was much the same in both countries. Each working camp was connected with a main camp, which was the centre for all administrative purposes and upon its books the prisoners were borne.

In Germany the working camps were divided into three classes:—(a) those which the representative of the protecting Power might visit freely and see the men at their work and in their quarters; (b) those in which he might see them in their quarters but not at work; and (c) those in which he was admitted neither to the work nor to the quarters but was allowed to see one or more prisoners outside. It has been suggested that this classification was due to the influence of some of the great industrial magnates who objected to their works being visited by outsiders, but, however this may be, the third class was a very small one, and the prohibition with regard to the second and third classes does not appear to have been very strictly enforced.

*Pay.*—The provisions of the Hague Convention with regard to pay are too vague to be of any real value.

In the II. Army Corps district the German regulations, which may be taken as typical, seemed to contemplate a payment by the employer of the customary local wages, of which the military administrative department took three-quarters for board, lodging, guarding, etc., and the prisoner was credited with one quarter, which he received in token money. In practice, a prisoner working on the land generally himself received 30 pf. a day, in mines from 75 to 90 pf., and in industrial works from 50 pf. to even several marks a day. In some cases a premium was paid to prisoners who did more than the minimum.

Prisoners of war in British hands, when employed by the Government, received the same rate of pay as that given to British soldiers as working pay. When employed by private persons or corporations the employer in England was obliged to pay the full current rate of wages to the Government by whom the prisoner was paid. Piece-work or task-work was adopted where possible and extra pay given where the task was exceeded. The rates were so adjusted that a man of moderate industry could earn the equivalent of time-work earnings; and a very industrious man could earn more. Time-work was paid at rates which ranged according to circumstances from 1s. 4d. to 8d. a day. These sums were credited to the prisoner, but power was reserved to the commandant to decide the amount actually issued to the prisoner.

*Food.*—Article 7 imposes on the captor State the duty of maintaining its prisoners, and provides for their being treated as regards rations, quarters and clothing on the same footing as its own troops. This article is difficult to understand; it is not clear whether prisoners are to have the same rations as soldiers in the field or at home; or whether they are to be placed in barracks with the same space and conveniences as the captor's soldiers. How this last matter was actually dealt with has been already explained. Whatever may be the true construction of the article, none of the belligerents observed the letter of it with regard to food. Difficulties arose, not merely from the steadily decreasing supplies, owing to the submarine war on one side and the blockade of Germany on the other, but also from the difference in the kind of food appreciated by the subjects of the two countries. At a time when the Germans interned in England were receiving the full peace-time rations of the British soldier, they were complaining of the insufficiency and unpalatable nature of the food. On the other hand, the British prisoners—even when supplies were sufficient in Germany—complained of the brown or black bread, and of the soup, which is liked by the continental working man.

In England, after a short time, no rations were issued to officers. Canteens were established, and subject to regulations for the prevention of undue luxury, the German officers could provide such food as they wished, which was prepared for them by cooks of their own nationality.

In Germany it was different. Rations were issued, though not always partaken of. The British officers, at all events after the war had continued for some time, lived almost entirely on supplies obtained from home. The rations in Germany were issued according to a scale based upon a scientific analysis of the composition of the food given, which showed a daily average in grammes of albumen, fat and carbo-hydrates, and the number of calories. These, as determined by the Kriegsministerium for the last week in Sept. 1916 at Parchim Camp, averaged daily 75.6, 24.5, 368.4 and 2,019.4 respectively.

It perhaps throws some light on the sufficiency of this ration that in July 1918, nearly two years later, it was agreed between the representatives of Great Britain and Germany, who met at The Hague, that the combatant prisoners of war should receive as far as possible the same allowance of rationed articles of food as the civil population, and that in no case should the daily caloric value fall below 2,000 calories for non-workers, 2,500 for ordinary workers, and 2,800 for heavy workers.

It may be doubted, however, whether at any time in German camps the prisoners received even these moderate amounts of food; and as the supplies became more difficult to obtain, they probably received considerably less, even in the working camps. Even if they did, such things as fish roe, soya flour, soya oil, buckwheat and "blutwurst" do not appeal to a British soldier, however admirable they may be from a scientific point of view as articles of food, especially when they are all boiled together and given in the form of soup.

In England the scales were not drawn up in exactly the same way. If we take the principal articles of food, up to the middle of 1916 the German prisoners received a daily ration of 1½ lb. of bread, 8 oz. of fresh or frozen meat or 4 oz. of preserved, 2 oz. of cheese and 1 oz. of margarine. By Dec. 1917, the ration had been much reduced. The bread ration was 13 oz., for 4 oz. of which broken biscuit was substituted when obtainable. Meat was given on three days a week only, but a ration of 10 oz. of herring was added on two days. The 2 oz. of cheese and 1 oz. of margarine were given till Oct. 1918, when both were reduced. In the case of non-workers, the bread in Oct. 1918 was reduced by a quarter of a pound, the cheese omitted, and the margarine further reduced. In England, as in Germany, the prisoners had to share in the privations of the civilian population.

In both countries the rations were supplemented by parcels of food which were sent to the prisoners. At first they were sent from England by individuals and associations, but before long great abuses arose. Some British prisoners received large numbers of parcels, not infrequently far beyond any possible require-

ments. Others received nothing, and there can be no doubt that in not a few cases gross fraud was practised on sympathetic persons. Early in 1915 the Prisoners of War Help Committee was established in London. It tried to coördinate the work of the different associations and individuals, but failed as it had no powers, and was dissolved in Sept. 1916, when the Central Prisoners of War Committee of the British Red Cross and Order of St. John was officially established and without its authorization no individual or body could send a parcel to a prisoner.

Amongst its functions were (1) to authorize committees, associations and approved shops to pack and despatch parcels to prisoners of war, (2) to control and coördinate the work of all such committees, associations and shops, and (3) to act as a care committee for all prisoners who for any reason were without a care committee, for all civilian prisoners, and, after Oct. 1917, for all officer prisoners.

Under the presidency of Sir Starr Jameson, Bart., and, after his death, of the Earl of Sandwich, the committee of which Sir P. D. Agnew was vice-chairman and managing-director, not only organized the whole of the despatch of parcels of food and other things to the prisoners of war by 181 care committees, 81 local associations and 67 shops, but packed and despatched parcels to individual officers and men, numbering, at the date of the Armistice, no less than 47,500. Three parcels of 11 lb. weight were sent each fortnight to every prisoner and contained, together with 13 lb. of bread sent once a fortnight from Copenhagen or Berne, sufficient, without other food, to maintain a man doing reasonably hard work. Officers did not come under the scheme till the autumn of 1917.

At first the scheme was very unpopular, because it interfered with the power of individuals to send what they liked to their friends, and in April 1917, a Joint Committee of both Houses of Parliament was appointed to enquire into it. The report was published in June of that year, and while paying a high tribute of praise to the work accomplished made certain suggestions which did much to allay the discontent, as they provided for the introduction of the personal touch into the parcels. In its main features the scheme continued till the end of the war.

Besides the despatch of parcels to individuals the Committee sent food, either in bulk or in the form of emergency parcels, to the larger camps in Germany, for newly captured prisoners.

Though it is obvious that the despatch of parcels of food on the great scale indicated above relieved the German Government of a very great responsibility, yet it must be recognized that credit is due to the German nation for the fact that all but a small percentage reached the addressees to which they were sent, notwithstanding that they contained articles unobtainable in Germany, except by the very rich.

Though it is true that the parcels arrived, it is also true that in some camps the German commandants as a punishment delayed or prohibited for some days or even weeks their issue to the addressees, and that there were complaints as to the way in which the censoring of the contents of the parcels, necessary of course to prevent the introduction of prohibited articles, was carried out. Latterly, however, in all good camps the parcels were opened in the presence of the addressee, and the tinned food was stored and not opened till it was required.

Owing to the increasing shortage of food in Germany, and to the fact that the rations in England for a long time were maintained at a reasonable level, the number of parcels sent to German prisoners was far smaller than that sent to British prisoners. At first a considerable amount of food was sent into the German prisoners' camps in England from their relations and friends residing in Great Britain, but when the shortage became acute it became necessary to prohibit this practice.

The Hague Convention also requires the captor to treat his prisoners as regards clothing on the same footing as his own soldiers. The German Government claimed that it strictly observed this article and forbade the sending of clothing by the British Government. The article was not observed at all in some German camps, and great trouble was caused by the claim, in at all events some army corps, that boots were part of a sol-

dier's military equipment, and that the captors were entitled to take them. The clothing in any case supplied by the Germans was quite insufficient, and arrangements were made by which an adequate supply was despatched according to a regular scale. Some of it went astray and some was stolen, although a good proportion reached the addressees. In England clothing was issued when necessary to enemy prisoners, other than officers, on a regular scale, which provided for them having a sufficient change of clothing, while in both countries officers made their own arrangements for the supply of the necessary clothing.

*Application of the Military Law of the Captors.*—Article 8 enacts that prisoners of war are subject to the laws, regulations and orders in force in the army of the captor State, a provision which gave rise to a good deal of trouble, owing, in England, to the difficulty of carrying it out strictly—while in some cases, as in Bulgaria, punishments were allowed—such as flogging—for ordinary breaches of discipline—which were quite alien to British ideas of what is permissible.

The German military law is in general far more severe than the British, and there is this further great difference, that in Germany officers as well as men may be summarily sent to cells or awarded other severe punishments for trivial offences, while in the United Kingdom, strictly, any offender above the rank of private should have been tried by court-martial, a provision amended during the war by the substitution of military courts.

In another respect the German code is more severe in that all sentences of arrest involved solitary confinement, while one of close arrest, which was limited to four weeks, meant that the prisoner was confined in a dark cell, with a plank bed and bread and water diet, though these aggravations of the punishment were omitted on the fourth, eighth and subsequently every third day, the prisoner receiving the ordinary camp diet on these days.

One punishment officially termed "field punishment," but more generally known in England as the "post punishment," caused a great outcry in that country and much resentment among British prisoners in Germany. It is provided in the German *Manual of Military Law* that the punishment is to be inflicted in a manner not detrimental to the health of the prisoner, who is to be kept in an upright position with the back turned to a wall or a tree in such a manner that the prisoner can neither sit nor lie down. These last words were construed to mean tying the prisoner to a post; sometimes his feet were placed on a brick which was removed after he was securely tied, and sometimes his hands were secured above his head. Apart, at all events, from these aggravations, this punishment was in strict accordance with the military law of the captors; indeed it corresponds to the field punishment No. 1 authorized by the British military law and described in the rules for field punishment for offences committed on active service made under Sec. 44 of the Army Act. These rules authorize the keeping of the offender in fetters or handcuffs or both, and when so kept he may be attached by straps or ropes for a period or periods not exceeding two hours in any one day to a fixed object during not more than three out of four consecutive days nor more than twenty-one days in all.

In Germany all prisoners are liable to be treated as "in the field," i.e. on active service. In one respect, viz. the punishments for attempted escape, the German military law was less severe than the British, the greater severity of the latter having apparently arisen from a misunderstanding of the expression "peines disciplinaires" in the second paragraph of the 8th Article of the Hague Convention. This seems to have been understood on the Continent as a punishment which could be awarded summarily: that is, arrest, open, medium or close, for a period not exceeding six weeks. In Great Britain the punishment was limited to 12 months' imprisonment; in Germany it was far less for the simple offence, though it was frequently added to by the addition of charges for damaging Government property, and the like. The matter came under discussion between the British and German Delegates at The Hague in 1917 and 1918, and an agreement was arrived at by which the punishment for a simple attempt to escape was to be limited to fourteen days, or if accompanied with offences relating

to the appropriation, possession of or injury to property to two months' military confinement.

In addition to the summary punishments, there were, of course, in both countries the punishment of death and imprisonment, which could only be inflicted by court-martial. In some cases the German code lays down minimum punishments of great severity, and in many of those cases, in which the infliction of very severe punishments properly raised a great outcry in England, the German court-martial had no option but to pass them. The British military law on the other hand has only one offence—murder—for which there is a fixed punishment; for others it is "such less punishment as is in the Act mentioned."

In one respect the prisoners of both countries never were satisfied. Neither understood or appreciated the procedure of the other. The British never understood the long delays, sometimes it is to be feared deliberate, which occurred in bringing them to trial for alleged offences, and during which they were kept under arrest, nor, owing to their ignorance of the German military code, could they understand the very severe sentences necessarily passed by courts-martial (which seem usually to have been conducted with fairness), nor the right of the prosecutor to appeal against a sentence which he considered to be inadequate.

On the other hand, the Germans never appreciated the British procedure, nor could they understand the absence of any right of formal appeal from a sentence, for which ample provision is made in Germany, even against the award of a disciplinary punishment, a right which, oddly enough, by Sec. 52 of the Regulations relating to it, the accused shared with the prosecutor "only when the sentence has been carried out."

*Parole.*—Articles 10, 11 and 12 deal with the subject of parole. In the World War no combatant prisoners, with one exception, were allowed to leave Germany or Great Britain on parole, or to reside outside the camps. The only cases in which questions arose were with regard to the temporary parole given when officers left their camps for a walk, and the parole given by those who were interned in neutral countries. According to the custom of the British Army no officer ought to give his parole, it being his duty to escape and rejoin his unit if he can, nor can anyone below the rank of officer give a parole. In both countries, however, officers were eventually allowed to go out for a walk in parties accompanied by an officer, each giving in writing a temporary written parole that he would not attempt to escape, nor during the walk make arrangements to escape, nor do anything to the prejudice of the captor State. The parole was given on leaving the camp and returned on reentry.

The case of those interned in neutral countries was different. The British officers of the Royal Naval Division interned in Holland after the fall of Antwerp were permitted to choose their own residence in Groningen on parole, the men being interned close by. This privilege was withdrawn for a time, and the officers were interned in a fortress, but it was restored later.

As time went on, the Netherlands Government permitted officers to return to England and Germany on parole, on proof of the serious illness of a near relative, a concession which was afterwards extended so that regular periods of leave were enjoyed by both officers and men, the former giving a formal parole and the latter a promise to return on the expiration of their leave, while the British Government gave its assurance that the men would not be employed on any work to do with war, and would return at the end of their leave. Similarly, the Danish and Norwegian Governments granted leave to British and German combatants interned in their countries.

No parole seems to have been taken from those officers who were interned in Switzerland or Holland under the agreements made in 1917 and 1918 with the German Government.

*Relief Societies.*—Article 15 deals with societies for the relief of prisoners. An immense amount of valuable work, impossible here to particularize, was done by such societies. The American branch of the Y.M.C.A. especially did much for the prisoners in England and Germany, being permitted to work on the following conditions, substantially the same in both countries.

A building or tent might be erected in the camp with the consent of the general officer in command of the district or army corps, but nothing might be sold in it nor could any one be employed there other than a prisoner. A member of the association might visit the camp once a week for a definite time. He might hold services, provide materials for games, entertainments and employment, arrange instructional courses, provide books (subject to censorship) and writing materials other than writing paper and envelopes. Nothing might be given to or received by a prisoner without the commandant's consent.

*Recreation.*—No express provision is contained in the Hague Convention relating to the occupation of prisoners in their leisure time, but much of the good work done by the societies had to do with the recreation and education of prisoners. In both countries, and in nearly all camps, provision was eventually made for sufficient space for recreation and exercise, but this was not the case at first. At Halle, for instance, a German camp for officers, established in a disused factory, the only place for exercise was the space enclosed by the three buildings, in which some 500 officers lived. It measured about 90 yards by 50, and in winter was a morass of water and mud; in summer deep in dust. In some of the men's camps the space was very confined, and organized games of any kind were impossible. But later things improved, and in most provision, sometimes at the prisoners' expense, was made for sufficient room for tennis, football and other games.

In England, facilities were provided by the War Office. To take two typical instances, it may be said that at Donnington Hall for German officers, there was a considerable space in front of the house, and at Dorchester, for men, there was a large field where any games could be played.

As time went on, walks outside the camp were permitted for officers on their giving a temporary parole, and in Germany, in some of the larger working camps, the men were allowed out for walks on Sunday.

With regard to educational facilities, in England both officers and men made their own arrangements, as they did in Germany, with the full concurrence of the authorities. At Münster, for instance, the general officer commanding excused all students from work, and much was done by some of the prisoners in the organization of classes and lectures. The neutral organizations, such as the American and Danish Y.M.C.A.'s, also did a great deal in this direction, as did certain of the German civilians in the neighbourhood of the great camp at Göttingen. Professor Stange and some of his colleagues interested themselves in the prisoners and organized the educational work in the camp, and he himself had an office there where he was accessible to prisoners, and assisted them with his advice on educational matters. He used even to obtain the requisites for games through the Red Cross in Switzerland. Unfortunately for them, all the British prisoners were ultimately removed from Göttingen, which had become something of a model camp.

Some of the larger employers were also very considerate in this respect, providing recreation halls and fields for playing games, and even musical instruments. At Mulheim the Dutch visitor found the employers had paid the expenses of the prisoners' Christmas festivities.

*Letters.*—Article 16 was observed by both countries, except that at one time in some of the camps in Germany customs duties were charged on the contents of parcels, but this seems to have been due to some misapprehension, and was soon abandoned. Prisoners were as a rule allowed to write two letters a month and a postcard every week, and, in addition, a postcard in the prescribed form acknowledging the receipt of a parcel. But later in the war a "first capture postcard" was introduced, by which on a printed form a prisoner was allowed to notify to his relatives his capture, his state of health and his address.

*Pay.*—Article 17 provides for officers receiving the same rate of pay as officers of the corresponding rank in the army of the captors. This provision was not observed by the German Government, who paid subalterns 60 marks a month and other ranks rather more. Accordingly, the British Government

declined to carry out the terms of the article and paid the German subalterns 4s. a day and other ranks 4s. 6d., naval officers being paid according to their relative rank. Out of this an officer was required to pay for his food, laundry and clothing, a deduction being made if he was in hospital (where, of course, he was provided with everything necessary). By an arrangement made later the German Government was allowed to make a small addition to these daily rates of pay. Medical officers employed in the care of sick and wounded prisoners of their own nationality received the full pay of medical officers of corresponding rank in the army of the captors.

*Religious Exercises.*—Article 18 is designed to secure to prisoners complete liberty in the exercise of their religion, and during the World War no real complaint was made on either side.

In the United Kingdom German pastors who had been resident in the country were allowed to hold services in the camps, but difficulties arose and the permission was withdrawn. Thereupon some pastors elected to be interned, with a view to ministering to the prisoners. Later, however, the permits were issued in a modified form, and English and American clergy and laymen and members of the Danish and Swiss Student Christian Movement were allowed to visit the camps, the necessary funds being provided by the American Branch of the Y.M.C.A. The Roman Catholic prisoners were usually attended by the priest of the district in which the camp was situated and every facility was given to them. Where no German-speaking priest was at hand the Cardinal Archbishop of Westminster charged the German priests of his archdiocese to visit the camps every now and then in order to enable the prisoners to go to confession and to hear a sermon in their mother tongue.

In Germany, at first, the Rev. F. Williams, who had been in charge of the English Church in Berlin, was allowed to visit the different camps and hospitals. But this permission was withdrawn and the prisoners were left to conduct their own services, to which, except at Grossenweder Moor, no objection was raised. A few British chaplains were captured, and did good work until they were repatriated. Great assistance was given also by the American branch of the Y.M.C.A., and by Archdeacon Nies, an American clergyman at Munich, until the United States came into the war.

The German clergy also did what they could for the prisoners in many camps and hospitals. Some of them were spoken of very warmly by the British prisoners.

The needs of the Roman Catholics were more easily met owing to the presence among the French prisoners of many priests who did excellent work, and the Bishop of Paderborn (afterwards Archbishop of Cologne) did much for the prisoners. Moreover, Father Crotty was sent from Rome and was permitted to minister at Limburg and Giessen, partly perhaps because he was an Irishman, and it was hoped his influence might be useful to the Germans.

In the German working camps there was no regular provision for religious services, though Mr. Williams seems to have visited some of the larger places, and in one district a German pastor is said to have travelled around the small camps and ministered to the prisoners. There was a standing order of the Kriegsministerium that, at all events in the country districts, the prisoners should be allowed to attend the local churches. This, though of value to Roman Catholics, was not much use to the Protestants, owing to the difficulties of language.

At Zossen the Germans built a mosque for Mahomedan prisoners, and generally arrangements seem to have been made to avoid hurting religious and caste prejudices.

*Medical Treatment.*—Up to this point an attempt has been made to show how the provisions of the Hague Convention were applied in Great Britain and Germany. But this Convention does not deal with everything which affects the well-being of prisoners of war. The Geneva Convention of 1906 requires the belligerents to respect and take care of the wounded and sick without distinction of nationality, and leaves them at liberty to agree for the restoration of wounded left on the field, the repatriation of wounded after rendering them fit for removal

or after recovery, and for handing over the sick and wounded to a neutral State to be interned by it till the conclusion of hostilities. What was in fact done must be considered under three heads: the attention given (1) in the regular hospitals, (2) in the main camps and (3) in the working camps.

*Hospitals.*—In Germany at first there seem to have been inadequate arrangements made for the reception of seriously wounded prisoners, but later well-arranged and well-equipped hospitals were available, the principal being in Berlin, at Cologne and Paderborn, though of course there were a large number elsewhere. As time went on and the pressure on Germany became more and more acute, the supply of medical requisites became deficient, bandages were made of paper, drugs and anaesthetics were less plentiful, but, though naturally British prisoners would fare worse than the wounded Germans, there is no evidence that the former were intentionally deprived of anything necessary for them if there was an adequate supply.

The conduct of the German doctors to the prisoners in the regular hospitals is one of the bright pages in the sad history of the World War, and is worthy of their great profession. Most of the returned British prisoners reported that the doctors were kind and humane, while many of them spoke of them in warmest possible terms and told how the doctor had said that when a prisoner was wounded or ill he no longer looked on him as an enemy, or how, though he hated the English, he did his very best. There were exceptions, who formed a very small minority. The large majority of German doctors worked hard, often with infinite kindness, in the interests of those in their charge, and unreservedly placed such knowledge and skill as they possessed at the disposal of the prisoners.

The nursing in Germany was carried out by orderlies, by trained nurses or by sisterhoods. It seems to have varied very much. In some cases it was good and kind, in some indifferent, and in some rough and bad. But there appears to be no reason to think that in any case it was intentionally less good than circumstances permitted.

*Main Camps.*—The same satisfactory account of the medical arrangements in the main German camps cannot be given, even after the first disorganization was overcome. There was in each camp a lazaret providing accommodation for a number proportionate to the number for which the camp was designed, but the arrangements were often very incomplete.

There seem to have been a large number of Russian doctors employed in the German camps, while in a few, for short periods, English medical officers were employed—though in all cases a German seems to have been responsible. The nursing was in the main done by prisoner orderlies, many of whom of course were quite untrained, though they seem to have done their best. It is impossible to generalize as to the conduct of the German medical staff in hundreds of camps over a period of four years, but the general impression produced by the evidence is that the staffs were humane and did all they could.

There is reliable evidence that the nature of the food provided in the German camp hospitals, as distinguished from the regular hospitals, where, until supplies became very short, it seems to have been satisfactory, was quite unsuited for invalids. A sick prisoner was a non-worker, and therefore received the ordinary camp ration, less 10 per cent. This was even the case in the typhus camps, where the requisite milk and light food for the fever-stricken patients had to be provided by the British and Allied medical officers themselves.

There seems to have been insufficient care, at all events in the early stages of the war, to prevent the spread of tuberculosis by the segregation from the healthy of those suffering from that disease. Later, however, steps were taken to effect this, and more than one place was established exclusively for tuberculous patients, while the arrangement made for their internment in Switzerland did still more to deal with this evil.

It must not of course be said that this mingling of the sick and healthy was deliberate. It was probably due to want of thought, an excuse which cannot be made for the policy adopted by the German Government of mixing all the Allies together,

although this was bound in the circumstances to lead to an excessive amount of illness. This policy was quite deliberate. Mr. Gerard, the American ambassador to Germany, in 1915 raised the question with the German authorities with regard to officers, and reported: "I was told that this was a political move ordered for the purpose of showing to the French, British, Belgian and Russian officers that they were not natural Allies." The commandant of the Gardelegen camp tried to enforce the observance of this regulation during the height of the typhus epidemic at that camp, but his direct order was deliberately disobeyed by the British doctors, with excellent results.

Though this policy did not produce any ill effects upon the health of the prisoners in the officers' camps in Germany, its results, assisted by the insanitary condition of many of them, were disastrous in the main men's camps. Typhus is endemic in Russia, and the Russian prisoners, herded together with those of other nationalities, spread the disease till in some camps appalling epidemics were produced. At Ohdruf, Langensalza, Zerbst, Wittenberg and Gardelegen the fever raged with great virulence. At Wittenberg the camp was overcrowded and insanitary, the washing arrangements were nothing more than troughs in the open, which, with the supply pipes, were during the hard winter of 1914 frequently frozen. In these circumstances, a serious epidemic broke out in Dec. 1914. As soon as this was recognized, the whole German staff, military and medical, left, and never came inside again till Aug. 1915, by which time all the patients were convalescent. For his services in combating the epidemic Dr. Aschenbach, the German principal medical officer, received the Iron Cross. Many Allied and British medical officers had been improperly detained in Germany after their capture, and were dispatched to take the place of the German doctors, who (it is charitable to believe, in obedience to superior orders) had deserted their charges. In Feb. 1915, six British medical officers were sent to the camp which they found in a state of misery and disorganization. Of the six, three died of the fever, as did several French and Russian doctors. Notwithstanding the fact that there seem to have been ample supplies of medical necessities available, the difficulty of obtaining sufficient drugs and dressings was extreme. There was not even any soap till one of the British doctors obtained a supply at his own expense from England, nor, till April 1915, were beds or bedding for patients requiring hospital treatment improvised in one of the barracks. There were between 700 and 800 British prisoners among at least 15,000 in all, who, incredible as it may seem, were confined in an area not exceeding 10½ acres. Of the British about 300 were attacked by the disease and 60 died.

At Gardelegen the same story was repeated. As soon as it was apparent in February 1915 that something was wrong, captured medical officers were dispatched to Gardelegen, where the conditions were favourable for the propagation of disease. Though there were empty huts in the camp, the commandant refused to allow them to be used, and the prisoners' rooms were very overcrowded, the nationalities, as usual, being all mixed up together. To each company of 1,200 men was allotted for washing one outdoor trough, which was often frozen, and there was a small hut containing at the most thirty showers for 11,000 men. The place was bitterly cold, the heating arrangements entirely inadequate, consequently the huts were kept closed, and the atmosphere therein became foul. Four days after the arrival of the Allied medical officers every German had left the camp, and the commandant, standing outside the barbed wire, informed the medical officers that no person or thing was to pass out, and that they were responsible for the discipline and general internal arrangement of the camp, and for the care of the sick. Dr. Wenzil, the German principal medical officer, left the camp with the rest, but soon afterwards died of typhus. His two successors never came inside the camp. But the third, Dr. Kranski, a civilian, came in March and devoted himself seriously to the welfare of the camp, and, though he took no part in the care of the sick, did much to improve the sanitation, and in that way to aid the medical men in their work. It is unnecessary to go through the whole story of the struggles to obtain

the barest requisites in the way of food, drugs, dressings or furniture. The plague was stayed after four months, during which over 2,000 cases were treated out of 11,000 prisoners, the mortality being about 15% of those attacked. Of the 16 Allied medical officers, 12 took the disease and 3 died, while of 10 French priests, who devoted themselves to the care and nursing of the sick, eight were attacked and five succumbed.

The epidemics at Wittenberg and Gardelegen in these circumstances of gratuitous suffering and official callousness made a world-impression never likely to be entirely effaced, but it is only just to add that the German authorities, having learnt their lesson at the cost to others of so much suffering and death, did their best, too late indeed, to remedy the defects, and Gardelegen and Wittenberg eventually became, if not model, at all events fairly satisfactory camps.

*German Working Camps.*—In mines and large industrial places, there was generally a small sick-bay containing from two or three beds up to perhaps a dozen, in charge of a German Sanitater. There was no resident doctor, but a civilian practitioner called in well-managed camps daily, in others at intervals varying from twice a week to four weeks. In case of accident he was summoned as soon as the *Feldwibel* in charge thought fit. In the smaller camps reliance was placed simply on the local practitioner, which ordinarily was sufficient provision, though in some places, such as the large land reclamation camps in Hanover, the nearest doctor might live at any distance up to 20 kilometres. A prisoner seriously ill or injured was either taken to the hospital at the main camp to which his commando was attached, or sent to the local hospital, military or civil.

The real defect in the medical arrangements in these places was that too much power was left in the hands of the person in charge to decide whether a man reporting sick should see the doctor or not. The regulations in the II. Army Corps district provided that there must be a clinical thermometer in each commando, and the guard was to be instructed in the use of it. No prisoner was to be sent to work who had a temperature above 38° (100.4° Fahrenheit). This seems to have been construed as meaning that the prisoner was to be sent to work unless he could show that temperature. Armed with his thermometer the *Feldwibel* in charge often declined to allow the prisoner to see the doctor. The test was in some cases sufficient, in many it was no test at all, and the results were sometimes fatal.

*British Medical Arrangements.*—In the United Kingdom the arrangements for the treatment of sick and wounded prisoners did not differ in essentials from those made in Germany. At first there were no special hospitals for them, but in Sept. 1915 a large hospital was opened at Dartford. This accommodation, however, soon became insufficient, and at the time of the Armistice there were seven hospitals entirely set apart for prisoners. In addition to these large hospitals there was a hospital with beds to the number of about 2% of the prisoners, for the treatment of minor and urgent cases; while in the working camps the services of the local practitioner were given as required. In exceptional cases prisoners requiring special treatment were sent to an ordinary military or civil hospital.

*Repatriation.*—Closely allied with the matter of medical treatment is the question of repatriation and internment in a neutral country. As early as Jan. 1915, an agreement for repatriation of incapacitated officers was made. There was at first no agreement as to the degree of incapacity sufficient to entitle an officer to repatriation, but in August of that year an agreement was arrived at, which was slightly amended in October. It included 13 injuries or complaints entitling a person to be repatriated, which may be summed up as being such that the person was permanently, or for a calculable period, unfit for military service in the army, or in the case of an officer or non-commissioned officer, from service in training or office work.

But besides this direct repatriation of totally incapacitated persons, many prisoners were sent to Switzerland or Holland.

In the spring of 1916 an agreement was made with the German and Swiss Governments by which prisoners whose disabilities fell within an agreed schedule, but were not sufficient to

justify direct repatriation should be transferred to Swiss custody. They were selected by mixed travelling boards composed of Swiss medical men and medical officers of the captor State, those selected being afterwards examined by a Control Board, whose decision was final. After the Conference at The Hague in 1917, these travelling boards were abolished, and the first selection made by the camp medical officer, an arrangement subsequently modified at the meeting of 1918.

The guiding principles for internment in Switzerland were stated in 1917 as follows:—

"The following shall be interned:—(1) Sick and wounded whose recovery may be anticipated within a year, and whose cure will be more speedily and surely brought about by the facilities obtainable in Switzerland than by a prolongation of imprisonment. (2) Prisoners of war whose health in the opinion of the medical authorities appears to be seriously menaced either physically or mentally by the prolongation of captivity, and who would probably be saved from this danger by internment in Switzerland."

If the person's disabilities increased so as to bring him within the category entitled to direct repatriation, he was to be sent home.

In 1917 the Netherlands Government offered to receive in all 16,000 persons, British and German, divided into three categories: (1) invalid combatants (7,500); (2) officers and non-commissioned officers who had been in captivity for 18 months (6,500); and (3) invalid civilians (2,000). This offer formed the basis of the agreement made between the British and German Governments at The Hague in June 1917. By that agreement the schedule of disabilities for the invalids was the same as in the case of Switzerland, except that the British Government insisted with the assent of Switzerland that tuberculous patients should go to that country. Much resentment was felt in consequence of the exclusion of privates who had been 18 months in captivity from the benefit of this agreement. But the British delegates were powerless. Every attempt to induce the German delegates to agree to their inclusion was vain.

The provisions of the agreement arrived at in 1917 were largely extended at a further meeting in 1918, by which all warrant and non-commissioned officers, as well as men who had been prisoners of war for more than 18 months, should, with exceptions, be repatriated, head for head and rank for rank.

*General Treatment.*—So far an attempt has been made to show how the principal articles of the Hague and Geneva Conventions relating to prisoners of war were applied in Great Britain and Germany during the World War. It remains to be considered how far the over-riding principle laid down in Article 4 of the Hague Convention was observed. That article requires first, that prisoners must be treated with humanity; and second, that all their personal belongings, except arms, horses and military papers, shall remain their property.

With regard to the second requirement charges were made against both armies that this obligation was not observed, and it cannot be doubted that on both sides the wounded were sometimes on their first capture relieved of valuables. But this was not due to any official action; it was due to the unauthorized and wrongful acts of individuals. In respect of one matter only was there anything which could be treated as an authorized disregard of this article. British prisoners often had their boots taken from them by the Germans, either at first capture or later even in the camps in the interior of Germany. This was justified by the Germans on the ground that a man's boots were as much a part of his military equipment as his arms, and that therefore they were entitled to take them away. This claim seems only specious; the practice it sought to support or excuse certainly had the most cruel results in many cases, as men were forced to go about without any covering on their feet, or, if the boots were replaced, as they sometimes were, by wooden clogs, the men suffered much, especially during the winter or in mines from that unaccustomed footwear. However, in other respects this part of the article appears to have been fairly observed, though a somewhat liberal construction was placed on the expression "military papers" by both sides.

We turn now to the other part of the article, which enjoins that the prisoners must be treated with humanity. There existed during the war much misconception with regard to the

treatment of prisoners in Germany, partly owing to the fact that only stories of horrors were published in England and the Allied countries, partly owing to the prominence given to this subject as a method of Allied war-propaganda, in the dramatic form of cinematograph films, and notably in the pictures relating to the work of Mr. Gerard, the American ambassador.

Some of the stories thus circulated were untrue. As an instance, it may be recorded that every story as to the tattooing of prisoners by the Germans, to which great prominence was given, pictures of the alleged victims being produced in the cheap illustrated papers, was, as far as possible, carefully investigated and was in no case shown to have any foundation. But the stories had their effect, for an idea got abroad that a prisoner once in the hands of the Germans was subject to every kind of indignity and cruelty.

It is possible now to weigh all the evidence, and express a judicial conclusion unaffected by the passions of war. The materials for doing so are ample. In the summer of 1915 a committee, presided over by Lord Justice Younger, was appointed by the British Government to enquire into the treatment by the enemy of British prisoners of war. As far as possible, each escaped or repatriated prisoner was examined by a person experienced in taking evidence, and arrangements were also made by the committee for examining the prisoners interned in neutral countries. In all, over 3,500 persons who had been prisoners in Germany, including 445 officers and 90 medical officers, were examined by this committee during the war, and most of their statements were printed and all indexed. After the Armistice the committee was asked to arrange that every returned prisoner should have an opportunity of making any complaint he wished. A questionnaire was carefully prepared and handed to every returned prisoner on his arrival at one of the dispersal camps to which all prisoners were sent before being allowed to return home. Each company of returning men was addressed by the person in charge of the investigation, and he impressed on the men the importance of stating frankly whether there was any complaint that they desired to make, and, if so, what it was. The result was remarkable. Out of not less than 170,000 forms issued only some 59,000 were even returned, and of these only about 22,000 contained information of any value whatever.

While this information was being collected, the then Attorney-General, Sir F. E. Smith (afterwards Lord Birkenhead), appointed a further committee to enquire into the breaches of the laws of war, the sub-committee dealing with prisoners being under the presidency of Mr. Justice Peterson. This sub-committee carefully considered the whole of this mass of evidence, and, in addition, the reports, nearly 2,000 in number, of the American and Dutch representatives who visited the camps. The German military law was also carefully studied.

Information was thus obtained with regard to 57 camps for officers and 78 main camps for men, besides the working camps, the number of which, shown by lists (admittedly not quite complete) from time to time furnished by the German authorities to the Netherlands minister, was 7,157. There were certainly not less than 7,500 places in all where one or more British prisoners were at one time or another confined, in addition to the camps on the eastern and western fronts, which are left for separate consideration.

The result of the investigation was that complaints, some uncorroborated, some trivial and some very serious, were received as regards 929 places, in only 349 of which—rather less than 5% of the whole—did a first study of the evidence seem to call for further examination.

It is clear, therefore, that no general charge of inhuman treatment is well-founded; it is, however, true that, apart altogether from the camps on the eastern and western fronts, there were actually, if not proportionately, a large number of cases in which the German treatment of British prisoners was certainly bad, and, in some cases, very bad.

To form a just estimate of the gravity of the situation so disclosed, consideration must be given to the differences of the

military law and disciplinary practice of the two countries, and to the personal characteristics of the two peoples. With regard to the former, it is not necessary to repeat what has been said before about the severity of the German military law, and in actual practice the officers and non-commissioned officers in the German army are accustomed, apparently without lawful authority, to ill-treat their men physically in a way which would not be tolerated in England. Moreover, the German is naturally more amenable to strict discipline than the average Briton. Much of the ill-treatment complained of in the camps resulted from one or other of the causes above indicated; for the rest a disregard of the German military law or the regulations made for carrying that law into force was the main contributing cause.

In this connexion the attitude of the civilian population cannot be ignored. The anger aroused by the entry of Great Britain into the war induced on the part of German men and even German women cruelties which any decent person must look upon with disgust. It was inevitable that the passage of wounded prisoners from the battle-front to the interior of Germany should be attended with suffering. But that men grievously injured should be subjected to insults and physical ill-treatment is horrible, and that women bearing the Red Cross should throw water on men crying in agony for a drink, or should show to famished men soup and then pour it on the ground rather than allow them to partake of it is conduct almost incredible in its brutality. But such things occurred, not once or twice, but frequently in the early months of the war, and even later the conduct of civilians outside the prisoners' camps is worthy of the severest condemnation. Happily, however, passions were allayed, and after the first year of the war prisoners passed through from the front without being subjected to the insults and ill-treatment which unhappily were common at first.

Again, it was inevitable that, owing to the state of unpreparedness and want of experience of all the belligerents, much discomfort and suffering should be caused to those captured early in the war. This is passed over as being practically unavoidable, and in what follows, unless otherwise clearly stated, the conditions recorded are those after the organization was or ought to have been fairly complete.

*Officers.*—The treatment of officers in a camp depended very much on the commandant, and, to some extent, on the personality of the general of the army corps district in which the camp was situated. As officers were under no obligation to work, one grievance which was so fruitful a cause of trouble in the men's camps did not exist in their case.

In some camps where, as at Crefeld, the commandant was a gentleman, no valid complaint can be made of the treatment. In others, especially in the X. Army Corps district, where the malign influence of Gen. von Hänisch was paramount, some of the commandants were neither gentlemen nor capable of understanding the feelings of gentlemen, and there was continual trouble. At Clausthal and Holzminden, of which the two brothers Niemeyer were commandants, the state of affairs was intolerable. There were continual arrests for trivial offences and endless pinpricks on both sides. But, worse than this, the guards had orders to use their bayonets and rifles without adequate cause. On one occasion an officer, for looking out of a window, was shot at by order of the commandant at Holzminden, but fortunately not hit. At Strohen, another camp in this district, two officers were seriously wounded in a bayonet charge ordered personally by the commandant because a knot of them had gathered near a prohibited part of the camp.

One matter gave rise to much resentment. It was right and proper for the Germans to make occasional strict searches in view of the continual attempts to escape; but their method of carrying them out with detectives from Berlin assisted by police dogs which prowled round the completely stripped officers was offensive in the extreme.

But these were exceptional places and incidents. In general, the officers commanding were gentlemen, who treated their charges with courtesy and consideration, though in most cases there was occasional friction owing to the propensity of the

young officers to attempt to escape, and, in some measure perhaps, owing to the inability of German officers to understand the exuberance—even in captivity—of British subalterns.

*Men in the Main Camps.*—In the main camps the treatment on the whole seems to have been reasonable, and in some cases more considerate than might have been expected. There was the usual trouble from the enforcement of a discipline far more severe than that to which the prisoners had been accustomed in their own army; from the violence with which the German non-commissioned officers treated offending prisoners, and, up to quite late in the war, from the use of savage police dogs in the camps, which the German Foreign Office declared to be "a military necessity, in view of the large number of prisoners of war in Germany," adding that, "having regard to the inferior number of prisoners in England no comparison can be drawn between conditions in the two countries." Trouble, and even loss of life, was caused by the too frequent use of firearms in some camps, as, for instance, at Wittenberg, where on one occasion men were ordered to return to their huts on a given signal and the laggards were fired on. But such incidents were not general, and occurred only in camps where the commandant was quite unfit for his post. In most cases the prisoners were treated fairly, if strictly; in a few, of which Friedrichsfelde may be taken as an example, at all events in its later stages, everything seems to have been done to make the prisoner's lot as little irksome and unpleasant as possible. An exception must be made in the case of Langensalza, where the treatment was from first to last rough in the extreme, a roughness which culminated just after the Armistice in the shooting by the guard, hurriedly called upon the scene, of a number of prisoners who were pulling down a building, a proceeding condemned by the German Court of Enquiry as a breach of Article 4 of the Hague Convention.

*Working Camps.*—Still leaving out of consideration the camps in the occupied districts on the eastern and western fronts, the great bulk of the ill-treatment occurred in the working camps, and by a curious paradox, it is in them that the best treatment is to be found. The ill-treatment was due to two main causes: first, to the fact that, except in very large working camps, the person in charge was a non-commissioned officer, and, second, to the passive resistance and in some cases the active insubordination of the British prisoners.

The non-commissioned officers, trained in the school of the German army and unrestrained by the presence of a superior officer, treated the prisoners in the way in which the rank and file of the German army have so often been treated. Men who refused to work, or in the opinion of the guards did not work hard enough, were kicked, spat upon, beaten with sticks, whips, clubs, rubber tubing, mining hammers and the butts of rifles. Those who escaped and were recaptured not infrequently received severe beatings before they were reported as recaptured and were formally punished for their offence. And all this was done notwithstanding the regulations, which, after laying down rules in the main reasonable enough for the use of arms by the guard, continue as follows (the quotation is from the instructions in force in the II. Army Corps district):—"Blows with the hand or fist or with sticks or clubs and kicks are forbidden. Except in the most exceptional and unusual cases it is inexcusable to lay hands on a prisoner."

Even where the non-commissioned officer was lawfully inflicting punishment, he would often by his perverse ingenuity add to its severity. Men were made to stand at attention on hot asphalted roofs, or before coke ovens, where they were nearly roasted, or sometimes in exposed positions without an overcoat in the freezing atmosphere of a winter's night. At more than one mine, the dark cells, in which, according to the German law, prisoners of war under punishment were obliged to pass their periods of close arrest, were constructed in close proximity to the main steam pipe and became so hot that the men had to strip themselves almost to the skin.

For all this there is no excuse or palliation possible; happily, however, there is another side to record. At some large German works the employers seem to have taken a real interest in their

prisoners, and to have done whatever in them lay to make their lot endurable and even comfortable.<sup>1</sup> On the farms and similar places, the relations between prisoners and their employers were frequently, as in Great Britain, even cordial, and more than one repatriated British prisoner has spoken warmly of the kindness and consideration with which he was treated, though such cases were, of course, not common.

The impression produced by the study of all the available material is that there was neither in the main nor the working camps in Germany any officially recognized ill-treatment of prisoners; that there was, nevertheless, in many cases much cruelty by individuals, and that when as occasionally, but far too infrequently, happened, a prisoner could bring home to the authorities that some individual had exceeded his powers and acted outside the regulations, the offender was punished, sometimes by being sent away to the front, sometimes by a sentence to a term of imprisonment. On the other hand, it is also clear that in some cases the prisoners were treated, not only with humanity, but with kindness.

The reason for these contrasts is to be found in two things. First, the personal character of the man in charge, and, second, the independence of the army corps commanders, and even to some extent of the camp commandants, who not only placed their own interpretation on the regulations, but sometimes acted in deliberate defiance of them.

*Men in the Occupied Districts.*—While the above represents the considered opinion which results from the study of the very voluminous material available with regard to the camps in the interior in Germany, the same conclusion cannot be reached when the evidence dealing with the camps in the occupied districts is examined.

The cruelties inflicted on the prisoners in these places had their origin, and from the German point of view, their justification, as reprisals for alleged ill-treatment of Germans in British hands. It is not proposed to give here an account of the reprisals enforced on one side or the other, more than to allude to the severe conditions under which the first captured German submarine officers were interned in Great Britain, which resulted in the German Government retaliating by selecting from among the officers in their hands who bore well-known names (including among them the son of the former British ambassador to Berlin) and imprisoning them under exceptionally rigorous conditions. Most of the reprisals, while unpleasant enough for the victims, were not such as to amount to real cruelty.

But it is not too much to say that the treatment of the prisoners of war on the eastern and western fronts must, so long as the terrible story is remembered, bring indelible disgrace on the German nation, and on those responsible for the appalling cruelty inflicted on defenceless men. It was quite deliberate, as the following facts will show.

*Eastern Front.*—In the spring of 1916, German prisoners of war were sent to work at Rouen and Havre, and in May the German Government informed the British Government that it had in consequence decided to send 2,000 British prisoners to the occupied Russian territory to work under similar conditions to those existing at Havre and Rouen. They were accordingly sent, divided into four companies of 500 each, to four main camps, from which they were sent in smaller parties to work on numerous farms and in road-making and tree-felling. There is no serious complaint to make of the central camps, but at the others the conditions were very hard, the accommodation bad, and the *unter-offiziers* rough.

On Feb. 7 1917, the British Government received a German *note verbale* in which complaint was made that a considerable number of Germans were detained behind the British front in France, where it was alleged the "prisoners suffered from inadequate food, defective accommodation as well as being subjected to hard work and irregularities in the matter of mails," and that they were exposed to German gunfire which "has resulted in several of them being killed." The Germans re-

quired that their men should be removed to a distance of at least 30 km. behind the firing-lines and "provided there with accommodation in accordance with the season of the year and hygienic needs." In default of the British Government notifying their compliance with these demands by Feb. 1 (the *note verbale* was dated Jan. 24 and received on Feb. 7), "a number of British prisoners will be transferred from camps in Germany to the area of operations in the western theatre of war where, in respect of employment, accommodation, food, and the question of mails, they will be treated in a manner corresponding to the practice of the British military authorities"—which means, of course, the practice alleged by the Germans, *i.e.* insufficient food, defective accommodation (only tents), hard work and irregular mails.

The British Government, in a *note verbale* for transmission to the German Government, dated Feb. 8 1917, gave the explicit assurance that the prisoners received the same food as the British troops, that 75% were in huts, the remainder being like many British troops in specially warmed tents with floor boards, that strict orders had been given against their being employed within the range of German gunfire though it was regretted that one man had been wounded by a shell which must have been fired at exceptionally long range, this being the only casualty which had occurred.

Within ten days of the date of the British reply, 500 men were sent, not to the western but to the eastern front, and they were "officially informed" that they would be sent to the trenches between Riga and Mitau and remain within the artillery zone by way of reprisal. On Feb. 25 these 500 men were forced to march 35 km. up the frozen river Aa, often through snow-drifts knee deep. Sledges followed to pick up the men who broke down from exhaustion, while the escort of Uhlans drove the stragglers on with lances and whips. Those who fell were robbed of their kit and property. Of the 500 who started, between 120 and 130 are said to have collapsed on the march. "They were brought in by transport later, but through their lying in the snow they were frost-bitten in the hands and feet."

Arrived at their destination, the men were kept waiting outside a "cavalry tent built on the ice of (marsh by) the river. It had wire beds on three racks, the bottom one being about one foot from the ground, so that the weight of a man's body weighed it down till he was lying on the snow or the ice."

The next morning they were paraded, and a notice was read out giving the reasons why they were there. The substance of this notice is given by one of the British prisoners who heard it, as follows:—

"You are here on a reprisal because the English have German prisoners working in the firing-line in France. They have bad accommodation, bad food, bad treatment; they are under fire and 36 men have lost their lives. In return, you are to work here in the firing-line and will get bad treatment, bad food, bad accommodation, and 36 of you have got to die."

The way in which it corresponds with the substance of the *note verbale* of Jan. 24, already quoted, which the soldier who gave the evidence could not possibly have heard of, cannot escape notice, any more than the fact that the accommodation provided corresponds with the complaint that some of the Germans at Havre and Rouen were lodged in tents.<sup>2</sup>

The threats contained in the notice were carried out to the letter. The accommodation was bad, the treatment was bad, the food was bad, and numbers of men died, while more lost toes, fingers or hand through frost-bite.

The tent was a large cavalry tent pitched on the frozen marsh, with a foot or more of snow and ice inside and frequently under shell-fire. There were some small stoves, but no fuel or entirely inadequate fuel was provided. The "revier Stube" was a wretched peasant's cottage (in which the guard also was quartered) in charge of a brutal Sanit ter. Men in the last stages of illness were sent by sledge to Mitau. When the thaw

<sup>1</sup> In some places the prisoners were even taken periodically to the local cinema, not always at their own expense.

<sup>2</sup> When the men had been in this place for a week the "German Government informed the Netherlands minister at Berlin, in a *note verbale* dated March 5, that British prisoners of war had not yet been sent quite close to the German firing-line on the Russian front."

came the tent was moved to Pinne, on the other side of the river, where deep mud took the place of snow and ice inside the tent.

There was no water supply; such water as there was, was obtained by melting ice from the river or by digging down into the marsh, where filthy polluted water was obtained. Most of the men had no wash during the whole time they were there. The treatment was bad. Were it not established beyond the possibility of doubt, the story would be unbelievable. Men were driven out to work—breaking ice on the river, felling trees, making and repairing trenches under fire—when they could hardly stand, and had to be supported by their comrades to and from their work. One man died while being carried home; another, who had fallen exhausted on his way back to camp, was shot at point-blank range by the sentry; while a third man, who did not turn out quick enough one morning, was first abused and then attacked with a bayonet by the Sanit  ter; further investigation disclosed the fact that he had been dead some hours, frozen in his bunk. The only punishment was tying to the post outside the tent for two hours after the men returned from work, under conditions hardly differing from crucifixion. A sergeant-major, having been urged by the interpreter to write home how they were being treated, eventually did so: "next day," he proceeds, "I got the letter back marked 'five days strong arrest.' After being hard at work from 6 A.M. to 6 P.M., I was tied to the pole from 7 P.M., during 36 degrees of frost." This is corroborated by several witnesses.

That this treatment was deliberate and inspired by higher authority is evident from the fact that the sergeant-major says he obtained a copy of the orders from the guard, which stated "that no mercy was to be shown to us; we were men who had, every one of us, assisted in stopping the Kaiser's army from going to Paris; and they were to think of their comrades who were being brutally treated in France. Any soldier failing to carry out these orders was to be severely punished."

The guards were given three-quarters of a loaf each day, the prisoners, doing hard work, received one-sixth of a loaf. The guards were given good, thick soup; the prisoners, soup "that you could drink straight off." To such straits were the men reduced that it is recorded by more than one witness that the men became so ravenous that they would eat anything. "There were," says one, "many unburied Russian bodies lying round the camp. Some men were so reduced that when they saw any bones they would rush at them and eat them like a dog. It was pitiful to see men reduced to such an animal stage." No parcels were allowed before April, and no letters. When the remnants of this unhappy company returned to Mitau, 20,000 parcels were found stored. Had they been forwarded much suffering might have been avoided and lives saved.

The result of this inhuman treatment was what might have been expected. At the end of April 1917, there were 77 men left in the camp out of the 500 driven there in February. Of these, no fewer than 47 were certified by the German doctor as unfit to leave their beds. No less than 23 had died from exposure and starvation—some 16 in the camp, the rest in hospital at Mitau, besides those killed by the sentries or permanently injured by shell-fire or frost-bite.

There can be no doubt whatever that the sufferings endured by this unfortunate 500 were directly due to someone in authority in Berlin. The terms of the notice read out to the prisoners and of the orders given to the guard are in exact accordance with the terms of the *note verbale* of Jan. 24 1917.

*Western Front.*—The story of the treatment of the prisoners on the western front is not less terrible, indeed in some respects it is worse in that their sufferings were more prolonged, though they were not exposed to the same climatic conditions as their comrades in Russia. There is overwhelming evidence in this case also of the deliberation with which the suffering was inflicted.

In April 1917 it was agreed, after the communications of January and February mentioned above, that neither belligerent would employ prisoners within 30 km. of the firing-line, and on April 28 a telegram was sent by the British authorities informing the German Government that orders had been issued

that all German prisoners were to be removed. On May 30 a further telegram was sent stating that they had all been withdrawn to a distance of 30 km. from the firing-line, and requesting immediate information that the British prisoners had been so withdrawn on the eastern and western fronts. No reply was received till July 4, when the British minister at The Hague transmitted a communication from the German Government stating that "there can be no question in any case of intentional retention or concealment of British prisoners," and on July 9 a further communication was received, dated Berlin June 15, saying "that the withdrawal of British prisoners of war in the German fighting zone to a distance of 30 km. behind the firing-line has been completed everywhere."

On July 2 the British and German representatives at The Hague had made the following important agreement:—

"Reprisals against combatant and civilian prisoners of war may only be carried out after at least four weeks' notice of intention so to do has been given"; and second, "all captures are to be notified by the captor State to the other State with the least possible delay; every prisoner captured is to be allowed to communicate at once with his family and is to be provided with the means of doing so and the dispatch of his communication is to be facilitated: as soon as practicable after capture every prisoner is to be enabled to inform his family of an address at which they can communicate with him."

The statements with regard to the removal of the prisoners were not true. From early in 1917 up to the Armistice prisoners were kept by Germans within 30 km. of the front line and were there subjected to the most cruel treatment. After the above-mentioned agreement, and up to the date of the German offensive of March 1918, their number was probably not large, but after that date thousands were so detained under very bad conditions. No notice of the fact that they were to be so detained as a reprisal was ever given to the British Government.

In April 1917 a notice entitled "Conditions of respite to German prisoners" was handed at Lille to a British noncommissioned officer to be read out to his fellow-prisoners. It runs as follows:—

"Upon the German request to withdraw the German prisoners of war to a distance of not less than 30 km. from the front line, the British Government has not replied; therefore it has been decided that all prisoners of war who are captured in future will be kept as prisoners of respite (*sic*). Very short food, bad lighting, bad lodgings, no beds, and hard work beside the German guns under heavy shell-fire. No pay, no soap for washing or shaving, no towels or boots, etc."

The notice proceeds to the effect that prisoners are to write home of their sufferings and that "no alteration in the ill-treatment will occur till the English Government has consented to the German request" and then the prisoners would be removed "to camps in Germany, where they will be properly treated, with good food, good clothing." Stationery would be supplied and "all this correspondence in which you will explain your hardships will be sent as express mail to England." Similar notices were read out at several other places. The threats were carried out to the letter. The accommodation was everywhere and always as bad as it could be. In the spring of 1917 prisoners were confined at Lille in conditions comparable only to those of the "black hole" of Calcutta, the crowding was terrible, there were no washing arrangements, and the only sanitary accommodation took the form of tubs in the rooms. The same conditions were renewed or continued in 1918; in the spring of that year the men were told that they were being badly treated as a reprisal. Prisoners were sent to places behind the lines, where they had to work for eight or nine hours on end and even longer on entirely insufficient food. The evidence of over 2,300 men has been obtained with regard to 78 of these places, at 20 of which they were exposed to Allied shell-fire which caused many casualties, while at 38 they were engaged in work directly connected with the operations of war, being required in some cases actually to take up ammunition to the German guns. They were forced to do this by brutal ill-treatment, and were worked till they could do nothing more and either died or were sent back to Germany mere wrecks of their former selves. Men died in the train, their bodies being taken out at stations on the way; many more died within 24 hours of their arrival at the

hospital to which they were sent, and often a large percentage (up to 30 % it is said in some cases) within the next three or four weeks. Their physical condition is vouched for by 33 medical officers who were prisoners: 10 of them immediately behind the lines who saw what was going on, and the remainder detained in the interior of Germany who saw and tended the prisoners on their arrival there.

The under-feeding of the prisoners on this front was aggravated by three things: First, the Germans did not notify the capture of large numbers of them in obedience to the Hague agreement of 1917; second, the prisoners were forced to give as their address some camp in the interior of Germany to which parcels were sent for them and, except in a few cases, not forwarded; third, steps were taken to prevent the French and Belgians giving the prisoners any food.

The *Kommandantur* at Mons on April 4, 1918 issued a notice in French of which the following is a translation:—

"Conversation with prisoners is absolutely forbidden, as is giving them letters, food, or anything else. Breaches of this regulation will be punished by imprisonment for a maximum of three years or a maximum fine of 10,000 marks."<sup>1</sup>

This was repeated on July 28 and on Sept. 9, 1918 the *Kommandantur* again called attention to the matter, the notice of the latter date containing a passage of which the following is a translation:—

"Notwithstanding this warning, frequent breaches of the regulation have been reported. The *Kommandantur*, being responsible for strictly maintaining order, has instructed guards to use their firearms when it becomes necessary so to do."<sup>2</sup>

This was no mere threat. Many civilians, women among them, were shot for attempting to help the starving prisoners, and many prisoners were shot on the spot even for attempting to pick up the remains of food which they saw in the road as they marched along.

This treatment was continued right up to the Armistice, when prisoners in the last stages of exhaustion and starvation stumbled into the British lines hardly recognizable as British soldiers. The High Command had faithfully kept their promise of "very short food, bad lighting, bad lodgings, no beds and hard work beside the German guns under heavy shell-fire."

**PRISONERS OUTSIDE EUROPE.**—Something must be added with regard to the treatment of prisoners elsewhere than in Europe, if only because serious complaints were made on both sides as to their treatment with regard to accommodation and food, especially in East Africa. There can be no doubt that much suffering was endured by prisoners of both nationalities in this part of the world; but it was mainly due to the conditions of the campaign and to the climate, while on the British side there appears to have been much justification for the complaints which were made against individual Germans for their want of consideration for the devoted men and women missionaries whom the fortunes of war had brought into their hands.

**Turkey.**—Little can be said with regard to the application of the Hague Convention by Turkey, because the Government of that country made practically no attempt to conform to the regulations contained in it. Their treatment of prisoners varied from an almost theatrical politeness to the great, to complete indifference to suffering—almost to barbarism—in the case of men of little esteem.

These oriental characteristics may be best illustrated by the fate of the British prisoners captured on the fall of Kut el 'Amara at the end of April 1916, when, as Enver Pasha stated, they became "the honoured guests of the Turkish Government." The

officers were sent by steamer to Bagdad and thereafter drafted to various camps in Anatolia. The men were marched 100 m. to Bagdad, in stifling heat, with no sort of organization for food transport or medical care of those worn out by the privations of the long-drawn-out siege. The Turkish commandant promised that the day's march should not exceed eight miles. He kept his promise for one day, and thereafter the men were forced to march from 12 to 18 m. a day, herded like sheep by mounted Arabs who flogged forward the stragglers. At night they lay out on the open ground without any shelter. Many fell out and died. At one point 350 men were left behind in a sort of cowshed, so sick as to be unable to move, and were picked up by the already overcrowded boats, where there was room only for the most desperately ill to lie down. Arrived at Bagdad, all but 500, who were too ill even for the Turks to force them forward, were sent on a 500-m. march to places where they were to work.

Out of a total of 13,670 of all ranks believed to have been captured at Kut, in the course of two and a half years 1,425 escaped or were repatriated, 2,611 are known to have died, while 2,200 were missing, and there were left in the hands of the Turks only 7,414, or little more than half of those captured.

Up to Dec. 1917 the Ottoman Government steadily refused to permit neutrals to inspect the camps, and though this concession was then made, it was so worded as in effect to be useless.

**Bulgaria.**—If due allowance is made for the backward condition of the country, it must be admitted that the treatment by the Bulgarians was correct, though complaint was made that British soldiers were flogged for disciplinary offences. This is permitted by the military law of Bulgaria but after representations were made on the subject the practice was abandoned in the case of British soldiers.

The food given the prisoners was the same as that given to the Bulgarian soldiers, and the hospital treatment was not less good than that given to their own men. The accommodation was rough but in general no worse than that of the inhabitants of the country. Every effort appears to have been made to improve conditions where they were remediable, and the authorities seemed anxious to treat their British prisoners with consideration. An unusual amount of liberty was accorded to the prisoners, and there is no little evidence of the kindness and friendliness of the Bulgarian civilians to the British.

**Austria.**—The few British prisoners captured by Austria were treated with consideration and in accordance with the provisions of the Hague Convention.

**NEGOTIATIONS DURING THE WAR.**—During the World War a notable step was taken in arranging for meetings between representatives of the belligerents for the discussion of matters relating to prisoners of war. In the spring of 1917 meetings had taken place between French and German representatives with useful results, and largely owing to the insistence of Lord Newton, who was then in charge of the Prisoners of War Department of the British Foreign Office, a meeting between German and British representatives was arranged and took place at The Hague in June. Great Britain was represented by Lord Newton, Lord Justice Younger and Gen. Belfield, and Germany by Gen. Friederich and two others, the meetings being presided over by M. van Vredenburg on behalf of M. Loudon, the Netherlands Minister of Foreign Affairs. At this meeting arrangements were made for the repatriation of disabled combatants, for the internment of invalid interned civilians, for the repatriation of medical personnel still retained by the belligerents, and for the mitigation of certain punishments inflicted on prisoners of war. It was agreed that reprisals should only be carried out after a month's notice of intention to do so had been given and it was also agreed that all captures were to be notified with the least possible delay.

This meeting was followed by one which lasted from June 8 to July 14, 1918, at which the British representatives were Lord Cave, Lord Newton and Gen. Belfield, the first-named being obliged to return before the agreement was signed. It contained no fewer than 60 articles with six annexes thereto, and dealt with the following subjects: the repatriation of invalids;

<sup>1</sup> The original wording was:—

"Il est absolument interdit de parler aux prisonniers ou de leur passer des lettres, des vivres, ou d'autres objets quelconques. Les infractions à cette prescription seront punies d'un emprisonnement pouvant s'élever à 3 ans, ou d'une amende pouvant atteindre 10,000 mark."

<sup>2</sup> The original wording was:—

"Malgré cette défense, de nombreuses infractions ont été signalées. Le Kommandantur ayant pour tâche de maintenir l'ordre le plus strict, les soldats de surveillance ont reçu l'instruction de faire usage, le cas échéant, de leurs armes à feu."

the internment in a neutral country of prisoners who had been a long time in captivity; the protection of prisoners after capture; prisoners retained in an area of operations; notification of capture; equipment and organization of camps; food; punishments; help committees; relations with protecting powers; parcels and postal services; and the publication of the agreements in the different camps. Much was done by these two meetings to translate into a concrete form the principles laid down in the Hague Conventions, and to mitigate the lot of the prisoners, though the full benefit of the second agreement was never realized as it was never formally ratified.

In Dec. 1917 Lord Newton and Gen. Belfield met Turkish representatives at Berne under the presidency of M. Ador, of the Swiss Political Department, and an agreement was drawn up on lines similar to those of the German agreements.

**QUESTIONS FOR THE FUTURE.**—The foregoing investigation of the operation of the Hague Convention during the World War leads one inevitably to ask whether it is desirable and practicable to make any substantial amendment to that Convention. It is a most difficult question to answer, for, although not generally recognized, the whole problem is military rather than humanitarian. While of course all active ill-treatment should be prohibited, the lot of a prisoner must not be made so attractive in comparison with that of soldiers in the firing-line as to afford a temptation to them to desert or to do anything incompatible with their military duty. Further, while it is possible for the voices of humanity and charity to make themselves effectively heard in times of profound peace, it is useless then to formulate regulations which public opinion, stirred to its depths by alleged misdeeds of the enemy, will not allow to be observed, and which the military authorities will disregard in time of war. All that can be usefully accomplished is to put into the form of rules those principles which the good sense of all civilized nations accepts as correct, and for this purpose to use the experience gained during the World War, of which not the least important part was the value of direct conference between representatives of the belligerents during active hostilities for the purpose of dealing with the detailed application of those principles.

But it does seem desirable that regulations should be made dealing with the case of civilians found in any enemy country at the outbreak of war, for it is improbable that in any future war of nations civilians will be allowed to return home or to remain at large in view of the means of communication which modern science has made possible.

The value of the inspection of prisoners-of-war camps by the accredited representatives of the protecting State has been made abundantly clear, and their right to visit the camps, which was the result of an agreement made early in 1915 between the British and German Governments should be made permanent. It will, however, be extremely difficult to reconcile the desires of the humanitarians and the military authorities with regard to camps within the area of hostilities, though it will probably be found possible to come to some agreement defining the nature of the work on which prisoners of war may not be employed, and an attempt should be made to make more clear than it is at present the obligation of the captors with regard to the feeding and clothing of the prisoners in their hands.

For military reasons there would be no chance of obtaining a general assent to the prohibition of reprisals, but provisions similar to those contained in the agreements with the German and Ottoman Governments requiring notice before reprisals are made might be accepted.

Finally, those agreements made during the war with regard to the repatriation of disabled prisoners, and the conditions on which a prisoner should be entitled to internment in a neutral country if accommodation could be found, might be made of universal application.

There remains the most difficult question of all: whether it is possible to provide penalties for the infraction of any regulation which may be made, and to establish a tribunal with authority to punish individuals and States. Articles 227-229 of the Peace Treaty with Germany, satisfactory from one point of view,

savour too little of the calm administration of justice. They are not reciprocal, the vanquished are given no right to have judicially investigated any complaints they may have against the victors. It would be far more satisfactory to have an alleged "atrocity" investigated than that, for want of public investigation, an unfounded legend of brutality should grow up.

It is perhaps too much to expect that, at the conclusion of a war in which the victors have made great sacrifices and undergone great suffering, they should take steps to establish a court for the trial of charges against their own people, but if provision had been made in time of peace for the establishment of a court to investigate all charges of wrong treatment in time of war the victors would not depart from their agreement. The establishment of such a court may well occupy the attention of statesmen and international lawyers.

**AUTHORITIES.**—The following is a complete list of official publications:—Correspondence between H.M. Government and the U.S. ambassador respecting the treatment of prisoners of war and interned civilians in the United Kingdom and Germany: Misc. 7 (1915), cd. 7817; do. Misc. 5 (1915), cd. 7815. Reports by United States officials on treatment of British prisoners of war and interned civilians in Germany: Misc. 11 (1915), cd. 7861; Misc. 3 (1916), cd. 8161; Misc. 14 (1915), cd. 7959; Misc. 15 (1915), cd. 7961; Misc. 19 (1915), cd. 8108; Misc. 16 (1916), cd. 8235; Misc. 26 (1916), cd. 8297; Misc. 7 (1917), cd. 8477. Report on conditions existing at Ruhleben: Misc. 13 (1915), cd. 7863. Report by Dr. A. E. Taylor on the conditions of diet and nutrition at Ruhleben: Misc. 18 (1916), cd. 8259; Misc. 21 (1916), cd. 8262. The same, and on proposed release of civilians: Misc. 26 (1916), cd. 8290; Misc. 35 (1916), cd. 8352. Correspondence respecting the employment of British and German prisoners of war in Poland and France respectively: Misc. 19 (1916), cd. 8260. Correspondence with U.S. ambassador respecting transfer to Switzerland of British and German prisoners of war: Misc. 17 (1916), cd. 8236. Reports of visits of inspection made by officials of the United States embassy to various internment camps in the United Kingdom: Misc. 39 (1916), cd. 8324. Report on the treatment of prisoners of war in England and Germany during the first eight months of the war: Misc. 12 (1915), cd. 7862. Report on the transport of British prisoners of war to Germany Aug.-Dec. 1914: Misc. 3 (1918), cd. 8984. Report on treatment of British prisoners and natives in German East Africa: Misc. 13 (1917), cd. 8689; do. London 1918. Correspondence with German Government respecting the burning of G. P. Genower, A.B.: Misc. 6 (1918), cd. 8987. Correspondence respecting the use of police dogs: Misc. 9 (1917), cd. 8480. Agreement between the British and German Governments concerning combatant and civilian prisoners of war: Misc. 12 (1917), cd. 8590; do. Misc. 20 (1918), cd. 9147. Report on the treatment of British prisoners of war in Turkey: Misc. 24 (1918), cd. 9208. Agreement between the British and Ottoman Governments respecting prisoners of war and civilians: Misc. 10 (1918), cd. 9024. Work of the Central Prisoners of War Committee 1916-1919: *Revue Internationale de la Croix Rouge* (No. 26, Feb. 1921). Report of the Joint Committee to enquire into the organization and methods of the Central Prisoners of War Committee, cd. 8615.

Up to Jan. 1922, neither the British Government Committee on the treatment by the enemy of British prisoners of war, nor the Committee on the Breaches of the Laws of War, had published any general report; nor had the Reports of the representatives of the Netherlands Government been published. (R. B. D. A.)

**PROFITEERING.**—The word "Profiteering" was introduced in 1919 into an Act of Parliament, and thus may be said to have obtained official recognition as part of the English language. It had become current colloquially quite early in the World War. The following implicit definition was given by Sir Auckland Geddes (as president of the Board of Trade) in Parliament on the second reading of the Profiteering bill (1919):—"To profiteer is to make an unreasonably large profit, all the circumstances of the case being considered, by the sale to one's fellow-citizens of an article which is one or one of a kind in common use by the public, or is material, machinery, or accessories used in the production thereof."<sup>1</sup> A social and economic prob-

<sup>1</sup> Hansard, vol. 119, No. 114, Col. 545, Aug. 11 1919.

lem the conception of "profiteering" was a new one as well as the name attached to it, since the possibility of unreasonably high profits being reaped on a large scale to the public detriment from the sale of articles in common use was a direct outcome of the conditions of disorganized trade and world-shortage of commodities which resulted from the World War. It is clear that under normal economic conditions high profits do not necessarily involve high prices, but may even be obtained as a result of greater efficiency of organization or production. It is probably true to say that before the war, as a rule, a free market and plentiful supplies afforded, in the case of most commodities in general use, an effective safeguard against excessive profits based on excessive prices.

It was no doubt partly with this consideration in view that (to meet the demand for a clearer definition of the offence) a provision was inserted in the bill in Committee, laying down that a rate of profit not exceeding the pre-war rate should not be deemed "unreasonable." It is with profiteering in this technical sense that this article deals, and not with the wider economic problems affecting profits as such.

The Profiteering Act, 1919, was thus a temporary measure designed by the British Government to meet peculiar circumstances. It was a measure "to check profiteering," and accordingly was framed to avoid, so far as possible, any interference with legitimate commercial enterprise. The great difficulty presented by legislation of this kind is to design an instrument of such accuracy, and to use it with such precision, that it shall deal effectively with the evil against which it is directed, without hitting the sensitive organism of trade and industry, the recovery of which was in itself an essential factor in the removal of those conditions of shortage and high prices of which profiteering was to a large extent a symptom. How far the Profiteering Acts succeeded in solving this difficulty is a matter of opinion, but this was the problem they had to deal with.

The main powers conferred upon the Board of Trade by the Profiteering Act, 1919, may be summarized as follows:—(a) to investigate prices, costs and profits at all stages; (b) to receive and investigate complaints regarding the making of excessive profits on the sale of any article to which the Act was applied by the Board of Trade, and after giving the parties an opportunity of being heard either to dismiss the complaint or to declare the reasonable price for such articles, and to order the seller to refund to the buyer any amount paid in excess of such reasonable price. The Board also had power, where it appeared to them that the circumstances so required, to take proceedings against the seller in a Court of Summary Jurisdiction; (c) to obtain from all sources information as to the nature, extent and development of trusts, and similar combinations.<sup>1</sup>

The Act was applied by the Board of Trade by a series of orders to practically every article of ordinary everyday use, including all articles of wearing apparel, household utensils and requisites, articles for mending and knitting, furniture, building materials, drugs and medicinal preparations, medical and surgical appliances and dressings, mineral waters, all articles used for fuel and lighting, tools, weights, measures, weighing and measuring instruments, motor spirit, stationery, and, in agreement with the Ministry of Food, to practically all articles of food the price of which was not otherwise controlled, including milk, bread, fish, tea, coffee, cacao, margarine and meat. Further, in accordance with extended powers given by Section 2 (2) of the Profiteering (Amendment) Act, 1920, the following processes were by order brought within the operation of the Acts: the repairing, altering or washing of articles of wearing

apparel and household linen, etc., the repairing, altering or cleaning of clocks and watches, and the repairing or altering of boots, shoes and umbrellas.

For administrative purposes the Act empowered the Board of Trade to establish or authorize local authorities to establish local or other committees to which the Board might delegate any or all of their powers under the Act (except the power to fix maximum prices). The work fell naturally into two broad sections, viz.: (1) the larger transactions of wholesalers or manufacturers which raise wide questions affecting whole trades or industries, and (2) retail trade, which is much more affected by local conditions. To deal with (1) the Board of Trade set up a Central Committee, with its headquarters in London; to deal with (2) the Board invited local authorities throughout the country to appoint local profiteering committees.

**Local Committees and Appeal Tribunals.**—Over 1,800 local committees were established in the United Kingdom, and the vast majority continued in existence until the expiration of the Profiteering Acts in May 1921. Their constitution, powers and procedure were defined by regulations made by the Board of Trade, who delegated to the local committees the bulk of their powers under the Act in relation to retail sales. The regulations provided among other things that labour, women, and the retail trade should be adequately represented on local committees; that complaints should, except in special cases, be heard in public; that any member who happened to be a trade competitor of the respondent or otherwise personally interested should be disqualified from adjudicating; that a complaint should be lodged in writing within four days of the sale, and a copy forwarded to the respondent within seven days of its receipt; that a preliminary investigation should first take place, after which if a *prima facie* cause of complaint had been disclosed at least three days' notice should be given to the parties of the date fixed for hearing the complaint; and that both complainant and respondent should always be given an opportunity of being heard. The object of the preliminary investigation was to weed out frivolous complaints. The rule was laid down that it should invariably be held *in camera* and that the names of the parties to any complaint should not be made public until such time as the complaint was heard in public. The Board of Trade also appointed 108 appeal tribunals, to which the seller had a right of appeal against the decision of a local committee. The total number of complaints investigated by local committees during the operation of the Acts (Aug. 1919 to May 1921) was over 4,700; of these some 73% were dismissed. Only 173 appeals were made, of which roughly two out of every five were dismissed. Only 202 prosecutions by local committees were reported to the Board of Trade; in these fines were imposed to the amount of some £1,786, and costs ordered against the seller to the amount of £455. Within the limits laid down by the regulations local committees had full freedom of action and were in no sense controlled by the Department. The Department, however, both by correspondence and through a small staff of six or seven travelling inspectors, kept in close touch with the committees' work, and helped them wherever possible with advice and information. Apart from the work arising out of actual complaints, the local committees had the power to hold general investigations into prices, costs and profit at the retail stage, but comparatively few committees undertook such investigations. The report of the county of London appeal tribunal, which dealt with a much larger number of cases than any other appeal tribunal, has been published as a Parliamentary paper.

**Central Committee.**—This body, about 150 in number, was widely representative, including among its members manufacturers, traders, consumers, trade-union representatives, economists, representatives of the cooperative movement, etc. Mr. McCurdy, its first chairman, was succeeded after about 10 months by Mr. John Murray, M.P. The Board of Trade made regulations laying down the constitution, powers and procedure of the Central Committee, to which the Board delegated the power (a) to investigate prices, costs and profit at all stages; (b) to investigate, consider and determine complaints regarding unreasonable charges arising out of the wholesale sale of any articles to which the Act was applied; and (c) to obtain information regarding trusts and trade combinations.

The Central Committee rarely met as a committee. Its functions were rather those of a panel, and the work was performed by three standing committees: the Investigation of Prices Committee, the Complaints Committee, and the Standing Committee on Trusts. Every member of the Central Committee was appointed on one at least of these standing committees, which in turn appointed from time to time small sub-committees. These sub-committees, through which the bulk of the work was done, were composed of members of the Central Committee with the addition often of outside persons appointed (in practice at the suggestion of the sub-committee or standing committee concerned) by the Board of Trade.

The Investigation of Prices Committee undertook the investigations into the cost of production of various articles in all stages of their manufacture where they considered it desirable to obtain such information for the benefit of the public or of the Board of Trade. The reports on these investigations were published from time to time as Parliamentary papers: they cover the following subjects: agricultural implements and machinery, aspirin, biscuits, boot and shoe repairs, brushes and brooms, clogs, costings in Government department, furniture, gas apparatus, matches, metal bedsteads,

<sup>1</sup> Powers were also conferred on the Board of Trade by the Principal Act to fix maximum prices, and to authorize local authorities under suitable conditions to buy and sell any article or class of articles to which the Act was applied. These powers were only intended to be held in reserve for use in an emergency. Neither power was ever exercised, with the single exception of the temporary fixing of the price of motor spirit during the railway strike in the autumn of 1919. Further provisions were embodied in the Act (or added by the Amendment Act of 1920) giving the Board compulsory power of obtaining information, providing proper safeguards for confidential information and for secret processes, providing against victimization of complainants by sellers refusing to sell, excluding from the scope of the Acts sales for export or sales by public auction or competitive tender, and laying down maximum penalties by way of fine or imprisonment for persons offending against the Acts.

motor fuel, pottery, standard boot and shoe scheme, tweed cloth, wool and worsted yarns, wool, and the wool-top-making trade.

The Com plaints Committee undertook the investigation of specific complaints arising out of transactions or sales other than retail sales. In practice the Com plaints Committee became, like the Central Committee itself, a panel, working almost exclusively through sub-committees or tribunals. The procedure was analogous to that of local committees, the complaint being first considered *in camera* by a sub-committee called the Preliminary Investigation Committee, who, if they were of opinion that the complaint did not give sufficient particulars or did not disclose *prima facie* grounds for hearing the complaint, had power (after giving the complainant an opportunity of being heard) either to dismiss the complaint forthwith or to require the production of further or better particulars or grounds of complaint within a stated period, failing which the complaint was dismissed. If the Preliminary Investigation Committee were satisfied that a *prima facie* cause of complaint was disclosed, a tribunal was appointed<sup>1</sup> to hear the case, seven days' notice being given to the parties of the time and place fixed for the hearing. The tribunal had power either to dismiss the case, or (if they were satisfied that an unreasonable profit had been made) to order the seller to repay to the complainant any amount paid by him in excess of the price declared by the tribunal to be reasonable; further, the tribunal might take proceedings against the seller before a court of Summary Jurisdiction. The hearing of all complaints before the tribunal was normally in public, subject to the discretion of the tribunal in particular cases, and the parties could conduct their own cases or be represented by counsel or otherwise. As in the case of local committees, trade competitors or persons otherwise personally interested were disqualified from adjudicating on the tribunal.

The Com plaints Committee also investigated specific transactions brought to their notice, even where there was no formal complaint; e.g. cases referred to the Board of Trade by local committees where a complaint against a retailer had been dismissed, but it appeared probable that profiteering had taken place at some earlier stage of distribution or manufacture. The following figures show the number of matters referred to the Com plaints Committee and the manner in which they were dealt with:—Com plaints lodged or specific transactions referred to the committee, 607; profiteering found to exist, 73; number of prosecutions undertaken, 24; number of convictions obtained before the magistrates, 17; fines imposed, £815; costs ordered, £205.

The Committee on Trusts was charged with the duty of obtaining such information as is specified in Section 3 of the Profiteering Act, 1919, which required the Board of Trade to "obtain from all available sources information as to the nature, extent, and development of trusts, companies, firms, combinations, agreements and arrangements connected with mining, manufactures, trade, commerce, finance, or transport, having for their purpose or effect the regulation of the prices or output of commodities or services produced or rendered in the United Kingdom or imported into the United Kingdom, or the delimitation of markets in respect thereof, or the regulation of transport rates and services, in so far as they tend to the creation of monopolies or to the restraint of trade."

This section embodied a recommendation of the departmental committee appointed by the Minister of Reconstruction "in view of the probable extension of trade organizations and combinations, to consider and report what action, if any, may be necessary to safeguard the public interest," which reported in 1919. It is to be noted that the Act gave no power under which any coercion could be exercised on a trade combination except in so far as it brought itself within the penal clauses of the Act by charging unreasonably high prices. Parliament appears to have taken the view that powers of this kind ought to be the subject of further permanent legislation, and that the temporary powers of enquiry and publication given by the Profiteering Act should make it possible by preliminary investigation to get together a body of facts which would be of great value when permanent legislation on the question of trade monopolies was introduced. The numerous reports by sub-committees of the Committee on Trusts constitute in fact such a body of information. They show, on the one hand, that many of the big combinations now existing have been of public benefit; that by economies in working and efficient organization of manufacture, buying, and selling, they have been able to keep prices at a lower level than they must otherwise have attained. On the other hand, instances of abuse of monopoly power have been brought to light, and, in general, many of the reports are in favour of the provision of some kind of statutory power, under which action could be taken if a strong and close organization controlling the whole or nearly the whole of an essential trade or industry adopted a policy contrary to the public interest.

The following is a list of the investigations on which reports by the Committee on Trusts have been published as Parliamentary papers:—dyes and dyestuffs, dyeing, finishing, bleaching and printing, electric cables, electric lamps, explosives, farriery, fish, fixed retail prices, fruit, glassware, iron and steel products, laundry prices, meat, milk, oil and fats, pipes and castings, road transport rates, salt, sewing cotton, soap, tobacco, uniform clothing, vinegar and yeast.

<sup>1</sup> Originally by the Com plaints Committee, but under the amended regulations of Aug. 7 1920 by the Chairman of Central Committee.

Reports on the following subjects by sub-committees jointly appointed by the standing committees on Prices and Trusts have also been published:—bricks, cement and mortar, dyeing and cleaning, light castings, stone and clayware, slates and roofing materials, and timber.

The Profiteering Act was to remain in force for six months only. It was, however, continued for a further three months by the Profiteering (Continuance) Act, 1919, and again for a further twelve months (until May 19 1921) by the Profiteering (Amendment) Act, 1920. The Amendment Act was largely concerned with improvements of machinery in points of detail where experience of actual working had disclosed defects. It contained, however, in Section 1 an important new provision, the object of which was to encourage the various trades and industries to take into their own hands the business of checking profiteering.

Section 1 reads as follows:—

(1). Where any persons or associations of persons appearing to the Board of Trade to represent a substantial proportion of the persons engaged in the production or distribution of any article or class of articles to which the Profiteering Act, 1919 (hereinafter referred to as 'the principal Act'), is applied, submit to the Board of Trade a scheme limiting the profit to be allowed on the manufacture or distribution of the article or class of articles at all or any stages of manufacture or distribution, the Board of Trade may, if they think it expedient, approve the scheme, and, where any such scheme is so approved, any profit sought or obtained in connexion with the sale of any article to which the scheme relates, which does not exceed such profit as is allowed by or under the scheme, shall not be deemed unreasonable for the purposes of section one of the principal Act.

(2). If the Board of Trade are satisfied that any scheme so approved secures an adequate supply to the home market of any articles or classes of articles to which the principal Act is applied, the Board of Trade may by order exempt producers who comply with the scheme from any general investigation under section one, subsection (1) (a) of the principal Act in respect of those articles or classes of articles and any articles of a similar description.

The preliminary work of investigation and negotiation in connexion with schemes submitted under this section was undertaken by the Central Committee, the final approval or disapproval resting, of course, with the Board of Trade. Owing to the unexpectedly rapid fall of markets and alteration in the general trade outlook in the latter part of the year 1920, conditions were not very favourable for profit-limiting schemes. Very few were put forward; of these some were withdrawn or not proceeded with, and only two\* (relating to men's ready-made and made-to-measure clothing and to the retail sale of coal in the London area) were actually approved by the Board of Trade.

The foregoing is a brief review of the principles on which the Profiteering Acts were based, the machinery by which they were worked, and the nature of the work. The Acts were denounced as harassing the small retail trader while enabling the profiteer on a large scale to escape; but complaints against the harassing nature of the Acts came from all quarters, wholesaler, retailer, and manufacturer alike. Although it is possible that investigations may in rare cases have caused hardship to particular interests, this can hardly be held to outweigh the valuable results in helping to dispel misconceptions and suspicions by publishing facts. The figures already quoted with regard to complaints would indeed seem a sufficient answer to the charge that trade was unduly harassed. On the other hand the deterrent effect of the Acts must not be overlooked. From the point of view of checking profiteering, the mere existence of the penal clauses of the Acts and of the machinery for their enforcement was undoubtedly of great value. As regards the absence of any definite standard of a reasonable rate of profit, the original Profiteering bill was criticized in Parliament on the ground that it gave no clear definition of the offence. This criticism was met to some extent by the proviso that a rate of profit not exceeding the pre-war rate should not be deemed unreasonable; and in the Amendment Act the position was further defined by making it clear that the standard of comparison to be aimed at was the percentage rate of net profit, not gross profit, thus

\* Reports on these by joint sub-committees of the Standing Committees on Prices and Trusts, and also on the working of the standard boot and shoe scheme (which was not technically a scheme under Section 1), have been published as Parliamentary papers.

ensuring that the seller should not benefit unduly by the fact that his oncost or establishment charges showed a smaller increase than did cost of wages and raw materials.

A word may be added with regard to anti-profiteering legislation outside the United Kingdom. The majority of European countries, including Belgium, France, Germany, Italy, Norway, Poland, Portugal, Rumania and Sweden, passed some form of legislation with a view to checking profiteering or speculation in the necessities of life. Legislation with this object was also passed in Australia, Canada, New Zealand, the Union of South Africa, and a number of the smaller British possessions. A number of foreign countries or British possessions studied through their representatives the working of the Profiteering Acts, 1919 and 1920, and several (as for example Italy, South Africa, Gibraltar and Sierra Leone) availed themselves largely of English experience in framing their anti-profiteering legislation.

(E. R. E.)

#### UNITED STATES

"Profiteering," as the term has been used in the United States, may be roughly defined as consciously taking and retaining profits considerably in excess of the return necessary to equilibrate demand and supply, especially when such profits are the result of prices enhanced by the activity or policy of the recipient. Its meaning has therefore a direct relation to the current conception of a legitimate business "profit"—a point on which public opinion during the World War became peculiarly sensitive. Probably, conscious direct control of industrial processes never reached such development in the United States as during the World War. Prices were fixed and both supply and demand controlled. Income taxes were highly developed. An unusual mass of information concerning cost, production, consumption and stocks was obtained. As a result much became known of the profits made in different industries, and much information concerning them was given out—sometimes with the purpose of exercising a check. In the United States the chief sources of information are the cost reports of the Federal Trade Commission and data compiled from the income-tax returns. If it be remembered that not all that seems excessive is profiteering, it will be of value to recapitulate some of these data.

According to income-tax returns from some 7,000 corporations their net earnings of the pre-war years 1911-3 averaged 11% on invested capital. This corresponds well with the common judgment at that time that from 10% to 12% (depending on the risk) was a fair profit in most industries. Unfortunately, returns are not available in published material for these same corporations in 1917, but for 1918—a year of lower profits—they averaged 15%. The year 1917 was the time of maximum profits. We know that in that year the total net income of 31,500 corporations was well in excess of the total for all corporations in the country in 1913. These corporations made an average net return on investment of approximately 22%, and more than one-half of their net income was reported by those earning 30% or more. (It is to be noted that these figures do not include corporations earning under 15%. Nevertheless, it is probable that all corporations averaged approximately 18%.)

These income-tax returns are not conclusive. The padding of investment account and of costs was all too common, and the statistical treatment of the returns is not satisfactory. They do indicate, however, that average profits increased considerably between the pre-war period and 1918. More accurate and illuminating figures concerning particular industries were obtained by the Federal Trade Commission, and a few representative cases will give the best understanding of the situation. A study of the costs of 37 wheat-flour companies showed that the average earned on investment was 12.6% in the fiscal year 1913-4, 17% in 1914-5, 38.4% in 1916-7, and 34% in 1917-8. That this increase in profits was not due solely to increase in business is evident from the fact that the percentage earned on sales also increased, the rate being 3.4% in 1913-4 and 6.5% in 1916-7. In 1917 there was apparently no limit to the price purchasers were willing to pay, the condition being one of panic. The large

profits of the year were partly due to the enhanced value of unsold stocks and to speculative profits derived from feed. In the next year profits were somewhat abated by Government regulation. The Federal Trade Commission, after noting that the margin of 25 cents per bar. allowed by the Food Administration was larger than the normal profit, said: "The Commission's investigations of costs and profits for recent months indicate that 25 cents a barrel is being taken by many millers as a guaranteed net profit after paying all income and excess profit taxes. . . ." In other words (1) taxes payable on net income were being wrongfully treated as expense, and (2) a maximum margin was being made the minimum. This course involved some fraud and showed concerted action. Depreciation and salary accounts were padded and capital charges were treated as operating expenses.

Twenty-two manufacturers of farm implements made at this time about 85% of the product in the United States. Their profits increased from about 9% on investment in the years just prior to the war to 16.6% in 1917 and 19.9% in 1918; and the rate of profit on sales increased several fold. There was no general shortage of farm implements and no unusual demand, for exports were cut off. The Commission says: "The large increase in the prices and profits of manufacturers in 1917 and 1918 was due in part to price understanding or agreements . . . and, to a more limited extent, the profits of dealers seem to have been due to similar activities."

From Senate Document No. 248 (65 Cong. 2nd Session) further evidence of profiteering may be gained. It appears that oil companies circulated reports that the supply of gasoline was dangerously short, for the purpose of maintaining prices of that commodity while making "enormous" profits on fuel oil. Concerns bottling or canning vegetables, which had made future contracts, sometimes withheld portions of their output from delivery on such contracts and sold in the higher "spot" markets. In frequent cases licences were revoked by the Food Administration. The practice of such concerns in maintaining re-sale prices for jobbers contributed toward maintaining the general high level of prices and increased profits in some instances. According to the same document the steel companies in 1917, prior to Government price-fixing, made abnormal profits, and a number continued to make unusually heavy profits thereafter. The United States Steel Corp., which made 5% before the war, received 25% on investment in 1917; and 10 smaller concerns, such as begin their operations with the employment of steel furnaces, made from 30% to 319% on their investments. Certain sulphur companies took advantage of the war demand for sulphur to raise their prices to such an extent as to reap net profits of approximately \$15 a ton, which meant over 200% on investment in one case. It further appears that "unnecessarily" large profits were made by the producers of yellow pine lumber in the South. A good margin per 1,000 bd. ft. had been considered to be \$3, but in 1917 the average margin was over \$4.80; and while the average profit on investment in 1916 was 5.2%, the figure was increased to 17% in 1917. The profits of tanners increased from two to five times, as they took advantage of the enormous demand for leather and exacted very high prices. The price of hides was rapidly advanced, notwithstanding that at the same time "great supplies were withheld from the public." Upon learning of approaching price control, one of the large packers took steps "quietly and promptly" to increase the appraised value of his tanneries.

Other figures indicating the general trend may be given as follows:—

	Percentage of net earnings to investment		
	1914	1916	1917
Meat packers (large) . . .	8.3	18.5	26.5
Tanners . . .	12.9	33.8	25.7
Shoe manufacturers . . .	15.1	26.1	24.7
Bituminous coal (Pa.) . . .	—	6.0*	32.6*
Vegetable canners . . .	—	9.0	32.0
Salmon canners . . .	—	22.0	52.7
Petroleum refiners . . .	15.0	—	21.0
Copper producers . . .	11.7	—	24.4

\*Percentage of net sales.

According to the annual report of the Attorney-General for 1920, since Oct. 1919 sentences had been imposed on 49 sugar dealers and 20 clothing dealers. This was under the anti-profiteering law, referred to below. In addition, six sugar dealers and one flour dealer had been convicted of hoarding, and two coal dealers had been sentenced under the provision as to fixing reasonable prices. In all there had been over 2,000 indictments, arrests and sentences, involving chiefly the commodities just mentioned, together with meats, potatoes, and meals at restaurants. The great majority could not be sustained under the law.

Without further evidence it may be concluded that profits in many industries increased in the earlier part of the war more than 100% above the pre-war level, and that this increase was in not a few cases due in part to profiteering as above defined. High prices do not necessarily indicate excessive profits, but there is reason to believe that profiteering was common in cement, petroleum, lumber (notably ship timber), wool, clothing, sulphur, naval stores, rice, sugar, sand and gravel, raisins and other products, in addition to those already mentioned. In most of these cases the Government reduced prices and profits through some form of control. Anyone who had experience at Washington during the war knows that many persons went there for the purpose of furthering profiteering schemes. In some cases the method was to secure contracts at excessive prices, perhaps by bribery, certainly by misrepresentation. Many such cases later came to light, some concerning articles of clothing for the army and involving collusion with army officers. In other cases the method was to induce the Government to abstain from fixing a reasonable price or to induce it to fix a high price. Thus, in the United States, oil companies succeeded in virtually preventing any price-fixing on the ground that the exorbitant prices that prevailed were necessary to stimulate production; while lumber, copper and cement associations by concerted and persistent activity obtained prices that were unnecessarily high. In still other cases every effort had been made to defraud the Government in respect of excess profits taxes, to enable a business to "retain" profits larger than lawful. Equally reprehensible was the action of hosts of retail dealers, such as those selling shoes and men's clothing, who maintained the same percentages of profits on sales although the great increase in prices meant greatly increased absolute margins and percentages on investments.

The U.S. Government attempted to deal with profiteering in three ways: (1) taxation; (2) price-fixing; (3) direct action under the Food Control Act. The first and the last methods proved largely ineffective.

By special taxes levied on profits, many thought that the spoils of the profiteers could be regained by the public. In 1916 a tax of 12½% was levied on the profits of munitions manufacturers; and a general "war profits tax" and an "excess profits tax" were imposed in 1917. In 1918 these taxes were combined. Under this measure profits of corporations organized for profits were liable either to (1) a progressive tax on profits in excess of 8% on capital; or to (2) a flat tax of 80% of net income over the average profits for the three pre-war years 1911, 1912 and 1913. Not a few legislators and economists hoped that these taxes would make regulation of prices or profits unnecessary. Let any concern make what it can, they said, we will take it as fast as they make it. But, unfortunately, it proved so easy for most corporations to increase their investment accounts, and to pad their expenses, that the worst profiteers often showed small excess profits. Moreover, a considerable part of the tax was shifted to consumers in the shape of higher prices, as was possible during the inflation period.

Government price-fixing, while it did not prevent profiteering, did moderate the evil, notably through such substantial reductions as were made in the prices of wool, coal, sugar, flour and sulphuric acid. Unfortunately, this means was not used as vigorously and thoroughly as it would have been had there not been an ill-founded reliance upon profits taxes.

On Aug. 10 1917 the Food Control Act became law. Section 4 of this Act made it unlawful for any person to hoard or to make any unjust or unreasonable charge in transactions relating to

"necessaries" (foods, feeds, fuel, fertilizers, farm implements and machinery), but imposed no penalty. Sections 6 and 7, however, provided for penalties and seizure, in case of hoarding. Section 5 authorized the licensing of dealers in necessities and the fixing of fair storage charges, commissions, profits, or practices. The fixing of prices for coal and coke was authorized in section 25. It was under this Act that the Food Administration operated, and, as already indicated, its control over prices was partly effective. On June 30 1919, however, the activities of the Food Administration were suspended; and as the agitation concerning the "high cost of living" grew in volume, the Department of Justice assumed the task of enforcing the law, which remained in force while a state of war was only technically in existence. Between Aug. and Nov. 1919, the Department made some 92 seizures of such food products as eggs, butter, sugar, flour and pork, under section 7, and secured several indictments under section 6, one indicted party pleading guilty. The chief agencies depended upon were the local "fair price committees" such as had been established under the Food Administration. Indeed, the wartime organization of local food administrators was partly revived, and an extensive publicity campaign was initiated. But the Attorney-General found his efforts limited by the absence of a penalty clause in section 4 and the restricted definition of "necessaries," and, at the President's request, Congress reenacted the law in Oct. 1919, with amendments to cover these defects. Encouraged by this action, and animated, it is charged by his critics, largely by political ambition, the Attorney-General proceeded vigorously under the Act, and in his annual report for 1920 stated that there had been 1,049 prosecutions under section 4 and 99 convictions.

Meanwhile, a growing hostility to the Act was apparent, and the courts in several jurisdictions declared it unconstitutional. This was true in five of the ten chief bituminous coal-producing states. Action concerning anthracite coal profiteering was also blocked by a decision of the Federal District Court in Pennsylvania. The upshot of the matter was a decision of the Supreme Court in Feb. 1921, which finally declared the Act unconstitutional. The case was that of *U.S. v. L. Cohen Grocery Co.*, and involved profiteering in sugar. The reasoning of the Court was that Congress alone had power to define crimes against the United States; and, therefore, because the Act was vague and indefinite, and fixed no precise standard of guilt, and because it did not inform the defendant of the nature and cause of the accusation against him, it was unconstitutional. Thus ended the anti-profiteering crusade of the Attorney-General. Meanwhile, from April 1920 prices began to decline, and with that decline came a loss of interest in profiteering.

In a sense the U.S. Government was to blame for much wartime profiteering. In the first place it was lax in letting contracts and making purchases, either directly, or indirectly, by placing authority in the hands of interested persons. The "cost-plus system" invited profiteering as well as inefficiency. In the second place its combination of excess profits taxes and price regulation was unfortunate. At the same time that it fixed prices on a cost basis it spread the idea that it made little difference if excess profits were earned, as such profits would be reached by taxation. Taxation, however, proved at best to be an inadequate means of reaching profits, and early laxity in defining cost and investment made this means nugatory. The system as it worked in the United States tended toward laxity both in fixing prices and in collecting taxes on income. (L. H. H.)

**PROFIT-SHARING AND CO-PARTNERSHIP** (see 22.423).—Profit-sharing was defined by the International Conference on Profit-Sharing held in Paris in 1889 in the following formula: "The International Congress is of opinion that the agreement, freely entered into, by which the employee receives a share, *fixed in advance*, of the profits, is in harmony with equity and with the essential principles underlying all legislation." This definition, which is accepted by nearly all writers on profit-sharing, excludes on the one hand distributions made by a firm to its employees, say at Christmas, the amount of which is not fixed in advance, and to which the employees have no definite right.

Such distributions are to industry what the Squire's coal and blankets are to village life, but they are not profit-sharing. It also excludes forms of "output bonus," etc., under which the individual employee (or the squad or gang) gets, or is supposed to get, a share of the money which he individually saves to the firm by working faster or better; this was formerly classed with it under the general term *gain-sharing*, and *profit-sharing* is still sometimes incorrectly used to cover such forms of bonus. Under true profit-sharing the share of the employees varies with the prosperity of the firm, and depends therefore not on their exertions solely but on the competence of managers and directors, the state of the market, and other considerations.

The Labour Co-Partnership Association in 1911 expressed its view that the co-partnership of labour with capital involved: (1) "That the worker should receive, in addition to the standard wages of the trade, some share in the final profits of the business, or the economy of production." (2) That the worker should accumulate his share of the profits, or part thereof in the capital of the business employing him, thus gaining the ordinary rights and responsibilities of a shareholder." To this in 1919 the Association added a further clause: (3) "That the worker shall acquire some share in the control of the business in the two following ways:—(a) By acquiring share capital, and thus gaining the ordinary rights and responsibilities of a shareholder. (b) By the formation of a co-partnership committee of workers having a voice in the internal management." The addition of the last clause is due to the belief, now rapidly gaining credence, that the smaller shareholders in the ordinary firm have in reality little or no voice in its management, and that other means are necessary to provide the employee co-partners with their share in control. It has not, however, been adopted by all, or nearly all, of the firms which have co-partnership schemes.

Profit-sharing and co-partnership are thus seen to differ in theory by the fact that the profit-sharer has a share only in the cash profits of his employer over a given period, and may take his share away in his pocket entire, whereas the co-partner must take some of his profit in the form of investment in the business, and receives also some share in the management. In some cases the co-partner does not actually have to invest, but is offered shares at par or at reduced rates, or even free, these shares generally carrying with them all shareholders' rights. In practice, however, there are so many possible variations that no general distinction is possible, and the terms are frequently interchanged. It will also be observed that both forms assume the existence in industry of two parties, the "firm" and its "employees." They are therefore not connected with the various coöperative experiments which have been made from time to time by groups of workers, forming themselves into a firm and dividing amongst themselves the profits or losses, with the coöperative colonies of Robert Owen in England, or the *ateliers* or self-governing workshops of Louis Blanc in France. Co-partnership, as now understood, is distinctly a "paternal" movement, the dominant "partner" in industry being moved to confer a favour on its junior; and though the ideals of Owen, Fourier and the Christian Socialists may have had some influence on the minds of the earliest co-partners, a truer descendant than the co-partnership of to-day is the working-class Coöperative Movement, which aims at the supersession of capitalism.

The earliest example of co-partnership comes from France. In 1843 a master painter of Paris, Edmé-Jean Leclaire, divided among his permanent hands (43 out of about 300 employed) the sum of 12,266 francs. The scheme met with approval and up till 1870 this "kernel," as he called it, of permanent workmen, who were members of the firm's mutual provident society, continued to take their share of the increasing profits. At no time did the members of the mutual provident society amount to more than a third of those employed. In 1870 the profit-sharing was extended to all the men employed, for however short a time, and upon this basis it has continued as "Brugnot, Cros et Cie. (ancienne maison Leclaire)." The arrangement for division of profits is as follows:—5% is first paid on the capital; of the remainder 15% goes to the managing partners

(who according to French law have unlimited liability), 50% as a dividend to all workers in proportion to their time wages, and 35% to the mutual provident society—the "kernel"—which is now a partner in the business. The managing partners also receive a salary. This experiment, as it was the first, is also peculiar in the amount of control entrusted to the permanent workmen, the "kernel," who are very carefully chosen. Among their other privileges it falls to them to elect new managing directors among the employees, a privilege not, as far as the writer is aware, granted under any English scheme of co-partnership. The whole business, however, employs only between one and two thousand workers; its interest is, therefore, chiefly as an experiment. (For fuller accounts of this and other French schemes, including the *Familistère* of Guise, consult the publications mentioned at the end of this article.)

France, as it was the original home of co-partnership, has also been the country in which it has excited the most interest, and the comparative lack of trustification in French industry has made it easier for schemes established by individual firms to be accepted. The numerical weakness of French trade unionism has also made it easier to gain the adherence of French workers, for an established trade-union movement is generally hostile to co-partnership and profit-sharing.

*United Kingdom.*—In the British Isles, if we except a scheme inaugurated in 1829 by Lord Wallscourt for the farmers on his Galway estates and abandoned shortly afterwards, the movement begins in 1865 with the adoption of six schemes, of which five have since been abandoned, although one (adopted by Messrs. Jolly & Son, silk mercers, of Bath) survived until 1906. One of the five was the famous Briggs scheme, of the Whitwood and Methley Collieries, to which reference is made below. The movement then progressed very slowly for some years. Between 1865 and 1888 only 66 schemes in all were launched, of which all but fourteen had disappeared by 1920.

The International Congress on Profit-Sharing which drew up the definition quoted at the head of this article was held in 1889. In that year also the South Metropolitan Gas Co. adopted profit-sharing, and thus initiated it in the only British industry in which it has obtained any considerable hold. These two facts combined to stimulate an interest in profit-sharing, and during the four years 1889-92, 83 schemes were adopted, of which only 12 survive. A long decline in profit-sharing, owing partly no doubt to the trade depression which began in 1892, led up to rather less vigorous revivals during 1908-10 and 1912-4. The World War then practically put an end to the development of the system, until the phenomenal profits of the early months of the peace and the willingness of many firms to share some of them with their employees, led to an outburst of 42 schemes in 1919. The boom continued during the early months of 1920 (19 during the first six months); but during the subsequent industrial depression there was a marked slackening of interest in this direction.

Up to the end of 1919 the British Isles had given birth to 417 schemes, of which 198, or slightly less than half, have been abandoned for one cause or another. Of the remainder, 36 were run by gas companies (see below). These figures alone, however, would give a misleading impression of the size of the movement. Of the 144 schemes started up to 1918, only 15 are returned as affecting more than a thousand employees, while no fewer than 54 affect less than a hundred. Out of the 15 again, four are run by gas companies (the South Metropolitan, the South Suburban, the Gas Light and Coke Co., and the Liverpool Gas Co.), and of the remaining 11, four of the largest affect only a portion of the workpeople in the firm's employ. These are:—Messrs. Armstrong Whitworth & Co., (12,215 out of 69,000 employed); Messrs. Pease and Partners, of Darlington (2,243 out of 11,000); Messrs. Lever Bros. (3,542 out of 8,833); and the Bradford Dyers' Assn. (3,600 out of 9,800). The only really large concern whose profit-sharing affects nearly the whole of its workpeople is the Prudential Assurance Co., 18,500 of whose 20,000 employees participate in its scheme. Details of the number participating are not available for schemes

started since 1918, but as out of the 42 firms only eight have a pay-roll of over 1,000, while ten employ less than 100, it would seem that the proportions would not be materially altered if they were all included. Neither do all the smaller firms include by any means all their employees in their profit-sharing schemes. The proportion varies from case to case, falling as low, in the case of one firm of manufacturers, whose scheme dates from 1899, as 50 out of 1,500, or 3 1/3 per cent. It is clear that in this and similar cases the co-partnership is really a tiny experiment carried on with a few picked employees and is of infinitesimal significance in the industrial life of the country. Nor is it only the successful experiments that are of this type; the abandoned schemes tell the same tale, except that the number of participants is lower.

Apart from the gas companies, then, co-partnership in British industry has been confined, with one or two exceptions, to small firms, and these for the most part in minor industries. The food trades, such as cocoa, confectionery, jam, chocolate, etc., and the distributive houses provide a large number of experiments; tailoring, dress-making, boot and shoe manufacture, and printing and stationery are also considerable groups. In the great basic industries of the country, (mining, cotton, engineering and shipbuilding) and in transport, co-partnership has made practically no progress, nor does it seem to be making any.

What is the reason of this? An analysis of the reasons given for the abandonment of dead schemes may provide part of the answer. Forty-nine schemes were abandoned "for financial reasons," i.e. because there had ceased to be any profit to be shared. In 16 cases no cause can be assigned; and in about 40 the abandonment was due to changes connected with administration. There remain 91 schemes which were abandoned owing to the dissatisfaction of owners or men with their results. The men's dissatisfaction can generally be traced to a simple cause—the smallness of the dividend distributed. The average rate of bonus paid to workmen under all schemes varies within narrow limits and is generally about 5% per annum on the total of their wages. Translated into cash, this meant in 1918 that 105 firms paid to their workmen an average of £3 13s. 3d. per head, or, if the firms which paid nothing at all be excluded, of £5 18s. 2d. In 1919, the average bonus paid per head was £4 18s. 10d. It would readily be understood that so exiguous a cash benefit causes considerable disappointment to the worker who has been led to expect material advantages from being provided with an interest in the business; and this fact may also go some way towards explaining the failure of schemes which employers gave up owing to the "apathy" of their workmen. £3 13s. 3d. per annum, especially when paid in a lump at the end of twelve months, during which the workers have been working at ordinary rates, is hardly likely to provide a very strong incentive to better work.

This may account for the high mortality among profit-sharing schemes which have actually come into existence. More reasons, however, are needed to explain the smallness of their numbers and their comparative insignificance. This is undoubtedly due in part to the hostility of the consuming public, which tends to regard profit-sharing schemes as designed to keep within the industry money which should be used to reduce the price to itself. Thus the distributive Coöperative Movement, which is an association of consumers, has done very little in the way of profit-sharing or co-partnership, and that little is steadily growing less, and the English and Scottish Coöperative Wholesale Societies have both abandoned their schemes of profit-sharing, the former in 1886, and the latter in 1915.

The gas companies, to which reference has already been made, are not open to this criticism owing to their peculiar statutory position. All gas companies are regulated by Act of Parliament, and in most cases they are not allowed to increase their dividends unless the price of gas is correspondingly reduced. (In the other cases the dividend is limited to a fixed maximum percentage.) Thus the gas companies have never been able to make enormous profits at the expense of their customers, and moreover, since their accounts of capital and dividend must be regularly rendered to the Government, there is little or no cause for the

suspensions which occasionally develop in co-partnership concerns, of "watered" capital and the like. Further, there was frequently before the war a considerable surplus which the companies did not wish to use in reduction of price, which, therefore, not being available for shareholders' dividend, could be distributed among the employees. This, by keeping up the workers' dividend, served to render the profit-sharing scheme popular. Since the war, surpluses have largely disappeared.

But the greatest bar to the success of the co-partnership movement has undoubtedly been the hostility of the organized labour movement. The trade unions are almost uniformly opposed to it as a policy, and in some cases even expel any member joining a co-partnership or profit-sharing scheme. This was the case in 1920 with the Amalgamated Society of Woodworkers, whose right to expel members joining Lord Leverhulme's scheme at Port Sunlight was contested in the courts, though the decision finally went against them. The earliest firms to adopt profit-sharing did little to allay the suspicions of the unions. They were generally as unfavourable to the unions as the unions were to them. The well-known experiment of Messrs. Henry Briggs & Co., which was launched in 1865, was avowedly intended to draw the men away from their union, and came to an end ten years later, after a somewhat stormy career, because the employees chose rather to uphold their union in resisting an attempt by the employers to reduce wages than to remain in the firm's employ and get what they could. The scheme of the South Metropolitan Gas Co., which nearly came to grief in its first year owing to the company's insistence that every workman should sign a yearly contract, dating from different days in each case (which would have rendered any concerted strike punishable at law), also required, until 1902, every workman to sign a declaration that he was not a member of the Gasworkers' union. Recently this attitude has been modified, and the most distinguished advocates of co-partnership, such as Mr. Aneurin Williams, now insist on the recognition of trade unions: but the unions nevertheless hold that it gives the workers in a single firm a sectional interest and so tends to divide them from their fellows in the same trade, and, further, that there is always a danger that workers in a profit-sharing firm may, in return for the profit-sharing, be induced to accept less than the rates of wages which it is the unions' business to maintain. As far as one can see, this attitude is not likely to be easily changed in the near future, and the co-partnership movement, therefore, is unlikely to spread beyond the small firms and the minor industries in which trade unionism is weak.

**BIBLIOGRAPHY.**—The Ministry of Labour's *Report on Profit-Sharing and Labour Co-Partnership in the United Kingdom* (Cmd. 544. 1920.) is indispensable. It contains nearly all the available information, and has an exhaustive bibliography. The best book giving the case for co-partnership is Charles Carpenter's *Industrial Co-partnership*. A useful book is *Co-partnership and Profit-Sharings*, by Aneurin Williams (Williams and Norgate, 1913); a good analysis is to be found in *Methods of Industrial Remuneration*, by D. F. Schloss (Williams and Norgate, 1907). Later Edition. The Labour Co-partnership Association, 6, Bloomsbury Square, London, W.C.1., published a number of brochures dealing with particular aspects and particular experiments.

For the Labour point of view the best works are two pamphlets by Edward R. Pease: *Profit-Sharing and Co-Partnership; A Fraud and a Failure?* (Fabian Soc., 1913) and *Co-Partnership and Profit-Sharing* (Labour Party, 1921). See also chapters in *The World of Labour*, by G. D. H. Cole. (M. I. C.)

**United States.**—Profit-sharing, strictly defined, is a plan for increasing the ordinary remuneration of labour by amounts varying with the profits of the business. Popularly, the term is loosely used to describe a great variety of methods of wage payment. In this article it is used to describe an arrangement by which employees, other than managerial employees, receive, in addition to wages or salaries, a share of the net profits of the business, such share being distributed at the time of the declaration of dividends to stockholders. The arrangement may be expressed either by a formal agreement or an oral promise. Although the profits are contingent, the percentage of profits to be distributed is fixed and known in advance, and, like dividends,

is paid sometimes in whole or in part in stock instead of cash. This definition excludes many forms of wage payment commonly associated and confused with profit-sharing, such as the bonuses sometimes measured by individual or collective output, length of service, attendance at work or employee savings, and sometimes given as Christmas gratuities, and such as sundry stock-purchasing schemes, none of which fluctuate directly with the net profits.

The term "co-partnership" is not generally used in the United States in this connexion, since the implied constituents, profit-sharing, stock-ownership and participation in management, are not often found in the same establishment. Many profit-sharing plans arrange for distribution of stock as a part of, or as an addition to, profit-sharing. There are also more than 60 known stock-purchasing schemes, besides many arrangements for "managerial" or "limited" profit-sharing, affecting less than one-third of the total employees. Probably fewer than ten of these varied plans provide for workers' committees as an integral part of the arrangement.

Related to the idea of co-partnership, but quite apart from profit-sharing, are a considerable number of schemes for labour's participation in management which have sprung up during and since the World War. These schemes vary all the way from representation on boards of directors, in a very few cases, to joint management through industrial and works councils, shop committees, grievance and welfare committees, shop chairmen and voluntary arbitration boards. The distinguishing characteristic of these management-sharing plans is that under them the management does not depend upon organized labour, but deals with its own employees collectively. They are distinct from profit-sharing, in that the employer retains all of the profits he makes, though the workers are given collectively a voice in determining the wages, hours and working conditions which to some extent affect the profits account. Without doubt labour's participation in management in such a sense is more usual than profit-sharing and co-partnership.

The pioneers of true profit-sharing in the United States, dating from 1886, are the Ballard and Ballard Co. of Louisville, Ky., engaged in flour-milling, and the N. O. Nelson Manufacturing Co. of St. Louis, Mo., manufacturers of plumbers' and steam-fitters' supplies. The years of greatest installation of new projects were 1901, 1906, 1909-11, 1914-6, and 1919. Fully 70% of all the known plans were started after 1910. These variations in the progress of profit-sharing in the United States correspond with those in England, where profit-sharing plans found favour during periods of ample employment and labour unrest. It is only natural, however, that periods of low profits should check the spread of profit-sharing and cause the abandonment of many plans, the average life of abandoned plans being two to three years. For this reason, and since no comprehensive study had been made in the five years preceding 1921, it is difficult to state with confidence the exact number of profit-sharing arrangements existing in that year, one of general business depression. On the basis of the Government report in 1916 and subsequent semi-official studies it is estimated that 86 true profit-sharing plans were in operation at the end of 1920. Of these plans more than one-half (53%) were in manufacturing establishments, 16% in mercantile concerns, 11% in banking institutions, 9% in public utilities and the remainder scattered. Approximately two-thirds of these concerns employed less than 300 people, and only one-seventh employed more than 1,000, so that the total number of employees was less than 50,000. The number of arrangements solely for stock purchasing is not accurately known but the inclusion of several large corporations, as the United States Steel Corp. and the International Harvester Co., raises the number of participating employees to a million or more.

In the determination of the divisible fund of profits, two general methods, subject to individual variations, are followed: (1) Setting aside a specific percentage of profits after all ordinary expenses of the business, such as depreciation reserves and interest on invested capital, are taken care of; (2) fixing a rate of dividend on employees' earnings coördinate with the rate of

dividend on capital. Assume a corporation capitalized at \$1,000,000 with an annual payroll of \$100,000 and net profits of \$220,000 a year. In most plans using the first method, the preferred and common stockholders first receive dividends (not to exceed a certain per cent, say 10%, or \$100,000). The remainder of the profits fund (\$120,000) is divisible and is shared with labour according to a fixed percentage, perhaps 50% to labour and 50% to capital, or 40% to labour and 60% to capital. Four of the more recent plans allow employee beneficiaries to send an accountant on their behalf to verify the company's computations. Under the second method, the divisible fund depends on dividends declared. Thus if a 10% dividend is declared, a fund equal to 5% or 7½% of the total payroll (\$5,000 or \$7,500) is distributed among workers. The advantage to the management of this method is that it may be found desirable to pass all dividends and use this amount for strengthening the business.

When the amount of divisible profits has been determined, there remains the apportionment of the respective shares to capital and labour. In most instances the employer determines this apportionment at the outset, announcing that perhaps 50% or 40% or 33⅓% of the divisible profits will be distributed among employees according to their earnings. Often, however, divisible profits are distributed according to the ratio of (1) total invested capital to total payroll or (2) interest on invested capital to total payroll. Assuming, in the example given above, that \$120,000 remains to be divided, the ratio in the first instance is \$1,000,000 (capital) to \$100,000 (payroll) or ten to one, which allots \$10,000 to labour and \$109,000 to capital. In the second case, assuming 6% as a fair return on the investment, the ratio is \$60,000 (interest) to \$100,000 (payroll) or six-tenths to one, in which event labour's share is \$75,000 and capital's share is \$45,000. This latter method of division in 1921 was known to obtain in only one establishment.

An almost universal rule is that length of service shall be a condition of the eligibility of participants. In one or two cases the employee benefits as soon as hired. But most schemes require from three months to three years of continuous employment as qualification for a share in profits. Concessions from the specification of "continuous" employment are sometimes made to provide for such contingencies as sickness, unavoidable lay-off and accidents. Discharge for cause or quitting employment entails an automatic forfeiture of all claims to accumulated or accruing shares in profits; in one plan discharge for cause is the only occasion for forfeiture. The obvious intent of such regulations is to reduce labour turnover by rewarding the faithful. In this respect profit-sharing indirectly acts as a length-of-service bonus. A further rule as to eligibility in some plans is to require a written application from the employee who wishes to participate. In one such case employees are obligated to share in possible losses, not to exceed 10% of their earnings, 10% of their pay being held back by the employer each week to provide for this contingency. Loss-sharing in addition to profit-sharing is incorporated in four schemes. Still another restriction is as to the class of work performed, as shown by the amount of salary or wages or by classification of employment. Firms using this restriction evidently feel that the type of their workmen is such that only a sharing limited to some of their employees would produce the desired results. Yet there is also the wish to experiment fully and the desire to extend the benefits of the plan, should limited participation be successful.

The form and time of payment of shares to employees are also important variants. Over three-fourths of the firms studied in 1916 paid their shares fully in cash, annually, semi-annually or quarterly. The others paid part in cash, part in company stock, or paid part into a common welfare fund or savings account. The stock-sharing or co-partnership plans provided many restrictions designed to encourage thrift, and to discourage speculation and absentee ownership. These restrictions take the form of prohibitions of sale of stock, sometimes only with the consent of an official of the company, or holding the stock in trust for the employee and paying him only the dividends, or of forfeiture of participating rights if such stock be sold.

Four plans provide for workers' co-partnership committees, though there are several strictly stock-purchasing plans which allow shareholding employees to acquire a voice in management through the exercise of the ordinary voting rights of shareholders. The extent of the co-partnership in these forms is negligible.

All these varying details (and the variations are by no means exhausted in this recapitulation) reveal in large measure the spirit and purpose of profit-sharing. As a rule the employer announces his plan without previously consulting his employees. There is virtually unanimous agreement among successful profit-sharing employers that the co-operation, loyalty and stability of working forces—the chief avowed purposes of profit-sharing—are obtained by all the plans which have been in operation for any considerable period. There are, however, varying opinions as to how far these plans attain the more specific objects of (1) economy of time and material, (2) improvements in quality and quantity of output, (3) inducement to thrift, (4) avoidance of industrial disputes, (5) attainment of social justice. On the whole there is a considerable body of employers' opinion supporting the value and practicability of profit-sharing in improving industrial relations.

On the other hand union leaders universally condemn profit-sharing for three general reasons: (1) Where profit-sharing exists, wages less than the market rates are paid; (2) workers prefer a fair, fixed wage scale rather than a part of their wages undetermined and subject wholly to the employer's decision; (3) labour organization is undermined, as obligations to the firm are made a first lien on the workers' loyalty. That these criticisms have some foundation in fact is proved by the high percentage of abandoned plans and the reasons for their failure. Most of the failures were due to apathy or open hostility on the part of the workers, expressed in strikes, to diminished profits, or to changes in ownership of the business.

The success or failure of profit-sharing plans depends on circumstances not touched by the profit-sharing principle. Where favourable results have been obtained, they were due, not to profit-sharing as a mechanical device, but to the confidence which the employees had in the management.

**Bibliography.**—A comprehensive bibliography will be found in Boris Emmet's report "Profit-Sharing in the United States"—United States Bureau of Labor Statistics, Bulletin No. 208, 1917. **PROHIBITION.**—In the earlier article (see 26.578) under TEMPERANCE, reference has already been made to the various methods devised for securing total abstinence from the consumption of intoxicating liquor, and in particular to the progress of the movement for legislative Prohibition in the United States up to the year 1910. This latter movement eventually culminated in the establishment of nation-wide Prohibition by the Eighteenth Amendment to the Constitution of the United States, as proposed by Congress, Dec. 3 1917, ratified by the necessary three-fourths of all the states, and officially proclaimed, Jan. 29 1919, as part of the Constitution, becoming effective, in accordance with its terms, one year from the date of ratification by 36 states, namely Jan. 16 1920.

In the separate article under LIQUOR LAWS the measures adopted in Great Britain for further regulating the liquor traffic during 1910 to 1921 are dealt with; and here it is only necessary to deal with the advent of complete national Prohibition in the United States, where its adoption forms one of the most interesting chapters in the social history of modern times. The movement for Prohibition was affected by new scientific knowledge, new views of industrial economics, and educational forces of great variety, considerably intensified, but not substantially changed in character, by the experience of the World War. The conviction had grown steadily in the United

States that social and industrial efficiency, and national unity of purpose, could not be had at any cheaper price than the cost or sacrifices involved (whatever they might be) in national prohibition; and this belief had almost reached the point where it could be translated into effective governmental action even before the war necessitated a supreme effort for such efficiency. Surprising evidence of this was seen in the passage, by a majority vote (193 to 189) in the House of Representatives, of the Hobson amendment for national prohibition, Dec. 22 1914, two years and four months before the United States entered the war. Save for the war, the country would probably not have had constitutional (which means virtually permanent) national prohibition as early as 1920. Forces were, however, at work which would have probably brought it within another decade, and with it the "bone dry" enforcement contemplated in the National Prohibition Act (popularly called the Volstead Act), the significant title of which is "an Act to prohibit intoxicating beverages, and to regulate the manufacture, production, use, and sale of high-proof spirits for other than beverage purposes, and to ensure an ample supply of alcohol and promote its use in scientific research and in the development of fuel, dye, and other lawful industries."

Up to the wartime legislation of 1917 and 1918 and the Volstead Act of Oct. 28 1919 for the enforcement of the Eighteenth Amendment, there had been but little change since 1910 in Federal policy. Federal taxation of liquor was greatly increased for revenue purposes in 1917 and 1918. The increasing sentiment in favour of prohibition throughout the country was reflected, however, in other Federal measures. In 1913 the Webb-Kenyon Act was passed, over President Taft's veto. It was based on the constitutional grounds that the Act delegated power over interstate commerce, exclusively vested in Congress, to a state, by making illegal the shipment of liquor from a "wet" state to a "dry" state contrary to the laws of the latter. Some such measure seemed necessary in order that local prohibition might be enforced in "dry" territory. Another indication of national sentiment in favour of restriction is found in the same year in the passage of the Jones-Works Excise Bill for the District of Columbia, which reduced the number of licensed saloons by Nov. 1 1914 to not more than 300, about half as many as before. The Isthmian Canal Commission on July 1 1913, by an administrative order previously adopted, abolished 35 saloons in the Canal Zone by declining to issue any further licences for the sale of liquor. In 1915 absolute prohibition for the District of Columbia was proposed in a rider to an appropriation bill, and defeated in the Senate by a small majority, and in the same year a bill for that purpose was favourably reported in the Senate by the Committee on the District of Columbia. In 1916 the Judiciary Committee of the Senate reported, 13 to 3, a resolution proposing the National Prohibition Amendment to the Constitution. A similar resolution received a majority vote in the House of Representatives in Dec. 1914, though it failed to secure the two-thirds necessary for passage. During the years 1915 and 1916 many of the states had enacted statewide prohibition laws, and there was a considerable extension of dry territory under local option in wet states.

Early in 1917 Congress enacted the Federal Anti-Liquor Advertising Bill with the so-called Reed Bone-Dry Amendment, as an amendment to the Post-Office appropriation bill. This was a drastic prohibition of the use of the mails for advertising, or soliciting orders for, liquor in "dry" territory, and was an extension of the principle of the Webb-Kenyon Act. Congress also adopted prohibition for the District of Columbia, over which it has exclusive legislative power. It provided for prohibition in Alaska to be effective Jan. 1 1918, and in the Porto Rican Citizenship and Civil Government Act it made provision for a referendum in Porto Rico on prohibition. This was held in July 1917, and resulted in a vote of 99,775 for prohibition to 62,195 against. All this action by Congress took place before the declaration of war in April, 1917. Following that declaration came the enactment of wartime prohibition in the Food Control Act of Aug. 10 1917, the liquor restrictions of the draft law of

May 18, and the extension of their application in the Act to promote the efficiency of the navy, approved Oct. 6 1917. These measures are discussed later in the section on wartime legislation.

Quite apart, however, from war legislation, on Aug. 1 1917 the Senate adopted the resolution proposing to the states the National Prohibition Amendment by a vote of 65 to 20—more than two-thirds of the members present, and this resolution was adopted by the House with some amendments Dec. 17 by a vote of 282 to 128. On Dec. 18 1917 the Senate concurred in the amendments made by the House, and the resolution was thereupon submitted to the Legislatures of the several states for ratification. Ratified by the last of the necessary 36 states (Jan. 16 1919), and proclaimed by the Secretary of State (Jan. 29 1919), it became the Eighteenth Amendment to the Constitution, to go into effect one year from the date of its ratification, namely on Jan. 16 1920. The wording of the Amendment is as follows:—

1. After one year from the ratification of this article the manufacture, sale or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

2. The Congress and the several states shall have concurrent power to enforce this article by appropriate legislation.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of the several states, as provided by the Constitution, within seven years from the date of the submission hereof to the states by the Congress.

After Jan. 16 1919 the Amendment was ratified by all but three of the remaining states.

Whatever allowance may be made for the effect produced by the political activities of the Anti-Saloon League, an analysis of the vote in Congress for the submission of the Amendment

showed a fair proportionate representation of the people residing in "dry" territory, and also the proportion of "dry" to "wet" territory in the United States. The subsequent votes in the State Legislatures on ratification of the Amendment corroborate this view. The accompanying table shows the order and dates of ratification by the several states, and the vote in each House of the State Legislatures by which ratification was enacted. The total number of votes in the state Senates or upper Houses, for ratification, was 1,297 in favour and 236 against, or 84% for national prohibition to 14% against; in the lower or more popular branch of the state Legislatures, the total vote for prohibition was 3,742, or 78%, to 1,001 or 22% against. It will be noted that in South Dakota, Idaho, Washington, Kansas, Utah and Wyoming no votes were cast against ratification.

The three states which had not ratified the Eighteenth Amendment to Sept. 1921 were Connecticut, Rhode Island and New Jersey. That the ratification of the proposed amendment failed in all three states by a very narrow margin is seen from the following facts. Rhode Island's State Senate by a vote of 20 to 18 on March 2 1918 postponed indefinitely the consideration of the ratification resolution; the resolution was presented again at the 1919 session, when the Senate voted 25 to 12 to postpone indefinitely its consideration. In Connecticut the Senate voted 14 for ratification and 20 against, and the House 153 for and 96 against. In New Jersey the House passed the ratification resolution, Jan. 24 1921, by a vote of 52 to 4, but the vote in the Senate on April 7 1921 was 10 in favour to 8 against, and the resolution failed because the state Constitution required at least 11 affirmative votes in the Senate as then organized.

Following the adoption of the Amendment came the Volstead Act, which was passed over President Wilson's veto on Oct. 28 1919. Before that, however, in addition to further war legisla-

\*Repassed in Lower House to correct error Jan. 23.

tion affecting the liquor traffic, Congress enacted in 1918 prohibition for Hawaii and in 1919 a bone-dry law for the District of Columbia.

National prohibition was proclaimed Jan. 29 1919, and the year of grace allowed by the Eighteenth Amendment for it to go into effect was intended to give liquor manufacturers and dealers time in which to liquidate their business and dispose of their stocks. The so-called wartime Prohibition Act, however, which was enacted 10 days after active warfare had ceased (Nov. 21 1918), became effective on July 1 1919. The production of beer, except "near-beer," had been stopped at the beginning of the year as a food conservation measure, but even after wartime prohibition became effective, 2.75% beer was manufactured in some states on the assumption that it was a non-intoxicating liquor, and because Congress had not yet defined the quantity of alcohol a beverage might contain without coming within the meaning of the word "intoxicating," as used in the various laws, regulations and administrative orders. Rhode Island, for example, enacted a state law declaring all liquors of less than 4% alcohol to be non-intoxicating.

The questions thus raised, together with the definitions of the Volstead Act declaring all liquors containing one-half of 1% of alcohol or more to be intoxicating and hence prohibited, were taken to the Supreme Court, which finally sustained both the Eighteenth Amendment and the Volstead Act's definition of intoxicating liquor, in two cases (*Hawke v. Smith* and *Rhode Island v. Palmer*, 253 U.S.) in which decision was rendered June 12 1920. The Court had previously sustained the War Prohibition Act and the one-half of 1% limit which it specified; but the liquor interests and the liquor-consuming public hoped that greater latitude would be given them by a narrower construction of the first section of the Eighteenth Amendment, which prohibited only intoxicating liquors, and therefore, it was argued, did not warrant legislation forbidding the sale and manufacture of any liquor which was, in fact, non-intoxicating, whether it contained more or less than one-half of 1% of alcohol. The Court, however, without stating or discussing this contention, cited the war prohibition cases in support of the conclusion that while "recognizing that there are limits beyond which Congress cannot go in treating beverages as within its power of enforcement, we think those limits are not transcended by the provision of the Volstead Act."

The Volstead Act provided for drastic enforcement, and arms the Government, through the Commissioner of Internal Revenue, with ample powers to punish and suppress any evasion. The regulations under this Act governing physicians' prescriptions and the procuring of wine for sacramental purposes are also drastic.

The Act supplementary to the National Prohibition Act approved Nov. 23 1921 contains still more strict enforcement provisions. It forbids physicians to prescribe for medicinal purposes other than spirituous and vinous liquor, and no physician may prescribe or any person sell or furnish on prescription any vinous liquor that contains more than 24% of alcohol by volume and not more than a quarter gallon or any quantity of such liquor containing more than one pint of alcohol for the use of any person within a period of ten days. This may seem to be an unnecessary and unwarranted interference with medical science, but it indicates that no power was likely to be refused that the administration authorities might find necessary to make enforcement effective. Other provisions giving the enforcing authorities control over importations for non-beverage purposes make it clear that both this Act and the National Prohibition Act apply to all territory subject to the jurisdiction of the United States and specifically continue in force all laws in regard to the manufacture and taxation of and traffic in intoxicating liquor and their several penalties as in force when the National Prohibition Act was enacted. Although the effectiveness and justice of these provisions cannot be accurately judged at present, they at least assisted materially towards enforcing national prohibition.

The question of the meaning of "concurrent power" to enforce the Eighteenth Amendment was also settled by the Supreme

Court in *Hawke v. Smith*, in which the Supreme Court held that the provision of the Amendment in this connexion was within the amending power, was a part of the Constitution and "must be respected and given effect the same as other provisions of that instrument," was "operative throughout the entire territorial limits of the United States" and "of its own force invalidates every legislative act, whether by Congress, by a State Legislature, or by a Territorial Assembly, which authorizes or sanctions what the section forbids." The second section of the Amendment declared that "the Congress and the several states shall have concurrent power to enforce this article by appropriate legislation." The Supreme Court said that this "does not enable Congress or the several states to defeat or thwart the prohibition, but only to enforce it by appropriate legislation. The words 'concurrent power,' in that section, do not mean joint power, or require that legislation thereunder by Congress to be effective shall be approved or sanctioned by the several states or any of them; nor do they mean that the power to enforce is divided between Congress and the several states along the lines which separate or distinguish foreign and interstate commerce from intrastate affairs. The power confided to Congress by that section, while not exclusive, is territorially coextensive with the prohibition of the first section, embraces manufacture and other intrastate transactions as well as importation, exportation and interstate traffic, and is in no wise dependent on or affected by any action or inaction on the part of the several states or any of them." The prohibitionists could scarcely have hoped for a more sweeping endorsement, and the decision may be fairly considered further evidence of the widespread popular desire for effective national prohibition.

**State Action.**—Statewide prohibition had existed in 1910 in only nine states—one of them in New England (Maine); three in the middle-west (North Dakota, Kansas and Oklahoma); and five in the south (North Carolina, Georgia, Alabama, Mississippi and Tennessee). Not till 1914 did any greater tendency to statewide prohibition show itself, with the exception of an amendment of the state Constitution of West Virginia in 1912. But during the five years 1914-9 half the states adopted statewide prohibition, and these represented every section of the country, although they did not include some of the most populous states with large urban centres. In 1914 statewide prohibition was adopted by Colorado, Oregon, Virginia, Washington; in 1915 by Alabama, Arizona, South Carolina; in 1916 by Arkansas, Idaho, Iowa, Michigan, Montana, Nebraska, South Dakota; in 1917 by the District of Columbia, Indiana, New Hampshire, New Mexico; in 1918 by Florida, Nevada, Ohio, Utah; in 1919 by Kentucky and Texas.

From 1910 to 1914, and in lesser degree until 1920, there was meanwhile a continued struggle as to local option in states where statewide prohibition was not adopted with considerable fluctuation in the proportion of dry and wet areas or counties or towns, as the case might be, within the several states, and sometimes with the further fluctuation that the same area became dry at one election and wet at the next. Local option seems to have had its first trial in the United States in Indiana as early as 1832; when in 1881 Massachusetts adopted local option after extensive experiment with prohibition and ordinary forms of licence, that state became a model for other states in its local option law; local option in 1910 prevailed in 33 states. In Pennsylvania, where the licences were granted by the courts of quarter sessions and the judges elected by the people, local option virtually obtained, because elections of judges often turned on the question of whether or not licences should be granted in a given community; and in New Jersey some communities, by reason of the provisions of special municipal charters, enjoyed the privilege of local option. It was estimated in 1910 that the extent of the dry areas of the United States was to that of the wet areas approximately as seven is to five. The total pop., however, living in dry areas was approximately 41,500,000 to 46,000,000 in the wet areas.

Outside prohibition areas and local option areas there remained little territory in 1910 under other forms of licence or regulation,

the most notable exception being the dispensary system in South Carolina, which was still in operation, however, in only six counties out of 22 that previously had state dispensaries; besides these there were 32 counties dry under local option.

Experiments with local option provided valuable tests of the spread of prohibition sentiment. A writer in the *National Municipal Review* for Oct. 1916, dealing with local option in the United States, stated that at that time 80% of the land area of the United States was under prohibition, affecting 54% of the pop. of the country; in other words that more than one-half of the pop. of the United States, spread over four-fifths of its area, was without licensed supply of intoxicants. In the 26 local option states the percentage of area made dry in that year by local legislation ranged from 18% in Rhode Island to 98.3% in Wyoming, with a median percentage of 78.5. Only three of those states had less than half their area under no licence; seven between one-third and three-fourths, and 16 more than three-fourths. Therefore, said this writer, "with 19 states wholly dry, 16 states more than three-fourths dry and 7 states more than half dry, it would appear from the map that national prohibition requiring the consent of 36 states is not far off."

**Liquor Consumption.**—Too much importance is often attached to actual statistics of the consumption of liquor as an evidence of the success or failure of local option, and of restriction or prohibition of manufacture and sale. They are by no means conclusive, and especially have slight bearing on the important question, involved in most local option and prohibition enactments, concerning the nature, character and number of saloons and places where intoxicating beverages are sold and consumed. The annexed official figures from the *United States Statistical Abstract* for 1920 give statistics for the consumption *per capita* of distilled spirits, wines and malt liquors for beverage purposes, from 1850 to 1920.

*United States Annual Consumption per capita of Distilled Spirits, Wines, and Malt Liquors, 1850 to 1920; in gallons.*

Year ended June 30	Distilled Spirits	Wines	Malt Liquors	All Liquors and Wines
1850 . . . . .	2.24	.27	1.58	4.08

\*Average for the period.

**Influences Behind Prohibition.**—The facts and figures already set forth should help to indicate what were the influences which brought together the local, state and national forces, and led to the adoption of national prohibition in 1920, as well as to its virtual enforcement as a war measure July 1 1919, throughout the area of the United States and the territory subject to its jurisdiction. The movement was not to be ascribed, as some publicists have seemed inclined to believe, to a state of exaltation induced by the war. Neither was it due to the absence of many male voters engaged in military service and perhaps not able to make their opinions effective in the matter. Prohibition had its roots and causes outside of and far antedating these sentiments and experiences. The continuously rising standard of living of the masses in both urban and rural communities from 1910 to 1918 had much influence. The industrial demands for efficiency, and the growth of scientific knowledge about its requirements, had an important and increasing effect. Americans of all classes in increasing numbers perceived that,

quite irrespective of their personal habits or desires with respect to the consumption of alcohol, they could not secure the advantages of abstinence, or of moderate and perhaps harmless consumption, on the part of the weaker and more numerous members of any community, unless they themselves were willing to forgo the liberty of personal consumption, even though they belonged to the minority whose efficiency might not in any case be seriously impaired. Enlightened opinion was also shown in the increasing regard for public health, and the measures which the nation as a whole, and the public authorities in most of its component divisions, were taking to promote it. The physiological effect of small doses of alcohol on physical strength and on mental processes had been studied by scientists for many years; and the activities of the leading life-insurance companies, during the decade here under review, in the dissemination of information with respect to personal and public hygiene, had also exerted a considerable influence upon the movement. The published statements of the life-insurance companies, analysing their mortality experience, have generally been regarded as unbiased, but have not been unchallenged or free from conflicting interpretation. Their conclusions, however, steadily served to support the total abstinence arguments as to industrial efficiency and public health, and they were widely circulated by many of the companies in such a way as to exert an effective educational influence. Mr. Arthur Hunter, actuary of the New York Life Insurance Co., in a paper read before the National Conference of Charities and Correction in Indianapolis in 1916, presented a survey of this material in which he claimed that the American statistics, many of which were then only recently available in published form, corroborated the English data in indicating that total abstinence decidedly increased longevity. He said, "the experience of the seven American life insurance companies (and one Canadian company whose records had been studied) has proved that abstainers have from 10% to 30% lower mortality than non-abstainers, and there is no good reason for believing that if the other companies compiled their statistics there would be any different result, providing the companies exercised the same care in accepting abstainers and non-abstainers."

Lastly, and of as much weight, it would seem, as all the other reasons combined, there was among all classes a growing hostility to the liquor saloon, as a mischievous agency, largely controlled and dominated by anti-social influences, and by persons and corporations actuated by a strong motive of private profit. Furthermore, the liquor saloon was gaining a power in politics, and a control of matters affecting the social life and general welfare of the people, which made its growth disproportionate to that of any other social institution in the country. The public perceived the increasing political influence of the saloon, and the failure everywhere of the various experiments to develop a substitute for it, or, indeed, to organize any other successful centre of recreation, social intercourse and community life, in competition with saloons supported and controlled by the profits of the liquor industry. A formidable body of public opinion united many persons who were neither total abstainers nor wholly convinced by the economic efficiency and health arguments against alcohol. Nevertheless they were sure that drastic measures were necessary, even if they involved heavy personal sacrifice on the part of many persons, to rid the communities in which they resided, as well as those in which they did business, of the baneful results and by-products of the saloon. Thus many who never would have voted for state prohibition, and who were even disappointed with the general outcome of local option, were prepared, when the issue was presented, to support and defend national prohibition.

**Results.**—Various efforts were made between Jan. 1920 and the autumn of 1921 to appraise the economic results and the effectiveness of the enforcement of national prohibition. But there had not yet been time to get accurate and convincing statistics or to know how to make allowance for purely accidental factors. Adjustment to the new conditions was still going on, and the existence of old stocks of liquor and wine introduced

an inevitable complication. In the case of war prohibition there was a tolerated delay of 7½ months, which the Supreme Court, in its decision upholding the war prohibition enactment, practically stated was a reasonable period, in lieu of compensation, to enable liquor dealers to dispose of liquors on hand. It was still necessary in the autumn of 1921 to depend largely upon the judgment of trained observers, who could be trusted to interpret partial but significant statistics. Of local and partial data there was no lack. *The Survey* for Jan. 17 1920, speaking of six months of the enforcement of war prohibition, said: "Thus the fact of national prohibition comes to pass without any of the dire disasters predicted—great bodies of men are not jobless; the breweries are not idle, but have turned to the making of soft drinks and ice cream; labor has not refused to work without beer. . . ; real-estate values have not slumped; in fact, the rentals charged to cigar stores, soda fountains, lunch counters, groceries and such like which are moving into the vacant saloons with all possible speed, are higher than they were; there has not been a reign of terror by outraged men demanding the return of their personal liberty." Another study made by *The Survey* and published Nov. 6 1920, of the city of Grand Rapids, Mich. (located in a state under constitutional prohibition since 1916), says that Grand Rapids in 1920 was practically free from drunkenness if not from drink; prohibition had all but emptied the county gaol; the county farm had run down for lack of prison labour; the police force had been greatly reduced; the withdrawal of liquor from dance and social halls had closed prolific sources of immorality and crime; and the number of arrests in two years had been cut in half.

A study under the direction of the Federal Council of Churches was made by the head of a social settlement in Buffalo, who visited eight cities, including three of the largest—New York, Philadelphia and Chicago—and the smaller cities of Washington, Harrisburg, Columbus, Detroit and Buffalo, examining the police returns, hospital returns, reports of lodging houses, charitable and community organizations, during the month of April 1920. Most of his material is from official sources and shows a decrease in the number of arrests in cities far apart, which cannot be explained by the operation of the usual causes of fluctuation. Apparently prohibition was the only factor common to all of these returns and operating upon them alike. Other reports, from many sources, of similar character show that throughout 1920 arrests for drunkenness and for all crimes in the principal cities diminished. In Philadelphia the total for the dry six months of 1919 compared with the wet six months of that year showed a decrease of 40% (47,000 to 28,530), and the chief resident physician of the Philadelphia General Hospital stated that there had been no increase in the use of drugs since prohibition.

Fifty-nine cities of the United States having a pop. of 30,000 or over and a combined pop. of over 20,000,000 (including New York, Chicago and Philadelphia) give the following official figures for arrests for drunkenness in the four successive years 1917–20: 316,842, 260,169, 172,659 and 109,768. Indiana shows 70% fewer arrests in 1920 for drunkenness than in 1917, the last year when the state was wet, for 39 cities with a combined pop. of nearly one million. Boston reports 5,000 fewer arrests in 1920 for all causes than for drunkenness alone in 1919; the state of Massachusetts reports 32,580 arrests for drunkenness in 1920 compared with 77,925 in 1919; Connecticut had 943 arrests for drunkenness in 1920 against 3,777 in 1919; New York City a decrease from 14,182 in 1917 to 5,813 in 1920; St. Louis a decrease from 2,605 in 1919 to 691 in 1920. A similar tendency in many cities is apparent in the returns for 1920.

Since prohibition, high wages and continuous employment came together during the year July 1 1919 to June 30 1920, it is difficult to state with certainty which of the three was the cause, or the major cause, of the increase in savings bank accounts, or of the decrease in industrial accidents reported during that period. An official statement of the Comptroller of the Currency given out in Washington Jan. 22 1920 stated that in national banks alone 880,949 new accounts were opened in the first 4½

months of the fiscal year beginning July 1 1919, and that the increase in the number of depositors in state and private banks, though not available, was known to be far greater than the increase of depositors in national banks. The Comptroller's official report (*48th Annual Report*) for the year ended Oct. 31 1920 states: "In the number of depositors or deposit accounts in national banks all previous records were exceeded, official reports showing that on June 30 1920 there were 20,520,177 deposit accounts in all national banks. This was an increase of 2,279,877 (12½%) over June 30 1919. There is now approximately one depositor in the national banks for every five of our population."

The most disinterested and intelligent observers, accustomed to judging public conditions and social facts, differed widely in their verdicts on prohibition, its economic results and general benefits or disadvantages to the public welfare in the first year of national prohibition. That is likely to be true for several years to come. The more authoritative opinion, however, seemed to be that the first effects had been generally beneficial; that the popular sentiment in support of effective prohibition was gaining in strength, and that the experiment would be continued and developed. The fears of lurking danger to social institutions or to the moral integrity of the people (which some critics believed to be inherent in prohibition), seemed likely to be outweighed by the economic and political advantages of freedom from the saloon, and the semblance, at least, of more orderly communities, less petty crime and less abject poverty. The majority of moderate drinkers seemed to be willing to sacrifice their personal liberty for these desirable results. The intemperate constitute a minority as compared with the total abstainers plus a majority of those who had been moderate users of intoxicating beverages, and their number may be expected to diminish from year to year. The business interests which were thought to be menaced by prohibition found, at the time when national and wartime prohibition went into effect, means of readjustment without great loss and without inflicting on the nation the burden of any scheme of compensation. The outlook for the future was in 1921 one of hope that new forces and new funds had now been released, which might be directed to providing normal recreation and facilities for social and community life which the saloon did not provide, but for which its very existence had precluded other provision being made.

**U.S. War-emergency Measures.**—After the entry of the United States into the World War, Federal legislation began with the Draft law of May 18 1917, Section 12 of which authorized the President to make regulations for the prohibition of the sale of alcoholic liquors in or near military camps and to officers and enlisted men of the army. An Act to promote the efficiency of the U.S. navy, approved Oct. 6 1917, extended these provisions to include the navy and all places for training and mobilization connected with the naval service. This section made it unlawful to sell or supply intoxicating liquors to any military or naval station, cantonment, camp, fort, or officers' or enlisted men's club, or to sell intoxicating liquor, including beer, ale or wine, to any officer or member of the military force while in uniform. The Food Control Act of Aug. 10 1917 prohibited the use of foods, fruits or food materials in the production of distilled spirits for beverage purposes, but authorized the President to prescribe rules for their use in the production of distilled spirits for other purposes. It provided also that distilled spirits should not be imported into the United States, and that whenever the President should find that limitation, regulation or prohibition of the use of foods, fruits or food materials in making malt or vinous liquors for beverage purposes, or that the reduction of the alcoholic content of such liquors is essential for food conservation, he should be authorized to prescribe and give public notice of such limitation, prohibition or reduction as might be necessary. This Act also authorized the President to commandeer and pay for distilled spirits needed for the manufacture of munitions or military supplies.

The so-called War Prohibition Act, enacted Nov. 21 1918, 10 days after the signing of the Armistice, was an amendment to the Agricultural Appropriation Bill, and provided that from June 30 1919 until the conclusion of the war and of demobilization, the date to be determined and proclaimed by the President, it should be unlawful to sell for beverage purpose any distilled spirits or to withdraw distilled spirits from bond except for export. It also provided that after May 1 1919 no grains, cereals, fruit or other food products should be used in the manufacture or production of beer, wine or other intoxicating malt or vinous liquor for beverage purposes, and after June 30 1919 no beer, wine or other intoxicating malt or vinous

liquor should be sold for beverage purposes except for export, until the conclusion of the war and of demobilization, the date to be determined by the President. This Act also prohibited the importation, from the date of its approval until the period of its termination, of distilled malt, vinous or other intoxicating liquors. The President was further authorized by the Act to establish zones about coal mines, munition factories, shipbuilding plants or wherever necessary to facilitate war work, in which strict prohibition should be made effective under heavy penalties. This Act continued in force until national prohibition came into force by reason of the refusal of the President to declare demobilization to have been completed before that date, and the section of the Act authorizing the President to establish special zones as above described was incorporated from a joint resolution of Congress, having the force of law from the earlier date of Sept. 12 1918.

The Prohibition Enforcement Law or Volstead Act, enacted Oct. 28 1919, three months before national prohibition came into effect, provided for the enforcement of both the War Prohibition Act and the Eighteenth Amendment. The President exercised the powers conferred on him under the Food Control Act of Aug. 10 1917, and under it the manufacture of distilled spirits in the United States was prohibited on and after Sept. 8 1917. Through the Food Administration the President also stopped the use of food materials in the manufacture of beer on Dec. 1 1918. All these measures were strictly enforced and achieved their major purposes by securing conservation and the maintenance of discipline and sobriety in all places where men in uniform were stationed. They did not affect the civilian population because of the short period of prohibition of manufacture, and because of the existing stocks in territory where local or state legislation permitted its sale. No state legislation was necessary to carry out the purposes of the special war period restrictions. (S. McC. L.)

**PROPAGANDA**, the term applied to a concerted scheme for the promotion of a doctrine or practice; more generally, the effort to influence opinion; by a false analogy from such plural words as "memoranda," frequently applied to the means by which a propaganda is conducted. The objective of a propaganda is to promote the interests of those who contrive it, rather than to benefit those to whom it is addressed; in advertisement to sell an article; in publicity to state a case; in politics to forward a policy; in war to bring victory. This differentiates it from the diffusion of useful knowledge; the evangel of a mission; publication of the cure for a disease. In such objectives there may be a secondary advantage to the contriver, but to benefit the subjects of the effort is the leading motive. Similarly those engaged in a propaganda may genuinely believe that success will be an advantage to those whom they address, but the stimulus to their action is their own cause. The differentia of a propaganda is that it is self-seeking, whether the object be worthy or unworthy, intrinsically, or in the minds of its promoters.

Statements or arguments known to be self-interested tend to raise suspicion. A wide examination of propagandas supplies an empirical argument in justification of such an attitude. Indeed, casuistically considered, indifference to truth is a characteristic of propaganda. Truth is valuable only so far as it is effective. The whole truth would generally be superfluous and almost always misleading; the selections made range from a high percentage to a minus quantity. The time factor is vital. If a quick sale or a decisive victory is possible, opportunism may be more useful than exactitude. If a permanent market is to be opened or a protracted campaign is expected, caution is required in suppression or in misstatement. Although truth may thus be irrelevant to the success of a propaganda, it does not follow that those engaged in it are consciously unethical. Doubtless, in every effort to control opinion, there are persons either indifferent to justification, or who justify the means by the end. But the more the emotions are excited, whether by patriotism or by cupidity, by pride or by pity, the more the critical faculties are inhibited. It is a quality of propaganda, as of counter-propaganda, that high-minded persons on both sides commend their cause by identical arguments, and that high-strung persons soon come to believe what they wish to be true. Their character and their enthusiasm lend weight to many partial statements, or even make false coin ring true.

The suspicions aroused by an admitted propaganda lessen its effectiveness, from which it follows that much of the work has to be furtive. Part of the task, and that the more easy, is to whip up existing inclinations, but the more arduous and the more

frequent duty is to reverse or to create opinion. Efforts are therefore made to present "tendencious" matter as impartial. The simplest case is seen in the familiar methods of newspaper advertisement. The crudest form is a direct printed recommendation of an object, obviously paid for. More subtle, but still plainly a paid advertisement, is a general paragraph in the "News" columns, with the letters *Adv.* at the foot. Best of all is commendation in the editorial columns or description disguised as news, these methods being seldom adopted in the responsible Press of the better kind, but familiar in organs subsidized to support an interest, possibly with a free hand on everything except that interest.

The methods of a propaganda are limited only by the resources and the ingenuity of its promoters. They may be studied in their most intensive form in the propagandist efforts during a war; the magnitude of the object secures the necessary funds, and at the same time attracts the services of persons of more intellect and character than would usually devote themselves to such a pursuit; in the atmosphere of war, moreover, truth, like many other fine qualities of humanity, is judged by expediency, with varying answers.

The use of propaganda in war dates from remote antiquity. It is plain that Herodotus, with his alert and modern mind, suspected the possibility of "working" the oracles whose pronouncements had so great an influence. But in *Urania VIII.*, 22, he describes a propagandist effort made in the Persian War by Themistocles, son of Neocles, which in intention and method might have occurred in the recent World War:—

"Themistocles, having selected the best sailing ships of the Athenians, went to the places where there was water fit for drinking, and engraved upon the stones inscriptions, which the Ionians, upon arriving next day at Artemisium, read. The inscriptions were to this effect: 'Men of Ionia, you do wrong in fighting against your fathers, and helping to enslave Greece: rather, therefore, come over to us; or, if you cannot do that, withdraw your forces from the contest, and entreat the Carians to do the same. But if neither of these things is possible, and you are bound by too strong a necessity to revolt, yet in action, when we are engaged, behave ill on purpose, remembering that you are descended from us, and that the enmity of the barbarian against us originally sprang from you.' Themistocles, in my opinion, wrote this with two objects in view; that either, if the inscriptions escaped the notice of the king, he might induce the Ionians to change sides and come over to them; or, if they were reported to him, and made a subject of accusation before Xerxes, they might make the Ionians suspected, and cause them to be excluded from the sea-fights." (Herodotus VIII., *Urania* 22.)

Propaganda on similar lines has been conducted in almost every war in history, but until the World War (1914-18) chiefly as a subsidiary part of the actual military or naval operations. Clausewitz, the Polish-Prussian officer (1780-1831) whose works on the conduct of war were translated into most modern languages and formed the basis of most military theory, laid it down partly as a prediction and partly as a precept that war must be waged with the whole force of a nation. Military propaganda may therefore be defined as the attempt to add the psychological factor to the other resources of warfare. It may be considered formally under four heads:—(1) Control of Home Opinion; (2) Control of Neutral Opinion; (3) Control of Allied Opinion; (4) Control of Enemy Opinion. Counter-propaganda is the effort to counter the operations of the Enemy.

(1). *Control of Home Opinion*.—In modern times even the most autocratic ruler or state cannot hope to conduct a protracted war, or a war that brings a great burden on a nation, or a war that sways with doubtful success, unless public opinion is favourable. A large part of propaganda must therefore be for home consumption. It will proclaim the certainty of victory, describe actual and prospective military and naval triumphs, obliterate or explain reverses. It will vaunt economic strength, financial resources, power of organization; it will explain difficulties in the supply of food and raw materials, give the reasons for vexatious regulations and interferences with the ordinary routine of trade. When the war appears to be going unfavourably, it will urge the need of endurance. But it will not neglect the moral appeal. It will insist that the war is one of defence, or at least for an unselfish purpose; that victory will be for the good

of the world, will be a permanent triumph of right over wrong. At the same time, according to the mentality of the nation, it will insist on historical military glory, on the pursuit of the national aspirations such as recovery of ancient rights, redress of old wrongs, material benefits to be derived from victory, appalling consequences of defeat. The outrageous conduct of the enemy, his unnecessary cruelty, his breach of international law are all important.

(2). *Control of Neutral Opinion.*—The propaganda addressed to Neutrals covers much of the same ground, with the least possible stress on the interested motives, much stress on the defensive and inevitable sides of the war, the certainty of victory and its benefit to all humanity. Very careful attention is devoted to explaining as necessities all the steps that have interfered with the rights of Neutrals or have been positively harmful to them. Much care is given to exposition of the thesis that victory would also be to the benefit of the Neutrals.

(3). *Control of Allied Opinion.*—This is of great difficulty and of increasing importance with the prolongation of a war. It is necessary to anticipate points of friction, gloss over points of diverging interest, pay very careful deference to the Allied contribution to the common cause and to the absolute identity of interest. In the World War many mistakes were made in this aspect of propaganda, but by none more conspicuously than by the Germans, whose treatment of their Allies was marked by compulsion rather than by persuasion.

(4). *Control of Enemy Opinion.*—The efforts in this direction fall under three main heads.—Insistence that victory is certain and that prolongation of the war is only increasing the inevitable disaster to the Enemy. Attempts to stir up disaffection amongst the Enemy's Allies; attempts to stir up internal trouble in the Enemy's country.

The four sub-divisions enumerated above cover the main purposes of both propaganda and counter-propaganda, but they are only formal, and it is of vital importance to remember that under modern conditions a propaganda cannot be limited to the group for which it was intended. The most rigid censorship and scrutiny at the frontiers did not retain within Allied Countries or in Germany what was prepared for home consumption, with the result that the propaganda of one camp was often used almost without alteration as counter-propaganda in another. Neutral countries were the battle-ground in which contending propagandas met, and where statements of alleged facts and arguments came in contact.

THE BRITISH EFFORT IN THE WORLD WAR.—In the usual British fashion propaganda in the World War came into existence by the extension of the normal duties of several different bodies, with the result that there was much overlapping, as well as many gaps and considerable diversity of aim and method. From time to time new bodies were created, partly absorbing, partly replacing and partly combining the agencies in operation. Even when the Armistice came, no complete organization had been achieved, and the very great success actually obtained may be ascribed to the flexibility of the methods, the devotion of those who conducted them, and a very remarkable unity of purpose which overbore such personal rivalries as are inevitable in human affairs. A logical and consecutive account of the British propaganda is impossible. No complete organization ever existed, and as much of the most successful work was necessarily conducted secretly, and much was done by private enterprise, for instance by the spontaneous patriotism of universities, publishers, newspapers and private persons, an exhaustive description is impossible. The official side of it was conducted at first chiefly by the Foreign Office, the War Office and the Admiralty, as extensions or side issues of their normal duties. Many special missions were inaugurated by these bodies, or directly by the Cabinet.

In the beginning of 1918 a special body, the Ministry of Information, under a Cabinet Minister, Lord Beaverbrook, was created to combine and extend British propaganda with special reference to the control of Home and Neutral opinion, and another special body, the Department of Enemy Propaganda (afterwards the British War Mission), under Lord Northcliffe, for the same purpose, with special reference to control of opinion in enemy countries. Under the energetic direction of these two

great publicists and the brilliant staffs they assembled, British propaganda enlarged its sphere, increased its potential and began to approach coherence. The steps of most vital consequence, however, must be attributed to Lord Northcliffe and his staff. They were early impressed with the conception that propaganda must be closely linked with policy. With the willing co-operation of the Ministry of Information, they first secured a general unity of method and purpose in purely British work, and, next, by propaganda conferences in London, extended a similar unity to British, French, Italian and American propaganda. Still later, as the war appeared to be nearing its end, they formed a general committee containing representatives of all the great Departments of State and worked out a Peace Propaganda Policy, to which the assent of the British Cabinet was obtained and which was at once made the basis of all British propaganda. Arrangements had been made for another conference of Allies in which the British Peace Propaganda Policy was to be co-ordinated with the policy of our Allies, when the signing of the Armistice made further effort of this kind unnecessary. Later in this article the steps which led to this ultimate co-ordination will be described more fully, or will become more apparent as the scattered agencies which led to it have been explained. But it is pertinent here to observe that the final stage, reached by slow experience, should have been the initial stage. In any national propaganda, the national policy, if such indeed exist, should be within the cognizance of those who have to create and direct the machinery for endeavouring to control opinion.

From the outbreak of the war in 1914 to the end of 1915, the official organization of British propaganda was highly tentative. The task of creating and directing public opinion during war had never before been a function of British Governments and did not consort well with the national traditions. In the first months of the war, during Mr. Asquith's Ministry, a War Propaganda Bureau was set up in the National Assurance Offices at Wellington House; a Neutral Press Committee, with special reference to Cabling was established under the Home Office, and a News Department, to deal with the Press, was formed by the Foreign Office. Gradually these three departments came more under the authority of the Secretary of State for Foreign Affairs; but they operated to a large extent as independent agencies without central control.

The Admiralty and the War Office had to exercise strict control over the publication of news relating to actual or proposed operations and other matters relating to the navy and army. The censorship which they had to exercise strictly for military reasons, gradually acquired a wider purpose and passed into a dissemination of news essentially propagandist. The direct effect of this bias given to news was upon home opinion, but naturally passed from home countries to neutrals, and from neutrals to enemies. It had therefore the legitimate objects not only of concealing what it was useful to conceal, but of making suggestions which might deceive. From indirect or accidental propaganda, it passed over to deliberate propaganda. Similarly the official representatives of the Foreign Office in Allied and neutral countries quickly found that their routine duties of explaining the intentions of the British Government, and of assisting public and private British interests, necessarily acquired a propagandist bias. As there were obvious inconveniences in this course, the propagandist activities in foreign countries gradually became detached from the official diplomatic activities, and acquired direct relationship with special departments at home. A similar series of events took place in the case of the representatives of the British army and navy in foreign countries, especially those attached to the Secret Services. As their efforts became more propagandist, it was convenient to separate them. Thus in various ways a propagandist service crystallized out of normal services.

During this period, and, indeed until the end of the war, the voluntary work of the great newspapers and publishing houses made an important contribution to British propaganda. It is perhaps necessary to insist on the voluntary side of this work. It has never been the tradition of the British Government to

subsidize or to control the British Press, and although some efforts were made in that direction, they were signal failures. The great newspapers and the great publishing houses jealously maintained their independence and their right of criticism; they were willing to accept censorship so far as it was supposed to prevent the leaking of information that might be of service to the enemy. But they fought bitterly, and successfully, any attempts of the Censorship to overstep the bounds of military needs. (See CENSORSHIP.) The independence of their attitude and the strength of their patriotism combined to make their voluntary propagandist effort of the utmost importance.

*Ministry of Information.*—It will be convenient to deal first with the grouping of propagandist agencies under the Department, later the Ministry, of Information, as this body was the first to combine a number of scattered bodies under one direction, although, as will be shown later, the War Office, under the Directorate of Military Information, created earlier an extensive propagandist headquarters.

The Department of Information was formed by a resolution of the War Cabinet on Feb. 20 1917. According to that resolution its object was to take over and unify the various foreign propaganda activities, and to act as a general publicity bureau under the War Cabinet. Col. John Buchan was brought back from France and appointed Director of Information. Propaganda thus acquired its own specific organization separate from other Government Offices and directly under the Prime Minister. There was necessarily much overlapping with the War Office, but on the whole the Department of Information worked toward the control of civilian opinion, the War Office to that of military opinion; the former concentrated attention on political and general subjects, the latter on military subjects.

The Department of Information, during the time of its existence, covered the work of British propaganda in Allied, neutral and enemy countries. It was arranged in four sections:—

- (a) An administrative section, divided into branches, corresponding to the different countries, each branch being under the charge of an official who was a specialist in that geographical area.
- (b) A producing section which dealt with literature and art and was virtually a large publishing establishment.
- (c) A producing section concerned with cables and wireless and the distribution of cinema films and press articles.
- (d) A political intelligence section, which provided reports upon political and civil matters in foreign countries.

Foreign propaganda was conducted (a) among foreigners on a visit to Britain or resident there as correspondents, and (b) in the foreign countries themselves. (a) The first task involved hospitality, to foreign visitors, the securing of facilities for Allied and neutral correspondents, and the arranging of visits to the British front, the British fleet and other centres of interest for writers and public men from Allied and neutral countries. Three châteaux on the western front were used for guests by the Department of Information—one for American visitors, one for the Allied and neutral press, and one for visitors in general. A large number of distinguished foreigners were invited to Britain, since it was held, with reason, that the best propaganda in any country was that done by the citizens of the country themselves. (b) Propaganda in foreign countries was conducted by the issue of a very large number of publications in different languages, including pictorial journals, pamphlets and books. The *War Pictorial* was issued monthly in eight editions with a circulation of over 700,000. Six oriental papers were published fortnightly in different languages, and the Department published fortnightly journals in Spanish, Greek, and Portuguese. Exhibitions of photographs and war films were arranged throughout the world. Over a million words of propaganda material a month were cabled by Reuter, and there were also daily cable and wireless messages sent from the Department. An average of 400 articles per week was sent out to the foreign press. Bureaux of Information were established in the different Allied and neutral countries, which assisted to distribute the material prepared by the Department, and also acted as intelligence centres. A special section dealt with propaganda in enemy countries by means of articles and cables

printed in the newspapers of adjacent neutral States, and by aeroplane and balloon distribution on the different fronts.

The organization of the Department of Information obviously left much to be desired. In the first place it was not a ministry and had no ministerial head. This led to two disadvantages: the War Cabinet had little time to spare for the supervision and direction of its policy, and in dealing with other ministries it lacked the prestige necessary to safeguard its interests and enforce its requirements. Again, it had no single domicile, being housed in four different parts of London; and this led not only to a great deal of delay in its work, but prevented it being organized according to the normal plan of a Government office.

The Ministry of Information was constituted on March 4 1918, with Lord Beaverbrook as minister. It took over the whole organization of the old Department of Information, with the exception of the Political Intelligence branch, which was transferred to the Foreign Office, and the section dealing with enemy propaganda (excluding Turkey and the Middle East), which was transferred to Lord Northcliffe. The new Ministry was organized on the normal lines of a Government department, and was able to draw for its increased staff upon a large number of distinguished volunteer workers. The new Ministry had four main departments:—

- (1) The Intelligence Department received and digested all information necessary to the efficient work of propaganda in the different countries, translating policy into terms of propaganda. The special cable and wireless messages which were issued daily were prepared under the direct supervision of this Department.
- (2) The Propaganda Department was in charge of the actual administration of propaganda in foreign countries. Under its director there was a section for each important country, or group of countries. Each section was in charge of a "National" at the headquarters of the Ministry, and in each foreign area there was a corresponding organization which carried on the work in that area. Over each of the main sections there was a special officer called the controller, whose business it was to supervise the work of the "Nationals," more especially with a view to the expenditure of public money.
- (3) The material for propaganda—apart from the cables and wireless, which were directly under the Intelligence Department—consisted of press articles prepared or arranged for at the Ministry's headquarters; literature in the shape of journals and pamphlets; and war photographs, films, pictures. The preparation of pictures, photographs and films, as well as their distribution, was directly controlled by the minister, and was no longer in the hands of War Office Committees, as had been the case with the old Department of Information.
- (4) The Ministry gave special attention to what might be called "personal" propaganda, securing facilities for foreign correspondents to visit British centres of interest and to meet representative British public men, and, generally speaking, the widening of sympathy for Britain's cause by the personal and social contact of Britons with the citizens of other lands. In this direction the work was large and ramified. A Facilities branch arranged for visits and entertainments; an Overseas Press Centre acted as a clearing house between all branches of the Ministry and the correspondents of the Overseas Press in this country; a special organization dealt with the entertainment of American troops in Britain. Besides the work of personal propaganda done in Britain itself, much was done by representatives of the Ministry abroad, who acted as popular and democratic ambassadors, keeping in touch, not with official, but with unofficial powers.

The nature of its duties made it impossible for the Ministry of Information to be a rigid organization like an ordinary Government office. Propaganda is not a static thing and can never be standardized, and the constitution of a propaganda department had to be adapted to so fluctuating a subject matter. Constant revision was necessary, both in material and method. Moreover, the larger part of the work of the Ministry had to be done quietly and unofficially, and without advertisement, since popular opinion in every country is so delicate an instrument that attempts to play upon it in the name of a foreign government, even an Allied Government, would without doubt have been resented. The anomalous character of its duties was reflected in the curious variety of its staff. It is probable that never before in any Government department had there been so many distinguished men of a type so remote from that of the normal official. All varieties of talent were needed—the skilled journalist and the expert in publicity for the actual business of

propaganda, the experienced business man for the control and expenditure of machinery, and the student of public affairs for Intelligence and Policy.

*Directorate of Military Intelligence.*—Until the end of 1915, the Intelligence Section of G.H.Q. (France), and the Director of Special Intelligence at the War Office, made somewhat casual efforts in the direction of propaganda at home, abroad and amongst the enemy forces, and did more in the direction of acquiring information about the propagandist activities of the enemy. The supreme military authorities, however, either attached little value to propaganda, or were more absorbed by their directly combatant functions, and gave no encouragement to the development of propaganda. In the beginning of 1916 Gen. Sir George Macdonough returned from France to become Director of Intelligence on the Imperial General Staff. Thenceforward until the end of the war, a branch of his directorate was devoted to propaganda with continually increasing intensity. Under his stimulation and with the encouragement and the active assistance of Brig.-Gen. Cockerill, his second-in-command, a small group of men, half of them regular officers and half distinguished civilians with temporary commissions, a very large and successful organization was built up. It worked in close coöperation with General Headquarters at the various fronts and with the propagandist agencies in England. Its command of material drawn from all the branches, open and secret, of the Directorate of Military Intelligence, and its close connexion with the fighting services, gave it very large opportunities, of which it took full advantage; on the other hand, the fact that it was a branch of the War Office, run on strict military lines, prevented the full extent of its activities being known, and the credit of much that it accomplished was assigned to organizations more accustomed to work before the footlights.

Reports, captured documents, photographs and any other matter with a possible propagandist use, were collected from all the fronts. Samples of all propaganda prepared by the enemy were obtained from neutral countries, through the postal censorship, by direct capture, from the navy and from all other available sources. Details of the actual fighting operations, stories from the fronts, and all matter tending to show the conditions of fighting on both sides were assembled. Letters written by prisoners of war were read in the special censorship and copies of any judged to be of utility were preserved for reproduction in *facsimile*. Illustrated booklets describing the happy conditions of enemy prisoners in British camps were prepared. The foreign press, especially that from enemy countries, was regularly read, and extracts taken. From these and similar materials propaganda was prepared for distribution, partly by the regular staff of the section, partly by distinguished civilians who gave their services, and largely by wounded or otherwise disabled officers of literary capacity seconded for the purpose. The propagandist material prepared in this way was first carefully censored from the military point of view, in case inadvertently it might contain information which it was desired to keep secret. It was next submitted, especially where it contained matter with any political significance, to the Foreign Office. It was then ready for use. A staff of linguists was maintained to examine and translate material from foreign sources which covered almost every known language. The prepared propaganda, if useful for other than English readers, was translated into foreign languages ranging from Urdu to Spanish, from Russian to Arabic.

A few examples may serve to illustrate the range covered by the War Office propaganda. A German Army Order captured in E. Africa showed contempt or ignorance of Mahomedan religious customs. It was reproduced in *facsimile*, with a translation into every known tongue spoken by Mahomedans. A pamphlet written by Dr. Liebknecht, the German socialist leader, suppressed in Germany, was reproduced in German. Photographs of German prisoners showing their miserable condition on capture, their reception in the British lines with food, chocolate and cigarettes, and their happiness in their ultimate quarters in British prisoner of war camps, were reproduced

as a small album. Letters written home by German prisoners of war, describing the comfortable conditions under which they lived, were reproduced in *facsimile*. An erroneous account of the battle of the Marne, written in Spanish for circulation as German propaganda in S. America, was followed by a correct account with exact maps, written by a British general who had been actually engaged in the battle. Every effort of German propaganda was followed and promptly countered in the same language as that in which it had been written. Perhaps the quickest exchange and counter-exchange took place through a cable and wireless service. All the messages issued by the enemy by cables or wireless telegraphy were intercepted and transmitted at once to the War Office. They were followed by a special staff, and the replies to them often reached their destinations a few hours after the originals, more often than not in time for the same editions of foreign newspapers.

Increasing attention was paid to the unification of the propaganda issued by the Allies, and to the pooling of information useful for propaganda. Regular conferences took place at British and French military headquarters in France for the purpose of coördinating propaganda. With the same object constant touch was maintained between the military propagandist staffs in London and Paris. A weekly journal, *Le Courrier de l'Air*, was prepared and issued at the War Office for circulation in the part of Belgium under German occupation. It contained information as to the progress of the war, general news, political intelligence, and much ordinary magazine reading.

Articles suited for British newspapers were offered to editors, and were freely used. These for the most part consisted of descriptions of scenes in the war on various fronts, written by officers who had been engaged in them. Similar matter, and articles covering a wider field, were distributed to English newspapers in every part of the world. A special staff watched the newspapers to observe the kind of articles that were most freely taken by each, so as to suit the supply to the demand. In the same way articles on almost every subject connected with the war were translated into foreign languages and distributed to newspapers in foreign countries. Large quantities of matter were sent to the Department of Information for distribution by their agencies, especially in neutral and Allied countries. There were several military distributing agencies in the Near East, and farther away, of which the largest was an "Arab Bureau" in Egypt. Some of these had local presses at which copy sent from London was set up, but a very large bulk of matter, especially illustrated matter, was prepared and printed in London, and sent out in bulk. According to its objective, it was distributed through vernacular newspapers, or by special agents, who smuggled it into enemy countries.

As regards distribution to enemies, a certain amount of this important side of the propagandist effort was done through the Department of Information, but the War Office itself directed the greater part of the work, especially where it was desired to reach enemy soldiers directly, or the enemy civilian population through them. From the examination of prisoners of war and by the direct admission of the German authorities it became clear that this service was highly effective. Early in 1917 the decision was made to extend considerably the work of preparing and distributing propaganda for the enemy troops on the western front. A special sub-section was created under the charge of an officer who had just completed an analysis of over 2,000 books and pamphlets of enemy origin. At that time there was no objection to the use of aeroplanes for the distribution of literature over the enemy's lines. The sub-section prepared and had translated into German a large quantity of suitable literature, much of it written by the officer in charge of the section (the writer of this article), other matter selected from the work of the Department of Information or from other sections of the War Office. Some of these early efforts were too successful; in particular the Germans objected to a cartoon with the legend "A German Family that has had no losses in the War," depicting the Kaiser and his sons in uniform, on the ground that its distribution was an offence against military discipline

Captured flying officers accused of distributing propaganda were tried in Germany by court martial and received severe sentences. Although in fact the sentences were not carried out, after negotiations had taken place through a neutral Power between the British and German Governments, the Germans let it be known that any future cases would be treated with the utmost severity. The French continued the use of aeroplanes in spite of this threat. But the British Air Ministry opposed the use of aeroplanes, partly on the ground of the "bad psychological effect of working under such threats, on young pilots and aviators," and partly on the more valid ground that the supply of trained men and of machines was no more than sufficient for the direct purposes of this branch of the forces. After an attempt, obviously impractical, to distinguish between propaganda that could not be regarded as "inflammatory" and that therefore could be distributed by aeroplanes, and propaganda that could not escape this charge, British G.H.Q. accepted the position and decided against the use of aeroplanes for the distribution of literature. The stock of literature prepared for the western front, except such small parts of it as could be used by other army devices, was transferred to the Ministry of Information and to the French army.

The War Office Enemy Propaganda Section then turned to the devising of other possible methods for the distribution of literature by mechanical means. Information was collected from all possible sources, the methods of the enemy being carefully watched. With the assistance of the Aerial Inventions Board and the Munitions Inventions Department, many devices were tried, and as soon as any had reached a promising stage, the officer in charge took it out to France, to discuss its possibilities, and, with the assistance of the intelligence officers of the army, to test it under field conditions.

A section of G.H.Q. Intelligence had obtained great success in dropping homing pigeons and other means of carrying messages on known areas where they could be found by British agents behind the enemy lines. In this work fabric balloons with timing devices for dropping loads at the required localities were employed, but the apparatus on the one hand was unnecessarily exact, and, on the other, much too costly for the distribution of literature. The Germans were found to be using very large balloons of scarlet Japanese paper which carried bundles of newspapers and other matter long distances, sometimes releasing them by slow-burning tinder fuzes. It was clear, however, that this method was haphazard, as balloons and loads destined for the neighbourhood of Verdun not infrequently dropped in Kent. Experiments were undertaken to study the lifting capacity of light balloons, the load and degree of filling that would enable them to rise to an approximately known height, and the arrangement of time fuzes so that they would liberate weights at known distances varying with the strength of the wind. At the same time experiments were made as to the shape, economical mode of manufacture and dimensions of paper balloons, and on the treatment of the paper to lower the rate of diffusion of coal-gas or hydrogen.

A large number of devices such as rockets, grenades and shells were enquired into, but were not adopted because of various objections raised against their use by the military authorities. A device consisting of a fire-balloon, the fabric of which consisted of propaganda sheets joined by strips of touch paper, seemed promising, but did not reach success.

Extensive experiments were carried out with the object of adapting an apparatus invented to distribute light bombs to the distribution of literature. It consisted of a box-kite with an automatic conveyer which carried five-pound loads of propaganda up the cable, liberated them at the required height, and automatically returned for another load, the sheets when liberated being carried to their destination by the wind. The method was extremely good; it was cheap, easy to work, and had a range of upwards of ten miles according to the strength of the wind. But objection to its use at the front was taken by the Air Force on the ground that the cable of the kite would be a danger to aeroplanes.

In connexion with the last-mentioned apparatus, extensive observations were carried out on the wind-driftage of sheets of paper of different shapes and weights, and of the methods of releasing them at height. Experiments were made from aeroplanes and from captive balloons, and the range and conditions of falling were ascertained. It was found, for example, that in a wind of approximately ten miles an hour, a bundle of 150 sheets liberated at a height of 2,500 ft., came to the ground two miles away, scattered over an area 500 yd. square. In higher winds and from greater heights much more distant ranges could be attained. The War Office Propaganda Section accordingly suggested that aeroplanes might be safely used, flying at heights proportioned to the strength of the wind, and the distance of the enemy lines, by flights well within the British lines. But this proposal also was "turned down."

By the end of 1917 it became clear that the use of paper balloons was the only method which would encounter no opposition, and attention was therefore concentrated on producing them on a large scale and on applying the experience gained in other directions to them. By far the largest bulk of propaganda distributed by the Allies on the western front was released from balloons, and it may therefore be of historical interest to describe their final form. The propaganda balloons were made of paper cut in longitudinal panels, with a neck of oiled silk about 18 in. long. Their circumference was approximately 20 ft. and their height when inflated 8 feet. They were liberated inflated nearly to their full capacity—from 90 to 95 cub. ft. of hydrogen. The weight of the balloon was under one pound, the load of propaganda four pounds. The leaflets were attached to a fuze of treated cotton, similar to the tinder of flint pipe-lighters, and burning at the rate of an inch in five minutes. The string of propaganda was tied to the neck of the balloon, and just before liberation a slit was cut in the neck to permit the escape of gas, and the end of the fuze was lighted. The weight and lift were adjusted so that the balloon could rise several thousand feet into the air before the loss of gas due to expansion would have caused a state of equilibrium. At this point the first bundle of leaflets was set free, and the process was continued until, at the end of the run, the last bundle was released. The total time length of the fuze and the attachment of the bundles to it were calculated according to the area which it was desired to reach and the strength of the wind. Experimental improvement of the "dope," by which the rate of diffusion of the gas was lowered, and the manufacture of balloons of double the standard capacity, had made runs of upwards of 150 m. practical, before the Armistice suspended operations. But the bulk of the propaganda was actually scattered over an area of from 10 to 50 m. behind the enemy lines, rest camps and villages occupied by the troops being made the chief targets. Each distribution unit at the front consisted of two motor lorries which carried the balloons, hydrogen cylinders, and personnel to convenient positions, generally from 3 to 4 m. behind the front line.

Early in March 1918, the method of balloon distribution was in full working order, and the War Office Propaganda Section resumed the active preparation of material. The reproduction of selected letters written by prisoners of war was resumed, and *Le Courier de l'Air* was enlarged and improved by the introduction of direct propaganda. A series of leaflets, known as the A.P. (Aerial Propaganda) was begun. The first of these, sent to France in March, was a complete German edition of the British Prime Minister's speech on British War Aims. This had been incompletely reported in the German newspapers, and in the new edition attention was directed to the portions which had been taken out by the German censorship; copy for other leaflets was selected from German and Austrian newspapers, was contributed by G.H.Q. (France), by the War Aims Committee, by the Ministry of Information, and by the new Directorate of Propaganda in Enemy Countries which had been established under Lord Northcliffe. But the whole series was selected, revised, edited, and produced by the War Office, and a very large proportion of the actual leaflets were prepared by the officer-in-charge. The first of the series was sent to France on

March 16, the last, number 95, on Sept. 4; of the whole series over 12 million leaflets were sent to France.

Later, in 1918, when, under the energetic direction of Lord Northcliffe, the machinery for propaganda in enemy countries was greatly increased, there was a further extension of distribution by balloons. The military successes of the Allies were being concealed from their troops by the Germans, and it was thought that quick and accurate information would further demoralize the Germans. In conference with the War Office, Lord Northcliffe's department arranged that the leaflets should be divided into two categories, "stock leaflets," the contents of which would not deteriorate by a little delay, and "priority leaflets" containing matter of urgent importance. The latter were printed three times a week and sent in editions of 100,000 direct to Messrs. Gamage, who were manufacturing the balloons and the "releases." They were at once prepared for distribution, handed over to the Military Transport Department and sent via Boulogne direct to the distributing stations. In favourable weather they were thus actually in the hands of the Germans 60 hours after being written.

But even with the best arrangements, distribution by balloon is subject to many delays from weather and other conditions. Lord Northcliffe continued to urge on the Cabinet the need of distribution by aeroplane, and was at last successful in breaking down the resistance. The writer of this article, then liaison officer between Lord Northcliffe's department, the Directorate of Military Intelligence and the Air Force, in the second half of 1918 carried through the final stages of the negotiations. The last obstacle was the fear of the Air Ministry that bundles of leaflets suddenly scattered in the air might foul the steering guys of the aeroplanes; he devised a simple mode of packing the leaflets so that they would fall as a solid bundle for 20 ft. before dispersing. On the morning of the Armistice, the first packets of propaganda made up on this system were delivered to the Air Force in France.

The methods of distributing propaganda by the Allies were ascertained in a conference held in August 1918 at Crewe House under the chairmanship of Lord Northcliffe. Aeroplanes were used by the British forces in the Near East, and by the Italians, French and Belgians on the western front. But it was clear that either lack of aeroplanes or of personnel limited their use even by those who had no objection to it. The Italians used special devices such as rockets and shells, the French were experimenting with shells and trench-mortars and were trying to manufacture balloons on the British model, and both the French and Belgians sent large quantities of newspapers and of other matter to be distributed by the British balloons. The Americans had hardly reached the actual stage of distribution before the end of the war, but they had developed a small rubber balloon with a very ingenious timing device for releasing the load. It is a reasonable assumption, however, that all these methods would be replaced by aeroplanes in any later war.

*Lord Northcliffe's Directorate.*—In Feb. 1918 the Prime Minister appointed Lord Northcliffe to be Director of Propaganda in Enemy Countries. Lord Northcliffe brought to the task a limitless faith in the possibility of controlling public opinion, a unique experience in the methods of publicity, and direct access to the Prime Minister and the War Cabinet. He selected a council of advisors and an executive staff of remarkable authority and talent, and Crewe House, in Mayfair, London, the headquarters of the new Department, quickly became the centre of far-reaching activity. A mere catalogue of the operations undertaken, and of the men who carried them out would occupy many pages.<sup>1</sup> But two names must be mentioned, as without them Crewe House would have been little more than a powerful addition to the existing propagandist agencies. Sir Campbell Stuart, a young Canadian who had been of great assistance to Lord Northcliffe on his mission to the United States of America, was selected as deputy-director of the de-

partment and deputy-chairman of the committee. Lord Northcliffe's choice was fully justified by the remarkable powers of tact and conciliation shown by Stuart, who rapidly disarmed all suspicion on the part of existing organizations, found out how to get the best work out of all of them and how to combine their efforts towards a single resolute purpose. Lord Northcliffe selected Mr. H. Wickham Steed as his chief political adviser. Steed at the time was foreign editor of *The Times*, and for many years had been the representative of that journal in Rome and Vienna. He had an exceptional knowledge of the political personalities of modern Europe, the open policies and the secret aspirations of all the nationalities great or small. He was an idealist, believing that truth and justice could bring ordered peace to chaotic Europe; a realist, conscious of the stubborn obstinacy that would yield only to force and of the ignorance that misled the accepted leaders of men. Steed provided the knowledge and lofty enthusiasm which shaped the policy of Crewe House, Stuart the conciliatory tact which made concerted action possible, Lord Northcliffe the swift judgment between contending views, the experienced instinct for what was practical, and the driving force to make the practical actual. The present writer assisted at many intimate deliberations at Crewe House; he desires to add his own observations to the varying estimates that have been made of Lord Northcliffe. The Director of Propaganda in Enemy Countries was patient in listening to the facts and arguments put before him, decisive in coming to a judgment on them, swift and powerful when action began. Steed's knowledge, Stuart's organizing tact, and Lord Northcliffe's driving force and far-reaching influence, made Crewe House different in quality and energy from any preëxisting agency.

The inspiring principle of the new organization was that propaganda should depend upon policy. It may be argued, although not convincingly, that a definite constructive Allied policy could not have existed in the earlier stages of the war, when fortunes were changing and the nature of the ultimate decision was uncertain. In any case, if a concerted policy did exist, it was unknown to those who were conducting propaganda. The wiser propagandists in most countries therefore endeavoured to limit themselves to a restricted field from which declared "war aims" and ultimate terms of peace were excluded. Rasher agents plunged, with results that were often ludicrous and sometimes disastrous. Dr. Lamprecht, the German historian, for example, confessed that the consequences of the German propaganda were often gruesome. Probably, he wrote, more harm came to the German cause from the efforts of the German professors than from all the efforts of the enemy. "None the less it was done with the best intentions. The self-confidence was superb, but the knowledge was lacking. People thought that they could explain the German case without preparation. What was wanted was organization." A single example will illustrate the results of lack of organization amongst the Allies. The French military authorities complained to the War Office that German propaganda appeared to be entering France in large quantities through England. They sent examples, and asked that precautions should be taken. On enquiry it was found that the incriminated documents were the product of one of the British civilian propagandist agencies. Doubtless it was a matter of opinion whether the French or English judgment of the efficacy of the leaflets was the more correct, but the real fault was the absence of harmonious effort. In 1918, the fifth year of the war, it became of vital importance that the Allied peace aims should be explained with a clear and unanimous voice to the war-weary enemy. It was to this purpose that Lord Northcliffe addressed himself. He used his influence first to extract from the British Government the broad lines of a definite policy, in order that the propaganda of his Department might not be in conflict with the casual and sporadic utterances of ministers, next to secure unity of purpose among the British and Allied propagandist agencies.

<sup>1</sup> *Secrets of Crewe House*, by Sir Campbell Stuart (London, 1920), gives an account of Lord Northcliffe's undertaking.

The first campaign was against Austria-Hungary. The British Government, hampered by the secret Treaty of London, hesi-

tated between the policy of working for a separate peace with the Habsburg dynasty, leaving its territory almost untouched, and the alternative of trying to support and encourage all the anti-German and pro-Ally elements in the Austria-Hungarian Empire. The objective selected by Crewe House was to support the national desires of the Czechs, Southern Slavs, Rumanes, Poles and Italians for independence, so as to form a strong non-German chain of Central European and Danubian States, and thus to encourage the disinclination of these peoples to fight for their German masters.

The chief obstacle to the policy of the British propaganda was the pledge given to Italy in 1915, to give her certain Austrian territories inhabited by Southern Slavs. In 1917, the Serbs, Croats and Slovenes had assembled in Corfu, and under the leadership of Dr. Trumbitch, president of the Southern Slav Committee, and M. Pashitch, prime minister of Serbia, had proclaimed the unity of the three Southern Slav peoples. Early in 1918, after recovery from the disaster of Caporetto had begun, the united Southern Slavs, on the initiation of Mr. Wickham Steed and Dr. Seton Watson, came into conference with leading Italians and agreed to settle amicably the territorial controversies in dispute. Lord Northcliffe took up the position at that point, and almost the first step of his campaign was to send Mr. Steed and Dr. Seton Watson to the Congress of Oppressed Habsburg Nationalities which took place at Rome with the consent of the Italian Government. Meantime he urged on the War Cabinet the need of coming to a decision between the alternative policies and of obtaining the agreement of the French, Italians and Americans to the choice. He got only a dubious and halting opinion from the British Foreign Secretary, who urged that the same propaganda could be adapted at least to the earlier stages of either policy. This indecision, maintained through the war and through the peace negotiations, led to the disastrous adventure of D'Annunzio, for the Italians, like other peoples, flushed with the unexpected joy of complete victory, forgot the wise concessions to which they had been willing when the issue was doubtful. But Lord Northcliffe's mission achieved a temporary and successful unity of purpose. A joint commission consisting of representatives of Italy, Great Britain and France, was established at the Italian general headquarters, with the special object of conducting propaganda directed to the oppressed nationalities in the Austrian armies. Representatives of committees of each of the oppressed nationalities were attached to the commission. A polyglot printing press was acquired, and large quantities of propaganda of all kinds were distributed by aeroplane, rockets, grenades and contact patrols. The latter consisted of deserters of Czechoslovak, Southern Slav, Polish and Rumanian nationalities, who volunteered for this service against their former oppressors. The effect was soon apparent. Deserters belonging to the subject races came over to the Italian armies in large numbers, so that the attack planned by the Austrians had to be postponed. Unfortunately, the complete success of the effort, apparently assured early in May, was prevented by the reactionary tendencies within the Italian Government, supported by the uncertain attitude of the Governments of France, Great Britain and the United States. But even in the face of this difficulty, the success was so great that, after the battle of the Piave, members of the Inter-Allied Propaganda Commission were received and thanked by the Italian commander-in-chief.

While this great campaign was taking place on the Italian front, the propaganda addressed to Germany was being intensified. On assuming office, Lord Northcliffe found the War Office propaganda department, described above, in full operation. Except that he at once began to press the Government to renew the original permission for the use of aeroplanes, he suggested no change in the War Office work. His committee at Crewe House, however, first with the assistance of Mr. H. G. Wells and after a few weeks with that of Mr. H. Hamilton Fyfe, set to work to frame a general propaganda policy directed against Germany, and to produce leaflets and other matter. Some of this material was given to the War Office Department; much of

it was distributed by special means chiefly through neutral countries. In July, when the work in Italy had been established on permanent lines, and Mr. Steed had returned to London, it was decided to concentrate all the production of propaganda at Crewe House, with the object of bringing it more into line with a concerted policy. Accordingly, the writer of this article was transferred from the War Office to Crewe House, but kept in touch with the War Office as liaison officer, the army requiring the agent for distribution.

The General Committee met daily at Crewe House, receiving the reports of the different branches, collecting information from all possible sources, and stimulating the propagandist work against Austria-Hungary, Bulgaria and Germany. It became more and more obvious during the summer of 1918 that the spirit of the enemy was breaking on every front, that they were alert to every suggestion as to the approach of peace, and that the supreme necessity was a clear statement of the intentions of the Allies. Lord Northcliffe, with varying success, continued to press the Government for such a definition of policy as would serve as a true basis for propaganda. The fundamental principle on which he wished to act was that when a line of policy had been sanctioned as a basis for propaganda, the Allied Governments should be asked for their assent to it, so that their propaganda departments might act in concert. Failing to obtain a clear lead from the British Government, who at that time appeared to have no definite policy with regard to any issue of the war, Lord Northcliffe convened an inter-Allied propaganda conference at Crewe House. It was attended by Lord Beaverbrook, Minister of Information, representatives of the British Foreign Office, War Office, Admiralty and Air Ministry, and by delegates from France, Italy and the United States, the U.S.A. delegation, however, being instructed to attend only as observers. The conference, after a plenary session, divided into committees to discuss details of policy, methods of publicity and methods of distribution. At a final plenary session the reports of the committees were adopted, and it was agreed that they should be submitted by the heads of the four missions to their respective Governments for approval. The conference then constituted a permanent Inter-Allied Body for the conduct of propaganda in enemy countries. Steps were at once taken to secure the permanency of contact between the propagandist agencies which had been established at the conference, and these became increasingly effective until, when the Armistice came, there was almost complete unity of action amongst the Allies.

As the possibility of peace drew nearer, it became still more urgent that propaganda should be kept free from any trace of confusion. To secure this, a Central Body, called the Policy Committee of the British War Mission, was formed at Crewe House; it consisted of representatives of Lord Northcliffe's department and of the War Cabinet, the Admiralty, War Office, Foreign Office, Treasury, Ministry of Information, Air Ministry, Colonial Office, India Office, War Aims Committee and Official Press Bureau. It decided to undertake the following activities:—Study of peace terms, study of utterances by important enemy representatives, their real significance and the nature of the response to be made to them. It had to take action almost at once, since the German Peace Note, with its reference to the publication of President Wilson's "fourteen points," required immediate attention from British propagandists. Lord Northcliffe's committee had been studying the fourteen points with a very close attention. It was plain that they could not be understood as a full recitation of the conditions of peace, and that it was therefore a matter of honesty and of prudence to define the interpretation put on them by Great Britain before accepting the surrender of Germany. This view was accepted by the Policy Committee, and, after detailed discussion, a statement drafted by the Crewe House Committee was adopted in principle. It was approved, by a representative of the Government designated for the purpose, for unofficial use as propaganda policy. Each department henceforward made it the text of its productions. As this document is of historical interest, it is here printed in full.

*Confidential.*

## PROPAGANDA PEACE POLICY

*The following conditions are indisputable:—*

In no sense shall restoration or reparation in the case of Belgium be taken into consideration when adjusting any other claims arising from the war.

1. The complete restoration, territorial, economic and political, of Belgium.

2. The freeing of French territory, reconstruction of the invaded Provinces, compensation for all civilian losses and injuries.

3. The restoration to France of Alsace-Lorraine, not as a territorial acquisition or part of a war indemnity, but as reparation for the wrong done in 1871, when the inhabitants of the two Provinces, whose ancestors voluntarily chose French allegiance, were incorporated in Germany against their will.

4. Readjustment of the frontiers of Italy as nearly as possible along the lines of nationality.

5. The assurance to all the peoples of Austria-Hungary of their place amongst the free nations of the world and of their right to enter into union with their kindred beyond the present boundaries of Austria-Hungary.

6. The evacuation of all territory formerly included in the boundaries of the Russian Empire, the annulment of all treaties, contracts or agreements made with subjects, agents or representatives of enemy Powers since the revolution and affecting territory or interests formerly Russian, and coöperation of the Associated Powers in securing conditions under which the various nationalities of the former Empire of Russia shall determine their own form of Government.

7. The formation of an independent Polish State with access to the sea, which State shall include the territories inhabited by predominantly Polish populations, and the indemnification of Poland by the Powers responsible for the havoc wrought.

8. The abrogation of the Treaty of Bucharest, the evacuation and restoration of Rumania, Serbia and Montenegro, the Associated Powers to aid the Balkan States in settling finally the Balkan question on an equitable basis.

9. The removal, so far as is practicable, of Turkish dominion over all non-Turkish peoples.

10. The people of Schleswig shall be free to determine their own allegiance.

11. As reparation for the illegal submarine warfare waged by Germany and Austria-Hungary, these Powers shall be held liable to replace the merchant tonnage belonging to the Associated and neutral nations illegally damaged or destroyed.

12. The appointment of a tribunal before which there shall be brought for impartial justice individuals of any of the belligerents accused of offences against the laws of war or of humanity.

13. The former Colonial possessions of Germany, lost by her in consequence of her illegal aggression against Belgium, shall in no case be returned to Germany.

*The following conditions of Peace are negotiable:—*

1. The adjustment of claims for damage necessarily arising from the operations of war, and not included amongst the indisputable conditions.

2. The establishment, constitution and conditions of membership of a League of Free Nations for the purpose of preventing future wars and improving international relations.

3. The League of Free Nations shall be inspired by the resolve of the Associated Powers to create a world in which, when the conditions of the Peace have been carried out, there shall be opportunity and security for the legitimate development of all peoples.

The action taken thereon by the Enemy Propaganda Committee at Crewe House was as follows: At their suggestion Lord Northcliffe made it the basis of an address to the United States officers in London on Oct. 22 1918. The Production Department of the Committee got to work on a series of pamphlets and leaflets dealing with the different points of the memorandum. The memorandum was sent to the French, Italian, and American members of the inter-Allied Body for Propaganda in enemy countries, with the request that they should take similar action on it to that taken by the British Policy Committee and bring it up for discussion at the next meeting of the inter-Allied body. Lastly they decided to prepare and give wide publicity to an article covering the whole ground of the memorandum, so that the policy could be presented in the same terms to the British people, to their Allies and to the enemy. The steps taken by Crewe House, and the corresponding action taken by other departments concerned, were reported and approved at a meeting of the Policy Committee at Crewe House on Oct. 28 1918, the last meeting actually held.

Events were moving swiftly, and Crewe House found that there was no time to carry out the original intention of cir-

culating the general statement through one of the more important monthly periodicals. It was therefore decided to ask Lord Northcliffe to give the peace policy the wide and immediate publicity possible by the use of his name and by the sources of distribution at his command. He agreed at once, and so consummated the efforts of British propaganda. On Nov. 4 1918 an article under his name appeared in *The Times* and *The Daily Mail*, *The Paris Daily Mail*, and the leading papers in Canada, Australia, New Zealand, S. Africa, Newfoundland, India, the British Dependencies, the United States of America, S. America, France, Italy, Spain, Switzerland, Holland, Norway, Sweden, Denmark, Japan and elsewhere, and very soon afterwards in Germany. The arrangements for this wide publicity were made personally by Lord Northcliffe, and the cost of cabling was borne by him. The final form of the article was due to him, but its substance represented the unanimous views of his advisory committee, the members of which he had selected, and over whose deliberations he had presided.

**ALLIED PROPAGANDA.**—The principles and methods of propaganda have been so fully illustrated in the foregoing account of the British effort, that little would be gained by a detailed description of the operations of England's Allies. France went through a history much like that of Great Britain. In the earlier stages of the war, propaganda was conducted by a number of agencies, for the most part in extension of their normal functions. As the war proceeded, concentration and intensification were achieved, ending in the work being placed under the control of a single minister with a large staff. The control of home opinion was less difficult than in England, as it was already in the tradition of the Government to regulate the dissemination of information and of official views. As, however, a considerable part of the French population was in territory occupied by the Germans, there had to be an extensive distribution of propaganda through the army and by secret agents. An intensive campaign was conducted in Alsace and Lorraine, the services of distinguished Alsations of French descent being employed with great success. Neutral opinion was influenced by special missions and by resident agents. Much care was given to French propaganda amongst the Allies. Distinguished civilians of British and American nationality were frequently invited to France, and given every opportunity of seeing the spirit in which France was making her prodigious effort and the enormous difficulties she had to face. French agents kept in close touch with British opinion of every class, and in every part of the Empire, not neglecting Ireland and Quebec. In one respect this branch of French propaganda was more far-seeing than most of the British work; it was not content with the actual problems of the war, but anticipated and prepared for many of the difficulties and possible causes of friction that might arise in the making even of a victorious peace. France early foresaw that, as German colonies were unlikely to be restored to Germany, it would be necessary for France and Britain to be in general agreement with regard to extra-European territories. The French effort to reach the enemy directly was on a smaller scale, but was similar to the work done by the British War Office. By exchange of views and materials a high degree of concord was reached.

Belgium was in the unfortunate position of being able to operate directly only in a very small part of her own territory. By direct effort, and with the willing coöperation of France and Britain, she was able to keep in close contact with her own people. The unmerited calamities which fell on Belgium secured her in advance the sympathy of neutral and Allied nations, so that special propaganda was unnecessary. Italy was rather a theatre for propaganda than a direct propagandist. She spoke with so many different voices that, except for a certain amount of direct propaganda addressed to the enemy, she was unable to explain her attitude very clearly either to neutrals or to Allies. On the other hand, she issued a series of magnificent photographic descriptions of her arduous campaigns, which explained well the immense difficulties of military operations on the Italian front, and the brilliant technical methods by which

they were overcome. The Americans devoted the same energy to propaganda as to preparation for actual warfare. Representatives were at once sent to Europe to examine and report on the methods of propaganda employed by the Allies. By Sept. 1918, an American Propaganda Department had been established with branches in London, Paris and near Verdun. Much literature was produced, and its distribution by aeroplane and by balloon had been arranged when the Armistice came.

GERMANY.—It would be difficult to say how far the exaltation of the German spirit in 1914 was due to official inspiration, or how far the long campaign of German intellectuals and industrialists, before 1914, for the aggrandizement of Germany, had inspired official opinion. In any event, the outbreak of the war let loose a flood of literature unanimous in sentiment and apparently spontaneous. Professors and pastors, politicians of every section, pan-Germans and socialists were united in proclaiming the necessity of the war and the certainty of victory. But even in these early days there were striking differences of opinion. One school urged that the war was defensive, forced on Germany by the "encircling policy" of her enemies. German militarism was a necessary consequence of a position surrounded by powerful enemies, of the Russian danger, and of English jealousy of her commercial success. As it was difficult to reconcile this theory with the actual German plan of campaign and with the fate of Belgium, much stress was laid on the theme that an offensive was only the best means of defence. When victory came, annexations were to be limited to what might be necessary for future security. Another school proclaimed the historic mission of Germany, her high culture and civilization, the advantage to the world of her victory. The great empires of the past had expanded and developed for selfish ends; Germany wished to free the seas for all the nations, and to open up the world so that all the peoples great or small could develop on their own lines. England, France and Russia had been the great oppressors of smaller nations and races; Germany would liberate them. The unification of Germany had been the first stage in a beneficent process which would lead, first, to a great federation of Middle Europe, and then to a federation of the whole world. A third school expounded a somewhat careful form of the Bernhardi and Treitschke doctrine. The great and expanding German people required land within the German Empire in which the surplus population might find room and yet remain German. Outlet must be found for German talent, organizing capacity, capital, manufactures, and the necessary supplies of raw material must be forthcoming. These objects Germany would have preferred to attain peacefully. But she was a late arrival on the world-scene, and her rapid development had aroused such envy, particularly from England, that her legitimate rights could be secured only by force. Yet a fourth school, relatively small in numbers but of great influence in the navy, army and among the big industrialists, appealed directly to cupidity. The riches, natural resources and possibilities of all parts of the world in which German influence could be extended or which Germany could take from her enemies were described elaborately. The growth of the British Empire was displayed in almost affectionate caricature as an accomplishment of successful piracy; England, however, must now disgorge to the younger and stronger pirate. It was an odd but possibly significant circumstance that, in all these diverging views, little attention was paid to the events immediately preceding the various declarations of war.

So far we are dealing with the unofficial home propaganda of Germany. It consisted to a much larger extent than in Great Britain of books and pamphlets, some of which doubtless were subsidized, but most of which apparently were spontaneous. These served also for the German peoples in foreign lands, and were exported in very large quantities, often in their original form, often in translation so as to serve as propaganda for neutrals. It was a characteristic of German self-confidence that they appeared to think that explanations good enough for Germans were good enough for neutrals and even for enemies. But in addition to such private or at least apparently unofficial efforts, there was an official propaganda on a large and highly

organized scale. The German Press was organized for war, with the object not only of influencing home opinion but neutral opinion, directly through the circulation of German papers in Switzerland, Holland, and Scandinavia, and by their effect on foreign editors. Dr. Theodor Wolff, the well-known editor of the *Berliner Tageblatt*, said that "German censorship passed news concerning facts, but forbade discussion of war events or internal politics and of many other subjects." The Government suppressed criticism or the giving of information with regard to the internal conditions of the country. Every two or three days the newspapers received printed orders indicating what they were forbidden to publish, the attitude they were to assume on particular topics, and the articles from other papers they were free to reproduce. Editors were usually allowed to produce their papers without a preliminary examination of the proofs, but transgression of the regulations was followed by prosecution or suspension. One form of punishment was to place a paper on "preventive censorship," under which all proofs had to be submitted, and any matter could be struck out, without, however, removing responsibility for what remained. The *Norddeutsche Allgemeine Zeitung* was a purely official organ, and several other papers, notably the *Kölnische Zeitung* and the *Berliner Lokal-Anzeiger*, were semi-official.

With regard to the Press generally, there were several agencies of direction and inspiration. The Press Department of the Foreign Office issued a regular news-sheet containing the statements and views the propagation of which was desired; it also acted directly on newspaper correspondents. The Admiralty had a very active publicity department, for some time under the direction of Mathias Erzberger and Paul Rohrbach. The Ministry of the Interior had a separate organization and also circulated "tendencious" sheets. The War Press Bureau, controlled by the Higher Command, was the most important propagandist organ. It issued commands to the censorship, laying down the prohibitions and the special attitudes which were circulated through the local authorities, and it had a special foreign section. Moreover, daily Press séances were held by three officials, representing respectively the Foreign Office, the War Office and the Admiralty, at which instructions and directions too delicate to be committed to paper were issued.

German propaganda in neutral countries was officially controlled by a branch of the Foreign Office, the *Zentralstelle für Auslandsdienst*. It issued material for propaganda and propaganda for distribution through the official representatives in foreign countries. Every Germany embassy or legation had at least one organ under its immediate control, sometimes published in German specially for German readers, more often in the language of the country in which it was issued. The material consisted of copies of a special newspaper, the *Nachrichten der Auslandspresse*, prepared by the War Press Bureau, a daily paper containing telegrams and notes on current events, and often selected news cuttings issued by the general staff. Another official agency, believed to be directed by the Admiralty, issued an attractive and well-illustrated periodical, the *Kriegs Kronik*, as well as the *Kriegs Nachrichten*, the latter consisting of prepared articles on war subjects and a "Berlin" letter, for the edification of the foreign Press.

In addition there were several highly important private organizations for foreign propaganda. The *Deutscher Ueberseesendienst Transocean* was a syndicate established before the war by big German industrialists to supplement and correct the service of the official Wolff Bureau. It issued the daily German wireless, had a special foreign news-service consisting chiefly of selected cuttings from German and foreign newspapers, and a very fine illustrated monthly periodical in five languages—*Der Grosse Krieg in Bildern*. It had an intelligence division which reported on the standing and personality of newspaper editors in every country, and suggested means of influencing them. The *Kriegs-ausschuss der deutschen Industrie*, formed originally to represent industrialists in their controversies with the Government, became an extensive propagandist chiefly on trade matters. A bureau at Frankfurt-on-Main, partly official, dealt chiefly

with Latin countries. The *Deutsch-Südamerikanisches Institut*, and the *Hamburgischer Ibero-Amerikanischer Verein* were occupied chiefly with Latin and Latin-American countries, and had agents and usually press organs in every country where Spanish or Portuguese is spoken. The Far East was served through the *Ostasiatische-Lloyd*, which supplied a distributing centre in Shanghai.

Until the United States of America came into the war, there was a very active German campaign to influence American opinion in favour of Germany. A great part of it was conducted from the German embassy in Washington, and through the German consuls throughout the United States. Much work was done by special missions such as that of Dr. Dernburg, a former Colonial Secretary, and every German bank or trading corporation was a centre of organized effort. A very large number of serious books by well-known German authors were translated into English for American readers. These followed certain main lines. They drew contrasts between the peaceful progress of Germany since her unification, as compared with the violence of other Powers. They represented Germany as being engaged purely in self-defence. They offered veiled threats or bribes to the United States with reference to Japan. They insisted on the moral basis of German culture and civilization. Closely similar lines were followed by many leading Americans of German descent. Perhaps the most effective of these American-Germans was Hugo Münsterberg, professor of psychology at Harvard, who advocated the cause of his natal country with eloquence and apparent moderation. His main point was that the war was really a struggle between Russian barbarism and the western culture of Germany, France taking sides because of Alsace-Lorraine, England because of her commercial rivalry and desire for German colonies. If Germany were beaten, it would be a triumph of Asiatic Russia and of Japan over the culture of Europe and America. It was suggested that the task of America was to give Europe an honourable peace, which she could do only by the strictest neutrality, with a leaning to Germany. Some true Americans also engaged in propaganda in favour of Germany. Some of these, doubtless, were mere hirelings; the better were chiefly persons of standing in the literary, scientific and musical world, who had been much in Germany. Some of the exchange professors were leaders in this work, and very naturally advocated with zeal and knowledge the best side of the German character and the great part Germany had played in the arts and sciences. Still more vocal were the Irish-Americans, who devoted themselves with a malignant bitterness to propaganda against England.

As regards direct German propaganda against the enemy, comparatively little was done, as compared with other combatants, in the distribution of propagandist literature from Germany amongst the actual troops opposed to her. The *Gazette des Ardennes* was the most successful effort. It was a regular newspaper, written in French and often with an illustrated supplement. It was sent into France by balloons, and occasionally by aeroplane, and sometimes gained entrance through a neutral country. It was eagerly sought, as it was baited with genuine information as to French prisoners. Otherwise it consisted of well-arranged propagandist matter of the usual type. The *Continental Times*, written in English, was founded before the war as a genuine newspaper for Americans travelling in Germany and Austria. During the war, probably with the aid of a German subsidy, it developed into a propagandist organ, chiefly anti-English, and almost ludicrous in its exaggerated malevolence. It was freely circulated among English prisoners in German camps, where, fortunately, it was the occasion of a good deal of amusement. The *Russkhiya Izvestia*, written in Russian, was distributed to Russian prisoners of war, and to a smaller extent in Russia. It was a competent piece of work, addressed to the task of persuading the Russian peasant that his two chief enemies were England and his own Government, and that the victory of Germany would mean liberation.

Germany's greatest propagandist effort against her enemies was carried out by indirect means. Wherever she thought that

there was opportunity, she endeavoured to excite the discontented subjects of her enemies. She sought to get in touch with Irishmen, Indians, Arabs, Egyptians, Boers, Algerians and Georgians, and with various black races. A special organization or committee in Berlin attended to each of these peoples, and to many others. Where possible, representatives were lured to Berlin, and, if thought useful, were provided with funds. Missions, sometimes accompanied by Germans, were sent wherever they could be sent with safety. On the negative side the effort had some success, and existing discontent was sedulously fomented. But on the positive side there was little gain, for the Germans were seldom able to persuade the actual or tentative rebels that their future position would be any better under the domination of Germany. (P. C. M.)

**PROPELLANTS** (see 10.83).—A propellant explosive should burn comparatively slowly, and thus allow the use of a suitable charge for the required muzzle velocity without causing a high chamber pressure, and enable the maximum pressure to be kept low while better sustained; it should burn regularly—which depends upon the area of surface exposed to burning—and the rate should be easily capable of regulation; it should be smokeless, without bright flash; it should not give excessive heat during combustion, but be easy of ignition and not leave any solid residue; it should have both chemical and ballistic stability while in storage. The method of manufacture and the proportionate mixture of cordite, the British smokeless propellant (see 7.138), have been very largely controlled by the postulated requirements, particularly as regards keeping qualities.

With cordite manufactured by the methods in vogue before the World War the nitrocellulose used was highly nitrated, necessitating the use of acetone as a solvent. This involved a serious disadvantage in that the supply of the solvent materially governed the output of cordite. The enormous amounts of propellant required and the demand for rapid supply during the war made this disadvantage seriously felt, and thoughts were turned in the direction of discovering some expedients in which a state of lower nitration would render possible the use of some other solvent, which could be more easily obtained, as well as the devising of new methods by which the time expended in manufacture might be materially reduced. At the same time it was postulated that disturbance of the ballistic and heat value of cordite M.D. was not to be incurred.

Experiments resulted in the introduction of a class of cordite known as R.D.B. (Research Department, mixture B.), with which ether-alcohol is used as the solvent. It consists in a percentage composition of nitroglycerine (42%), nitro-cotton (52%), mineral jelly (6%). A larger percentage of nitroglycerine was included in this mixture in order to compensate for the lower nature of nitrocellulose, and a higher proportion of mineral jelly to reduce the higher temperature produced by the extra proportion of nitroglycerine. The appearance of this class of cordite, as compared with cordite M.D., is not so clear, generally warped, with a rougher surface. With this mixture, not only was there the advantage in employing a solvent, of which supply was assured, but also the time required for drying in manufacture was considerably reduced.

Originally, the tubular form was introduced for cordite in order to maintain an equal area of burning surface, and so permit a more equally sustained pressure during combustion. In the form of strips, cordite gives very similar action as in the form of tubes; this form in manufacture and otherwise has other advantages which favoured its use for cartridges. But since, when made up into charges, strip cordite is apt to become packed tight, and so practically form a solid bundle, the result on explosion may not be as desired.

The provision of cellulose for conversion into nitrocellulose depended during the war very largely on the obtainable supplies. In Germany different expedients were tried, amongst them an unsuccessful attempt to use an artificial silk made by dissolving wood-cellulose in suitable solvents. But practically all the nitrocellulose made in that country, during the war, was made from a certain kind of paper, probably from some form of wood-cellulose (see CELLULOSE).

The American service propellant N.C.T. (nitrocellulose tubular) is a soluble nitro-cotton powder gelatinized by ether-alcohol, and containing a small percentage of diphenylamine added to act as a stabilizer. The powder is practically a pure nitrocellulose powder, and consists of nitrocellulose (97%), stabilizer (0.5%), volatile matter (2.5%).

The nitration of the cellulose is similar to the process in the case of cordite, but the drying of the powder is not carried so far, a con-

siderable proportion of the solvent being retained. The stabilizer, being a substance with an affinity for nitrogen dioxide ( $\text{NO}_2$ ), is intended to prevent the free presence of nitrous acid should any decomposition occur. It is claimed for the stabilizer that it at the same time acts as a detector and shows when decomposition is occurring, by means of the resulting discoloration; but this claim does not appear to have been clearly established. The shape of the powder is different from that of cordite. The mixture is extruded through dies, for charges for smaller guns in a tubular form, and for larger guns as a stick with several longitudinal holes; as it is extruded, it is cut into short lengths, the lengths having a proportionate relation to the diameter of the hole in the stick. This shape enables greater ease in making up cartridges than with cordite, requiring merely the weighing of the charge on scales as against cutting lengths of cordite according to size and weight. Nitrocellulose tubular is not so powerful as cordite, and therefore larger charges are required; it is hygroscopic, and consequently, if cartridges become damp, considerable variations in ballistics may result; it is not so stable in storage as cordite. On the other hand, it is more uniform in burning (at a slower rate and with a lower temperature than cordite), and so causes much less erosion in a gun; and, further, the loading temperature has less effect on ballistics than with cordite, and the regularity in worn guns is better. The colour of the grains varies very much and may be buff, brown, dark blue or even nearly black, perhaps owing to slight changes in the stabilizer present; but practically no difference in stability has been detected, except when the colour becomes brick-red, or rusty, when it may be concluded that corrosion has set in.

A flameless powder has been made in America for which it is claimed that, with field guns firing this kind of powder, it is possible for the eyes of the gunner to see the muzzle of the gun at the moment of firing, and that the flash is imperceptible at a distance of a mile. The composition of the American powder is approximately 60% of nitro-cotton, stabilized only with potassium carbonate, 25-28% of nitroglycerine treated in the same way, 5-7% of diphenylphthalic diethylester of the phthalic acid obtained by esterifying phthalic anhydride with ethyl-alcohol in the presence of sodium bisulphate and 3-5% of neutral potassium tartrate, vaseline or mineral jelly up to 5% is used to balance the composition. The dimensions of the powder-sticks and the exact composition depend upon the form to be used and have to be calculated.

The German propellant used with the 77-mm. gun was in the form of tubular sticks, and was a ballistite containing a stabilizer of "centralite" type, the stabilizer being the thio-urea derivative corresponding to diphenyldimethyl-urea. This last substance has been found frequently in German powders; it is very resistant to the action of acids and alkalis and is oxidized by fuming nitric acid only after prolonged heating at a high temperature.

A ballistite containing 60% of nitrocellulose and 38% of nitroglycerine has been used by the Germans; and also a mixture of nitrocellulose (66-16%), nitroglycerine (25-97%), sym. diethyl-diphenyl-urea (5-64%), volatile matter (0-91%), mineral matter (1-32%). With certain guns the Germans tried a mixture of ammonium nitrate (84-5%), carbon (15-0%), ammonium chloride (0-5%), in a compressed block, in the shape of an annulus, which was inserted in the cartridge-case above a charge of ordinary nitrocellulose powder. What was the exact result of this combination is not clear.

Among sporting powders which were tried during the war as propellants might be quoted as an example E.C.3—a powder made by a private company—which was used rather largely in trench warfare. This also is a nitrocellulose powder, which after forming to required shape is treated with acetone so that the outer surface is hardened. It is claimed for this process that the pressure during burning is more evenly distributed and more regularly maintained, since the hardened skin of the powder allows of slow burning to commence with and the porous interior allows more rapid action later on. (F. M. R.)

**PROTHERO, SIR GEORGE WALTER** (1848- ), English man of letters, was born in Wilts. Oct. 14 1848. Educated at Eton, King's College, Cambridge, and the university of Bonn, he became fellow of King's College, Cambridge, and was history lecturer there from 1876 to 1894, when he became professor of history at the university of Edinburgh 1894-9. He was a member of the Royal Commission for Ecclesiastical Discipline 1904-6. In 1899 he succeeded his brother Rowland (afterwards Lord Ernle) as editor of the *Quarterly Review*. He was also editor of the Cambridge Historical Series and co-editor of the *Cambridge Modern History*. During the World War he was head of the historical section of the British Foreign Office, and in that capacity attended the Peace Conference in Paris (1919). He was created K.B.E. in 1920. Amongst his publications are *Life and Times of Simon de Montfort* (1877), *Memoir of Henry Bradshaw* (1880), and various volumes of historical papers, as well as the *British History Reader* (1898).

**PROTOPOPOV, ALEXANDER DMITRIEVICH** (1864-1918), Russian statesman, was born in 1864 and educated in a military school. He served for some time in the army, but he soon left the service and went into business. As a big landowner of the Simbirsk province he took an active part in the Zemstvo life and was elected member of the executive board of the Simbirsk Zemstvo and marshal of the nobility of the Simbirsk province. In 1907 he was elected member of the third and subsequently of the fourth State Duma, where he joined the left wing of the Octobrist (Moderate Liberal) party. Later he became vice-president of the State Duma. The first unfavourable rumours with reference to him arose in connexion with an interview with Herr Max Warburg, the German financier at Stockholm. In March 1916 he visited the capitals of western Europe as one of the leaders of the Russian parliamentary delegation. On his return journey he privately met at Stockholm Herr Warburg, the head of the Scandinavian section of the German Committee on Food Supplies. The importance of the conversation was, however, greatly exaggerated by the press, and also by Protopopov himself. At the beginning of Oct. 1916 Protopopov was appointed, through the influence of the Emperor, Minister of the Interior, in succession to Khvostov, and thus entered the Sturmer Cabinet. A former leader of Liberals, he proved to be now the strongest upholder of reaction. He enforced the censorship with unexampled rigour, and his interference with the food-supply work of the Zemstvos and Towns Union created a serious danger to the activities of these organizations. At a stormy meeting held at the Duma he was asked by his political friends to resign his post, and when he refused to do so they struck his name off the list of members of the party. Hated by the Liberal circles and the Duma, Protopopov not only supported the reactionary policy of Sturmer and Prince Galitzin with the utmost energy, but he is said also to have been one of the secret organizers of the disturbances of Feb. 1917, which he proposed to suppress by military force, and which, unexpectedly for him, resulted in the overthrow of the Empire and of himself. He was arrested by the Provisional Government and committed for trial. He remained for many months in the Peter and Paul fortress and was executed by order of the Extraordinary Commission in Sept. 1918.

**PROTOZOOLOGY** (see 22.479) is that branch of zoology which is concerned with the group of animals known as the Protozoa. It is not, as its name might seem to imply, a primitive form of zoology. As a science it is comparatively young, but, owing chiefly to the practical importance of some of the animals with which it deals, it had in 1921 already become one of the largest and most cultivated fields in biology. The Protozoa are very interesting animals, from both the practical and the theoretical standpoint. Nevertheless, they are all small, and most of them of microscopic dimensions. To the general public they are therefore invisible, and consequently unknown, except by the conspicuous results—such as diseases—which they occasionally produce. In common speech they are still nameless, though they are popularly included among "animalcules" and "microbes." But these are unscientific and unnatural groups, which comprise all microscopic creatures, both animals and plants; and consequently the Protozoa are still confused, in the popular mind, with other "microbes," such as the Bacteria, with which they have no connexion.

It will be evident that protozoology, as an independent science, must necessarily have arisen as a comparatively late offshoot of zoology. Its history is bound up with that of the microscope, an instrument which bears much the same relation to protozoology that the telescope does to astronomy. Before microscopes were invented no Protozoa could have been clearly visible. With the first lenses, the largest and most conspicuous of them were discovered; and as microscopes were improved, more and more minute creatures gradually became known. Out of the confusion of forms which the microscope has continued to reveal, the Protozoa have ultimately emerged as a well-defined group of animals, and, as a result, those who study these animals have slowly built up a new section of zoological science.

As an individual science protozoology only became self-conscious at a quite recent period. The name itself, though already in use between 1870 and 1880, only became current after the opening of the 20th century—that is to say, within the memory of many living zoologists. But the science was really born—though not baptized—when the first Protozoa were discovered. This far-reaching discovery was made in the latter half of the 17th century. It was made by a man who was neither zoologist nor physician, but who occupied the humble position of chamberlain to the sheriffs of the little town of Delft, in Holland—Antony van Leeuwenhoek (1632–1723), an amateur microscopist, who studied at no university, nor under any of the great professors of his day, but whose title to fame rests upon the simple and honest application of his own native genius. This remarkable man made his own microscopes, lenses and all, and turned them upon almost every object which suggested itself to his quick imagination. In the course of his work he examined the water from the leaden gutters of his house, from the well in his courtyard, and also fresh rain-water, snow-water and “the water wherein pepper had lain infused.” He found that all these liquids, and many others, were not clear and empty when viewed by the microscope, but teeming with living creatures. The discovery was promptly communicated by letter to the Royal Society in London, who published a part of it in the year 1677. Some of the animals which Leeuwenhoek here described can now be identified as Protozoa, and his letter may therefore be regarded as the first page in the history of protozoology.

Leeuwenhoek, the father of protozoology, himself studied and described many Protozoa. His observations were soon repeated and confirmed by others, notably by some of the early Fellows of the Royal Society and his fellow-countryman Huygens, the great astronomer. But for many years protozoology made little progress, and remained essentially what it was originally, an amusement rather than a science. Although many good observations were made and recorded, they were always disjointed, and often distorted by fancy and speculation. Many good zoologists regarded with doubt and misgiving everything seen with the microscope, an attitude of mind which has not quite disappeared even in these days of perfect instruments. Even the great Linnaeus (1707–1778), who attempted to catalogue and classify all animals and plants, and thereby founded modern systematic biology, never really overcame his suspicions sufficiently to incorporate the Protozoa firmly in his system. His mental attitude is shown in the name “*Chaos infusorium*,” with which, in 1767, he dubbed a mixed lot of questionable protozoal organisms—the term *Chaos* itself having been suggested, no doubt, by Ovid’s “*rudis indigestaque moles*.”

But already at this period many workers were convinced that the Protozoa—or “*Infusoria*,” as they were then called, from their occurrence in infusions—have a real existence. The once notorious John Hill (1716–1775), in the course of his journalistic, theatrical, medical, and botanical adventures, turned his attention to microscopes; and in 1752 he described and, for the first time, scientifically named, a number of Protozoa which he had seen in infusions. Up to this time writers had been content to call them by diminutives of the names of larger and more familiar creatures, or occasionally by names suggested by comparison with some common object. We thus find the early protozoologists describing their observations upon “*little insects*,” “*worms*,” “*fishes*,” and even “*reptiles*,” and upon “*the slipper*,” “*the sun*,” “*the trumpet*,” “*the gimlet*,” or “*the bell animalcule*.” It was not until 1773 that a serious attempt was made to reduce the chaos to order by careful observation and description and classification of the “*Infusoria*.” This notable work was done by the Danish naturalist, O. F. Müller (1730–1784); and his last book, published posthumously in 1786, is the first systematic treatise on protozoology. It is a remarkable work, full of shrewd observations, and showing astonishing insight, but containing, of course, many mistakes which were inevitable at that period. Many of the Protozoa described and sketched by Müller—mostly from observations made, as were those of Leeuwenhoek, with the aid of only a simple lens—are easily recognizable now by a protozoologist.

The circumstance that Müller was able to attempt a comprehensive systematic treatise on the Protozoa implies that a very considerable advance had taken place in biological thought since microscopic organisms were discovered. Many of the earlier workers, like the uneducated at the present day, believed in spontaneous generation. They believed, with Aristotle, that many “*imperfect*” animals were bred in mud, water, or decomposing matter; and so long as this view was tenable there was no reason why these misbegotten offspring of the superabundant vitality of the earth should display any particular constancy in their appearance or any fixity of form. Consequently, to attempt to describe and classify the “*Infusoria*” must have seemed a futile task to many men of science two hundred years ago.

Spontaneous generation, as a scientific doctrine, was not really demolished by the admirable experiments of Redi (1668), as is often supposed, for he disproved it for only the larger and more obvious animals, such as insects; and the later discovery of microscopic organisms raised the whole problem once more, but presented it in a much more difficult form. It was Redi’s countryman, Spallanzani, who, a hundred years later, extended his observations to microscopic animals, and showed by means of ingenious and exact experiments that the “*Infusoria*” spring from living antecedents, and live, grow, and multiply like larger creatures. Spallanzani helped to lay the foundations on which Müller built, though his own work was not firmly consolidated until, a century later, the last rivets were driven in by Pasteur and Tyndall.

In the latter half of the 18th century many minor contributions were made to protozoology, and although these were continued during the early part of the next century, no considerable advance was made until about 1830, when the Berlin zoologist, C. G. Ehrenberg (1795–1876), began to publish his researches. With amazing perseverance he studied, described, and named all the “*Infusoria*” that he could find; and as he pursued his investigations not only at home, but also in Egypt, Arabia, Siberia, and elsewhere, the forms which he discovered were not a few. His chief contribution to protozoology was published in 1838—a monumental folio volume of more than 550 pages, accompanied by an atlas of 64 coloured plates. This is still one of the classics of the science. It contained much that was new and much that was true, everything of note that his industrious reading could find in the works of his predecessors, and withal a mass of mistakes, to which he clung tenaciously—in spite of violent contradiction and criticism—to the end of his days.

Ehrenberg’s most dangerous opponent was a Frenchman, Félix Dujardin (1801–1860). In 1841, with an octavo volume of some 680 pages, but only 23 plates, he undermined the foundations of the big folio, and thus overthrew, for all time, many of the favourite theories of his German antagonist. Dujardin’s work is also a protozoological classic. Together with Ehrenberg’s volume it marks the end of the old protozoology of the micrographers and the beginning of the new science as a special branch of zoology. Rarely does the modern worker, unless he be a historian, require to consult any earlier treatises than these.

Since the time of Dujardin only one really exhaustive work on the Protozoa as a whole has been written. This is the great monograph by O. Bütschli, of Heidelberg, published in 1880–9. It is significant of the vast modern development of protozoology that up to 1921 no work on a like scale, by a single individual, had been produced. It is now, indeed, impossible for any one man even to read all that has been written on the Protozoa, and the more recent workers have had perforce to devote their attention to some particular group of these organisms, or to some special branch of protozoology. To master a detail of the science is now the work of a lifetime. No one man could in 1921 claim to be an expert in all protozoology any more than in all mathematics or all chemistry. The territory already surveyed was so vast that the most he could hope to do was to cultivate his own small holding properly.

*The Modern Science.*—Since the middle of the 19th century biological theory and practice have undergone profound changes; and in more recent years protozoology, with the rest of zoology, has largely changed its character. This period has seen—to note but a few of its more striking developments—the establishment of the Theory of Organic Evolution, the rise of the Cell Theory, the foundation of Histology and Cytology, and the unfolding of Physiology and Embryology and Medicine as experimental sciences. Protozoology has been profoundly influenced by all these new growths, and has itself contributed not a little to them. An attempt has been made, and has already been partly successful, first, to discover all the Protozoa there are, both living and fossil; then to investigate their structure in the minutest detail, and to ascertain how they live and develop; and finally, to understand their relations to other organisms and their place in nature. Countless monographs have been written on individual species, on the larger and smaller groups into which these can be scientifically classified, on collections made all over the world, and upon the special physiological, medical, and other problems which the Protozoa, as a whole or in part, present. But we must content ourselves here with the merest sketch of the growth and status of modern protozoology.

Before proceeding, we must note some of the peculiar difficulties which differentiate protozoology from the rest of zoology. The animals with which it deals are, speaking generally, invisible to the naked eye. Consequently, they cannot be studied and anatomized by ordinary methods. The protozoologist has first to become a master in the use of the microscope, and to learn its limitations as an instrument of research. When he

has become proficient he must learn or devise methods for catching, watching, breeding and preserving those Protozoa that he wishes to study, and must thus become familiar with a peculiar and varied technique adapted to the investigation of the lives and habits of animals invisible to the unaided eye. He must then acquire the power of correctly interpreting what he sees under these peculiar conditions. If he is an efficient microscopist and a good observer, endowed with abundant patience and ingenuity, and if, at the same time, he is a good zoologist and sound philosopher, then, with experience and diligence, he may hope some day to become a good protozoologist. From the very nature of the subject, therefore, it will be obvious that it is easier to make mistakes in protozoology than in most other branches of zoology; and there can be little doubt that the writings on the Protozoa, taken as a whole, contain a larger percentage of error than those on any other group of animals. Protozoology is, indeed, still in its infancy, and learning slowly and painfully by the method of making mistakes.

Protozoology, like most other sciences, is important from two different standpoints, which may be called the theoretical and the practical. On the theoretical side we have to consider its relations to the rest of zoology, and the value of its contributions to biological philosophy; on the other side, we must consider the utility of its practical applications, which are chiefly medical. In other words, we must look at protozoology as a pure science and as an applied science. It is necessary to distinguish these two aspects, although they are inextricably blended in reality. Protozoology was actually applied in medicine before it was ready; and this led not only to great confusion but almost to the severance of Medical Protozoology from the rest of the science. But progress on the medical side has now reacted beneficially upon the pure science, by bringing to light many new facts and setting many new problems.

*The Pure Science.*—The theoretical importance of protozoology is not what it appeared to be fifty years ago. It has not fulfilled some of the high hopes then entertained for its future. In the earlier period the writer of an article such as this would have begun, in all probability, by declaring that the study of the Protozoa would lead to the solution of most of the outstanding general problems of biology. He would have pointed out that these animals were of the greatest importance in connexion with the two chief biological generalizations of his time—the Cell Theory and the Evolution Theory—and he would probably have ended by saying that it was only lack of detailed knowledge which prevented protozoology from answering most of the fundamental questions of biology. Yet we have now an abundance of the sort of information then regarded as requisite, and the great problems are still, for the most part, where they were. It is both interesting and instructive to inquire how this has come about.

The cell theory was first definitely formulated, in Germany, by Schleiden (1838) and Schwann (1839), and was modelled into its modern form by Max Schultze (1861): that is to say, it took shape at the time of the reformation of protozoology by Ehrenberg and Dujardin, when the science was still feeling for a foothold. According to the cell doctrine, all organisms, both animals and plants, are built up of structural units, called "cells," in much the same way as a house is built of bricks. Schultze defined "a cell" as "a little lump of protoplasm with a nucleus inside it," and this definition was generally accepted. It should be noted that this proposition, so far as the larger animals and plants are concerned, is not a "theory" at all, but a statement of fact easily verifiable by means of the microscope. The body of a rabbit or a cabbage is, for the most part, actually composed of "cells" as conceived in the definition. The "theory" was introduced when the proposition was held to apply to all organisms at all stages in their development. Dujardin had shown that the Protozoa are soft-bodied animals composed of "sarcode"—the "protoplasm" of later workers—in which no constituent "cells" are discernible. Like "cells" Protozoa contain "nuclei," but, unlike the large animals, they show no internal differentiation into cellular units. It was thus

necessary to introduce some new conception if the cell theory was to become universally applicable.

The extension of the theory, so as to enable it to include the Protozoa, was made by von Siebold. Each individual protozoon, he said, is itself a "cell." It is comparable with a single one of the innumerable units of which the bodies of large animals are built. The Protozoa are "unicellular" animals, all others "multicellular." According to this doctrine, therefore, a protozoon is not comparable, as an individual, with a whole multicellular animal, but with one of the cells in its body; or, the other way about, a multicellular animal is not an individual of the same sort as a protozoon, but a colony of such individuals.

This conception appeared so plausible—owing, it must be supposed, to the backward state of protozoology and cytology at that date—that it found ready acceptance; and, in spite of the cogent objections which have been raised against it by Huxley (1853), Whitman (1893), Sedgwick (1894), Dobell (1911), and others, it has prevailed down to the present day. The cell theory is still taught to almost every beginner in biology. He is still told that he is not an individual, but a community of individuals; and that the protozoon, which he can see with his own eyes leading an individual existence, is not an individual—such as he believed himself to be—but the equivalent of one little bit of his body.

When the cell theory was being founded, another great biological generalization was just emerging—the doctrine of Organic Evolution. Charles Darwin's great work, which appeared in 1859, created a revolution in biological thinking. Although Darwin's own work, and his statement of the theory, appear to be unexceptionable, the doctrine misnamed "Darwinism" developed along extravagant lines—chiefly, as is now evident, owing to the wild speculations and dominating influence of E. Haeckel and other German writers. The "cell theory" was immediately subpoenaed to give evidence for these "Darwinists." They wrongly believed that the evolution theory required the presence of some "most primitive" and "elementary" animals—from which all the "higher" forms had been derived—on the earth at the present day; and the shaky syllables let fall by the cell theory were eagerly seized upon, interpreted, and ultimately incorporated as incontrovertible facts in the case of the "Evolutionists." "Unicellular" organisms—such as the Protozoa—thus became the starting-point of evolutionary speculations. The Protozoa were obviously the "simplest" animals, since less was known about them than about the others; and they were clearly the "most elementary," each individual representing but one of the structural elements of which the others were composed. Their insignificant size made them the "lowest" forms on earth, and their position—according to the "theory"—at the bottom of the *Scala Naturae*, made them the "most primitive." It thus became easy to show, by specious arguments and "question-begging epithets," that protozoology occupied a position of fundamental importance in biology. By studying the Protozoa the earliest stages in evolution would be revealed. The beginnings of life would be laid bare. Physiology and morphology would appear in their elemental forms, stripped of all confusing detail. And optimists were not wanting who divined that, by higher and still higher powers of the microscope, Nature's inmost secrets—such as the origin of life itself—would be divulged.

These fantastic dreams have been slowly dispelled by the "dry light" of reason. It has become clear that protozoology was placed in a false position by the devotees of the cell doctrine and the dogmatic evolutionists. Let us look at the fundamental conception of the "unicellularity" of the Protozoa from another angle, and see how it appears in the light of modern knowledge.

In the first place, it is clear that the Protozoa cannot properly be described as "unicellular." Every protozoal animal has an independent existence. It has its own peculiar structure, exercises its own proper functions, leads its own life—often, indeed, a very complex one. As an animal it is, from every standpoint, as much an "individual" as a man is. One protozoon is one whole animal, just as one man is one whole animal. From the

standpoint of common sense, no less than from that of modern zoology, the whole organism is the unit of individuality. But when we examine a protozoon under the microscope we still see—as Dujardin saw—that its body is not differentiated internally into cells, as is that of a man. Its body is often surprisingly complex in structure, but it is never composed of cells. It is clear, therefore, that we can contrast the body of a man with that of a protozoon by saying that the one is cellular in structure, the other *non-cellular*. To call it “unicellular,” and thus compare one whole animal with a minute differentiated fraction of another, is obviously absurd. It is as though a man who had only seen houses built of bricks were suddenly to encounter one constructed, all of a piece, of concrete; and then, being unable to find the familiar individual bricks in its fabric, were to declare that the concrete house is not a house—in the sense that the brick house is—but one large and peculiarly modified brick.

When once it is realized that the Protozoa are not, in any sense, “elementary” or “unicellular” animals, but a group of peculiarly constructed creatures, adapted in a special way to particular conditions of life, then it will also be realized that we have no reasons—apart from preconceived ideas derived from unsound generalizations—for believing that they represent “primitive” or “first” forms of life. That they are not “simple” we now know. It is true that they display, on the whole, less visible structural differentiation than most of the larger animals, but physiologically they are very complex. That they are able to perform all the chief functions of “higher” animals, but with fewer instruments, does not make their mechanism easier to understand; and it is thus hardly conceivable that the Protozoa can ever offer us the easiest way of approach to physiological problems. They offer us, indeed, the most difficult field in animal physiology, owing to their microscopic size and *apparent* simplicity of structure. As a great physiologist has well said: “Experience and reflection have shown me that, after all, the physiological world is wise in spending its strength on the study of the higher animals. And for the simple reason that in these, everything being so much more highly differentiated, the clews of the tangles come, so to speak, much more often to the surface, and may be picked up much more readily” (Michael Foster). Attempts to found a “general physiology” on the Protozoa as “cells” and “elements” are doomed to failure, for they are based upon an unsound philosophy; and the speculative and deductive efforts in this direction—such as that of Verworn in Germany—have slowly given way before the experimental and inductive methods of Jennings and others in America and elsewhere.

As a point of historic interest, it may be noted that the father of protozoology and his immediate followers had none of the extravagant later notions regarding the “unicellular” and “elementary” nature of the Protozoa. For Leeuwenhoek the Protozoa were animals like any other animals, but delightfully and marvellously little; and he thus saw more clearly and naturally than many of his later successors.

There are probably few biologists who now cherish any hopes of seeing the fundamental problems of biology solved by the study of the Protozoa, though the majority still speak and write in the optimistic language of last century. For these mental survivals there is a psychological basis, which seems worth noting before we go on to consider the true status and value of protozoology. There is a curious disposition, apparently inherent in the human mind, to suppose that by studying the most minute creatures we can come nearer to first principles. And it is the same with the study of the larger organisms. As the cytologist probes into the structure of an animal with higher and still higher powers of the microscope, he feels that he is gradually “getting to the bottom” of his problems. He feels that when his microscope has resolved the larger animals into their smallest component parts, and has revealed every detail of the smallest living thing, he will be face to face with fundamentals. It does not require much thought to realize that this is a fallacy. The deeper we delve, the more detail we discover. But it is all of the same sort: we add to the quantity and not to the quality of our

knowledge. With the highest possible magnification we shall obtain no information which is qualitatively or fundamentally different from that to be derived from the study of large organisms, and their gross anatomy, with the naked eye.

The mental bias just mentioned seems to be responsible for many popular—and not a few “scientific”—notions about the Protozoa. It appears, for example, to be at the back of the unreasonable but common belief that the Protozoa are “elementary” and “primitive” animals. Although few biologists now believe in spontaneous generation, yet many are able to believe that living things must have been spontaneously generated from lifeless matter in the past; and to those who hold this belief it still appears self-evident that the organisms so generated were microscopic. Consequently, these biologists feel that the Protozoa must, in some way, be nearer than other animals to “the beginnings of life,” and they find no difficulty in conceiving that the first animals were “Protozoa.” In the same way, when these same biologists come to consider evolution, and the relations of living animals to one another, they find in the Protozoa the easiest starting-point for their speculations. The Protozoa are “the simplest” animals, and the human mind works most readily from simple to complex conceptions. Consequently, evolution is pictured as necessarily moving in the same direction—the simply constructed creatures coming first, and the complex developing from them. But it is surely a poor philosophy which would constrain Nature to order her infinite events in that particular sequence in which thoughts happen to follow one another most easily in the mind of man.

What, then, it may be asked, is the theoretical interest or value of protozoology? Clearly it is this. Biological theory is sound in proportion to the truth of its generalizations. When all the facts are known about all animals and plants, we shall be able to make true general propositions about them. Before we know the facts our generalizations can be but partial and premature—more or less lucky guesses, based upon incomplete knowledge. All biological theory is at present in this condition and therefore the careful study of any animal or group of animals—such as the Protozoa—will, if it yields new facts for generalization, be valuable ultimately as a contribution to biology. At present we cannot hope to do much more than collect facts, by means of accurate observation and apposite experiment. When we have collected and critically analyzed them, we can sometimes make tentative generalizations of a lesser order. But the larger and truer generalizations will come later.

It may be said that if this is all that can be expected from protozoology, then it is no more important than any other branch of zoology: there is no reason why we should study the Protozoa rather than any other group of animals. All this is quite true and reasonable; but there is also a reason why protozoology is likely to yield results of particular interest. The Protozoa are a group of animals organized on a different principle from the rest. They are, as we have just seen, non-cellular animals with peculiar lives and habits. Structurally and functionally they differ, in many ways, from all other animals. Now all the chief biological generalizations—almost all general propositions relating to such phenomena as birth, growth, development, sex, reproduction, heredity, variation, and death—have been derived from observations made upon the larger multicellular animals. When general ideas were formulated on such subjects the Protozoa were practically left out of account. When the more important facts about the Protozoa are firmly established, we shall be able to recast many of our biological theorems in a more satisfactory form. The Protozoa offer us, in other words, a new world of animals for generalization, and a new standpoint from which to survey our old-world zoological knowledge. The discovery of the Protozoa was to zoology what the discovery of America was to geography. But we are still, in protozoology, in the 16th century. For our knowledge of the new world we must still depend upon travellers' tales, upon reports of things ill-observed and misunderstood, marvels and myths and mysteries. But some day we shall have accurate and faithful records, and then protozoology will come

into its own. As yet we are hardly on the threshold of the new biology; but for those who delight in the destruction of error and the advancement of true learning, the protozoological prospect is already full of hope.

*The Applied Science.*—The chief practical applications of protozoology are to medicine. Certain of the Protozoa live as parasites in the bodies of men and animals, and thereby cause diseases. Some of these are so important that they are widely known—for example, malaria and sleeping sickness—and the elucidation of such diseases is one of the most interesting and recent chapters in biology. Protozoology also has certain applications to agricultural science, because many Protozoa inhabit the soil, but their value is still doubtful.

The founder of protozoology was the first to find Protozoa inhabiting the living bodies of other and larger animals. In 1681 he described one such "animalcule" which was living in his own intestine. In 1683 he described and depicted others from the intestine of the frog. All these are recognizable, with fair certainty, at the present day. Leeuwenhoek did not suggest that these "parasites" were in any way concerned in the causation of disease, and it is probable, indeed, that the forms which he observed are not. But already at that date the "microbe" theory of disease-production was in existence, for it was guessed at long before any "microbes" were discovered; and consequently we find that, even in Leeuwenhoek's lifetime, the suggestion was put forward that his "little animals" might be the "causes" of certain disorders. We find, for example, an early fellow of the Royal Society remarking, in 1683, of a "murren" which had raged among the cattle in central Europe, and of which the cause was undiscovered: "I wish Mr. Leeuwenhoek had been present at some of the dissections of these infected Animals, I am persuaded He would have discovered some strange Insect or other in them." Mr. Leeuwenhoek's successors have, on many a like occasion, fulfilled the expectations of "the ingenious Fred. Slare, M.D., and F.R.S.," but his "strange insects" they now call "Protozoa" or "Bacteria."

From the time of Leeuwenhoek to the present day the parasitic Protozoa have been studied with increasing attention. Their relation to diseases has been gradually elucidated, though we are still very far from finality in our knowledge of this absorbingly interesting subject. The history of our knowledge is long, and the discoveries have followed devious ways—too devious and intricate to be more than touched upon here.

Our knowledge of protozoal diseases—diseases colloquially said to be "caused" by protozoal parasites—really begins as recently as the middle of the 19th century, when Louis Pasteur (1822-1895) began his researches on a disease of silkworms called *pébrine*. Applying to the investigation of this disease the genius which stamps his work on "microbes" generally, Pasteur first discovered its causes, and then deduced methods for its prevention. The "cause" he found to be a microscopic parasite, now called *Nosema bombycis* and classified among the Protozoa. Although Pasteur did not know that the parasite was a protozoon, his work on *pébrine* and other microbic diseases was of fundamental importance for protozoology, because it demonstrated the methods by which such diseases can be studied and elucidated. Pasteur's scientific principles were impeccable, and equalled only by his own practical applications of them. It is common knowledge that he founded modern bacteriology, but in so doing he also laid the foundations of medical protozoology. To the casual reader it may seem strange that the study of silkworms can have any bearing upon medicine, or could in any way contribute towards the alleviation of human suffering. But there was another practical result of Pasteur's work which everyone will immediately appreciate, since it can be expressed in pounds, shillings and pence. Before *pébrine* attacked the silkworms of France the silk industry yielded an annual revenue of 130,000,000 francs to the State. After the disease had raged for a dozen years the revenue had fallen to 8,000,000, and the industry was on the brink of ruin. To have discovered the causes of the disease, and to have devised, as a direct consequence, means for its control, and, as a further consequence of this, to

have rehabilitated the whole silk industry—these are practical results which everyone can understand. And one has but to remember that protozoal diseases may affect man himself and his larger domesticated animals—not merely silkworms—to realize the practical possibilities of protozoology.

Towards the close of the 19th century medical protozoology became linked up with another branch of zoology—entomology, the science which deals with insects. This connexion has nothing to do with the silkworms just mentioned, but arose through the discovery of the part played by certain other insects in the causation of protozoal diseases. The discoveries in this field began, once more, with the investigation of a disease of domesticated animals; but the pioneer was not, in this case, the Frenchman Pasteur, but the Scotsman David Bruce. His work is of such importance that we must notice it at this point.

*The Work of Bruce.*—Some parts of Africa are the home of certain large blood-sucking flies called "tsetse." The "Fly Country" is uninhabitable except for wild animals; and long before its full significance was understood, the fly itself was recognized as a serious obstacle to the opening-up of Central Africa. Livingstone, the greatest of all African explorers, was so impressed with the fly's importance in this connexion that he put a vignette of a tsetse on the title-page of his *Missionary Travels* (1st ed., 1857). Live stock taken into the "Fly Country" rapidly succumbs to a disease which is called "nagana" in Zululand, where Bruce's original investigations were made. The disease was also called "tsetse-fly disease," since it was believed by the European settlers to be caused by the bite of the fly. The natives believed, however, that it was "caused by the presence of large game, the wild animals in some way contaminating the grass or drinking-water."

Bruce began his work in Zululand—after an abortive attempt in 1894—in Sept. 1895 (the month of Pasteur's death). His full report on his researches is dated May 1896. In this almost incredibly short space of time he demonstrated that nagana is caused by a protozoal blood-parasite—since named *Trypanosoma brucei*, after its discoverer; that the parasite lives normally in the blood of big game, without harming them; and that it is conveyed from animal to animal by the tsetse. When the fly sucks the blood of an infected animal it becomes itself infected with the trypanosomes, which are subsequently re-inoculated into other animals by the fly when it sucks their blood. If these other animals are domestic stock, such as oxen or horses, they become infected with trypanosomes, contract nagana, and die. If they are wild game, such as antelopes, they also become infected, but develop no disease. In nature the trypanosome lives in the game and the flies alternately, the fly acting as an intermediary in the spread of infection from antelope to antelope. The big game—indigenous in the country—are habituated to and proof against the infection, domestic animals—foreigners, introduced by man—are not, and when infected usually die.

Bruce thus succeeded in extracting elements of truth from both the European and the native beliefs, and was able to combine them into a true theory of the causation of nagana. At the same time he threw a flood of light on many other protozoal diseases, and suggested all sorts of possibilities concerning their causation and prevention. He forged new links between protozoology and medicine and between entomology and protozoology. It is true there were other lights and other links before. Trypanosomes were known, and known to cause diseases, before Bruce went to Zululand. Timothy Lewis and Griffith Evans had observed similar parasites in India more than a decade earlier; and Theobald Smith and Kilborne, in America, had demonstrated in 1893 that the disease of cattle known as "Texas fever"—a disease also caused by a blood-inhabiting protozoal parasite—is transmitted from beast to beast by the agency of ticks. But Bruce's work was solid, complete, and demonstrative. By clean experiments and right reasoning he contributed more to science in a few months than hundreds who have followed up his work have since been able to contribute in many years. In work of this sort it is the quality, not the quantity, that counts. Later researches have but served to enhance the

magnitude and difficulty of the problem which confronted Bruce in 1895; and to find a just parallel to the masterly manner in which he solved it, we must go back to Pasteur. There is, indeed, the same simplicity, the same directness, the same insight in the work of both these men. Their works are enduring demonstrations of the method of science: they are a delight to read, and illustrate on every page the favourite maxim of Boerhaave: *Simplex sigillum veri*.

The following-up of Bruce's discoveries and the working-out of details and consequences have led to the accumulation of an immense amount of new knowledge—protozoological, entomological, and medical. We can do no more than mention it here. We must, however, notice one of the first-fruits of his labours—the application of his results to the study of human diseases. This application was made mainly by Bruce himself. A few years after he had done his great work on nagana he attacked the problem of sleeping sickness, a human disease which has depopulated large areas of Central Africa. Bruce and his collaborators were able to show that this disease is similar to nagana. It is likewise caused by a trypanosome, which is conveyed to man by the bite of a tsetse-fly, and which is capable of living in other animals. In this case the parasite had been previously seen by Forde and Dutton, and by Castellani. But its relation to human disease and the part played by the tsetse in its transmission were first clearly demonstrated through the work of Bruce.

*Malaria and Other Diseases.*—We must now notice another disease, which is known by name to all—malaria, “the scourge of the tropics.” This disease, as we now know, is also carried from man to man by the agency of a blood-sucking fly—in this case a mosquito, and it is also caused by a blood-inhabiting protozoal parasite, though it is one very different from that which causes nagana. Moreover, this parasite lives in men and mosquitoes only. After undergoing a peculiar development in the blood of a human being, it is sucked up with his blood by a mosquito when it feeds upon him. Provided that the mosquito is of the right sort, the parasites in the blood—if they are in the proper stage of development—undergo further remarkable changes in the mosquito's body. Thereafter the mosquito is able to infect other men with the parasites, which it injects into their blood in the process of sucking. And so the life of the parasite continues.

The foregoing is the briefest synopsis of a very complicated story, in which almost every event has been worked out in great detail. Hundreds have contributed to this work, though some of them can hardly be said to have coöperated in it. Indeed, such bitter fights have taken place among them that it has now become almost impossible to mention the names of some workers without offending others. The history of these discoveries would give an unpleasant shock to anybody simple enough to believe that men of science always labour for truth and the advancement of knowledge rather than for fame and personal gain. Fortunately the names of the leading discoverers are now known to almost everybody, and their individual achievements are no longer in dispute. Even the “general reader” is familiar with the name of Laveran, the great Frenchman who, in 1880, discovered the malarial parasites in human blood; of Patrick Manson, the founder of modern tropical medicine, who divined, in 1894, the part played by the mosquito; of Ronald Ross, who, inspired by Manson, first worked out in 1898 the complete development of the malarial parasite of birds, and thus solved the general problem; and of Grassi and his fellow-workers in Italy, who immediately confirmed Ross's work and extended and successfully applied his results to the study of malaria in man. When the 19th century ended the story was almost complete.

It will be evident that malaria, nagana, and similar diseases are not purely protozoological problems. It will also be obvious that such diseases might be stamped out and prevented by attacking either the protozoal parasites which “cause” them, or the insects which transmit them, though there could have been but little hope of success in coping with such diseases before the life-histories of the parasites were discovered. When

protozoology, entomology and medicine have solved their respective parts of such problems, then many tropical regions which are now forbidden ground will become habitable for man and beast. The practical importance of protozoology in cases such as these is self-evident. The facts speak for themselves.

Malaria is a far commoner disease than nagana, and the discoveries relating to it have therefore made a far wider appeal to the public. It intrigues the public to hear that there would still be no Panama Canal but for the great discoveries in connexion with malaria. It would excite them but little to hear that some obscure tribe of Zulus could now keep cattle in places where it was previously impossible. But the advancement of science is not measured in such terms, and science values most highly those who discover and enunciate new principles. Already we can observe that the problems presented by nagana and malaria are similar, and that most of the generalizations which their solution can give us are, indeed, the same. We can see, too, that history, in the end, is generally just. Consequently, we may hazard a guess that in years to come the historian of science, in his impartial search for beginnings and great names, will not fail to note the sequence of the discoveries which we have just considered, and will apportion his praise accordingly.

*The World War Period.*—Medical protozoology, like many another branch of science, received a powerful stimulus from the World War of 1914-8. Not only was much of the previously acquired knowledge put into practice, but this practical application in turn revealed or emphasized the gaps, defects, and errors in many current conceptions, and so led ultimately to the prosecution of new researches and the acquisition of much new knowledge. Surveyed from the most general standpoint, the war appears to have taught us little that was new regarding malaria and the other protozoal diseases already mentioned. Its chief protozoological contribution has been to our knowledge of those Protozoa which live in the human intestine, and more especially to the elucidation of the disease called amoebic dysentery. We may therefore say a few words on this subject at this point.

The Protozoa known as “amoebae” form a large and interesting group. Most of the species live independently in such places as ponds, ditches, or the soil; but some of them live in the bodies of other animals, and one of them—called *Entamoeba histolytica*—was already known before the war to live in the human bowel and “cause” amoebic dysentery. The parasite was discovered by Lösch in Russia as long ago as 1875. Its real relation to dysentery, however, was not made clear, though much debated, until just before the war, when the admirable researches of two American workers in the Philippine Islands—E. L. Walker and A. W. Sellards—were published. During the war their results have been confirmed and greatly extended, chiefly by the investigations of British workers. As a consequence, we now know as much about amoebic dysentery as we do about malaria or the diseases due to trypanosomes. There are several points here which are worthy of mention.

We now know that no less than five different species of amoebae may live in the intestine of man, though only one of these—the “dysentery amoeba” already mentioned—ever does him any harm. Moreover, we now know also that amoebic dysentery is a comparatively rare disease. There are many different kinds of dysentery, and the kind due to amoebae is far from being the commonest. Before the war amoebic dysentery was generally recognized as a disease more or less restricted to the tropics, though certain other kinds of dysentery occur all over the world. The curious fact brought into prominence by the war is that the dysentery amoeba itself is very common almost everywhere. This parasite, which can cause, by its presence in the bowel, a violent and sometimes fatal form of dysentery, usually does no such thing. Very many people, in all parts of the world, are infected with it, but very few ever suffer any appreciable harm from its presence. The parasite and the person who harbours it are usually suited to one another in such a way that they can live together comfortably, oblivious of the existence of one another. There are, for instance, in the British Isles at this moment many thousands of people who are

heavily infected with these disease-producing parasites, and yet enjoying perfect health.

Another curious feature of amoebic dysentery is the circumstance that it cannot be contracted from a person suffering from the disease. The people responsible for the spread of infection are those who harbour the parasite but themselves suffer no ill-consequences from its presence. The explanation of these seemingly contradictory facts is really quite simple, now that we know the life-history of the amoeba and its relation to disease. It is a popular fallacy to suppose that any parasite is the sole "cause" of any disease. A disease is a joint result of many antecedent factors, and in the present case it would probably be nearer the truth to say that the person who harbours the amoeba, rather than the amoeba itself, is the "cause" of amoebic dysentery. For dysentery results only when the infected person happens to be abnormally sensitive to infection with the amoeba, and the condition is as harmful to the parasite as it is to the patient. Normally man and amoeba fit one another, and there is no trouble. Abnormally there is a misfit, and amoebic dysentery is the consequence. The disease is really an unimportant side-show in the life-history of the parasite, the result of its being planted in unsuitable soil.

The foregoing considerations will serve to show once more the value of protozoology in the study of human diseases. What hope could there ever be of eradicating a disease such as amoebic dysentery if we remained in ignorance of the life-history of the parasites connected with it? We might cure every case of the disease—we might conceivably prevent the death of every patient who contracted it; but even if we did, it is now clear that this would have no effect whatever upon the continuance and prevalence of the disease itself. Such procedure could not possibly stamp out amoebic dysentery, or even reduce by one the annual number of cases of this disorder. This is not to say that protozoology has yet enabled us to do either of these things; but it has enabled us to formulate the problem correctly, and has shown the uselessness of expending our energies in wrong directions. Greater results will follow when our knowledge is greater and more properly and consistently applied.

It has been supposed for so long that the parasites which produce protozoal diseases are peculiar to tropical or sub-tropical countries that the discovery of the dysentery amoeba in Britain may seem surprising. It is really not so surprising as the circumstance that nobody, until quite recently, had thought of looking for it here. And there are many equally remarkable parallels. To mention only those diseases and parasites which we have already noted, we can now say that malaria occurs indigenously in Britain—though this was hardly suspected until recently; and that parasites closely similar to those which cause nagana and Texas fever have now been discovered in the sheep and cattle of the United Kingdom. How far these observations are of practical importance the future will show, but already they clearly indicate that protozoology may be studied with profit at home no less than abroad.

*Organization and Training of Workers.*—In conclusion, we shall now note very briefly what has already been done for the promotion of protozoology as a branch of science.

As a profession it still hardly exists. Most of those who have enlarged the science have been zoologists or medical men engaged in teaching other subjects and in practising their professions. Many great discoveries have been made by men who cannot be described as protozoologists. But the science has now become so vast, from the amassing of myriads of complicated details, that it can no longer be regarded as an occupation for anyone but a highly trained specialist. The amateur toying with his microscope, the ordinary zoologist or physician working in occasional vacations or leisure hours snatched from practice, can no longer expect to make any solid contributions to protozoology. In future all great advances in knowledge must come from those who are bred up as protozoologists—who not only have the necessary physical and mental gifts for this most difficult study, but who also are prepared to devote their lives and energies to it, and to it alone.

Modern science has already developed to such unwieldy proportions that it has ceased to be coherent and has burst asunder into separate segments. The day of the "scientist," with all science for his province, is gone for ever. If men of science are to escape the fate of the builders of the Tower of Babel, it can only be by conscious coöperation. Each worker must do his own special work, but must do it with due regard for his fellow-labourers in adjoining sections, and with the plan of the whole building constantly before his eyes. Protozoology must, accordingly, develop along its own lines and by the labour of protozoologists, but it must remain in touch with the rest of zoology and with medicine and with all other sciences whose collaboration is likely to be mutually beneficial. We can already observe the bad effects of non-collaboration in the modern school of protozoology which originated with Fritz Schaudinn in Berlin. Over-specialization has there led—after beginning on an admirable foundation of fact—to fantastic speculation and the promulgation of doctrines which are biologically unsound.

One of the good results of the World War was to encourage the collaboration of workers in different branches of science, and in Britain the bonds which previously existed between protozoology and medicine have been greatly strengthened. One of the most obvious conditions necessary for the continuance of this alliance is the growth of protozoology itself. Unless the protozoologists can build solidly, and not too slowly, they will lose their advantages. Unfortunately, no adequate provision has yet been made for the training of workers in protozoology. At present there are in Britain and elsewhere few first-rate professional protozoologists and few competent teachers, but a large number of day labourers and dabblers from other sciences. Protozoologists are still mainly recruited from other professions. The remedy for this state of affairs will be found only when protozoology is recognized as a separate science—an occupation for specialists and not for smatterers; and when encouragement is given to its development by the founding of professorships in the subject—or similar appointments—in the larger universities. These professorships must be primarily for research, and secondarily for teaching purposes. The professor must have ample time and funds for teaching himself, and for carrying out his own researches. If he is sufficiently gifted to do both these things, he will be able at the same time to teach his science to others who would follow in his footsteps. But the time has now gone when the junior demonstrator in zoology or the lecturer on general parasitology in the medical schools can expect to "take up" protozoology for a term or two and thereby profit science or himself. Unfortunately, too little had been done up to 1921 to create the necessary facilities.

A professorship in the subject, founded on the right lines, was indeed instituted in London University some years ago, but it had remained unoccupied up to 1921 since the death of its first holder in 1915. At Cambridge the Quick professorship of biology, founded later, at one time appeared likely to develop into a chair of protozoology, but these hopes were not fulfilled. An assistant professorship, chiefly devoted to protozoology, recently existed in the Imperial College of Science in London; but no further appointment was made to this post after it was vacated by its first occupant. The medical schools of Great Britain have, in some instances, lecturers in protozoology, but these are mostly medical men with other work to perform and no special knowledge of the science as a whole. The schools of tropical medicine in London and Liverpool have been more fortunate, and have been able to appoint to their staffs protozoologists who can devote their undivided attention to the subject. But here again it is chiefly the practical side of the science, as applied to medicine, that is being fostered. Rothamsted Experimental Station has a protozoologist to study the subject in its agricultural aspects, and several universities and other institutions of minor importance have members who have specialized in protozoology. Veterinary medicine in Great Britain has, however, still done little for research or instruction in protozoology.

In the British colonies and dependencies things are no better. A chair of protozoology has recently been created in India;

but as a general rule protozoological research and teaching are still being carried out under unfavourable conditions by hard-working professors of other subjects. The valuable work already done by many of these men is surely a sufficient pledge of the profits that will accrue when more adequate provisions are made.

If we turn to the United States we find that Columbia University has a professor of protozoology and Johns Hopkins an assistant professor. There is also an American professor of protozoology in the Philippines. But with these exceptions, and a few of lesser importance, protozoology is advancing in America and elsewhere by the labours of zoologists and medical men whose appointments were not primarily established for the furtherance of the science.

**RECENT LITERATURE.**—The most trustworthy of recent books dealing with the Protozoa as a whole are those of E. A. Minchin, *An Introduction to the Study of the Protozoa* (1912), and F. Doflein, *Lehrbuch der Protozoenkunde* (4th ed., Jena, 1916). See also D. Bruce and others (1903-1910), *Reports of the Sleeping Sickness Commission*, i.-xvii. (Royal Society, London); C. Dobell (1911), "The Principles of Protistology" (*Arch. f. Protistenkunde*, vol. xxiii., p. 269); C. Dobell and others (1921), *A Report on the Occurrence of Intestinal Protozoa in the Inhabitants of Britain* (Medical Research Council, Special Report Series, No. 59, London); C. Dobell and F. W. O'Connor (1921), *The Intestinal Protozoa of Man* (London); S. P. James (1920), *Malaria at Home and Abroad* (London); H. S. Jennings (1906), *Behavior of the Lower Organisms* (New York); A. Laveran and F. Mesnil (1912), *Trypanosomes et Trypanosomiasis* (2 ed. Paris); E. L. Walker and A. W. Sellards (1913), "Experimental Entamoebic Dysentery," *Philippine Journ. Sci.* (B. Trop. Med., vol. viii., p. 253).

**PRYOR, ROGER ATKINSON** (1828-1919), American jurist and politician (see 22,533\*), died in New York City March 14 1919. In 1912 he published a volume of *Essays and Addresses*.

**PRZEMYSL, SIEGES OF, 1914-5.**—The Galician town of Przemyśl (see 22,534) was first fortified in 1854, when Austria mobilized against Russia. The completely exposed position of the N.E. frontier made it imperative to lay out fortifications. The Archduke Charles had already, in 1824, called attention to this weak point. In case of an invasion of East Galicia by the Russians, the first natural obstacle capable of bringing them to a halt would be the river beds of the lower San and the Dniester, and the obvious thing to do was to strengthen this line by constructing a series of fortifications. On the San it was originally intended to build out Jaroslau as a fortress, but the decision in 1854 fell on Przemyśl. In later years a row of smaller bridge-heads and *points d'appui* arose along the Dniester, which greatly increased its value as an obstacle. In the course of one year a fortified ring of no less than 65 forts had been erected round the town of Przemyśl. The year 1870 saw the building of a permanent ring of forts finished, but the works were not a match for a bombardment by modern siege guns, owing to the very niggardly expenditure sanctioned. Although after 1883, and in the last years before the World War, the modernization of the fortress from a technical standpoint was begun and some modern self-contained forts were constructed, it was in 1914 still in a very unsatisfactory condition. The short time available for equipment between the first days of mobilization and the first siege by the Russians was indeed spent in feverish activity, but only a very small part of the neglect of the past 10 years could now be made good. The works on the ring of forts, which was 48 km. in circumference, were more or less out of date. Only 12 of them could be considered "bombproof," while all the rest were only "shellproof," and even so only against 24-cm. bombs and 15-cm. shells of old-fashioned construction. The *points d'appui* for the infantry and the battery emplacements lying between the forts were almost without exception only splinterproof shelters, and some were mere field fortifications constructed of wood and earth. The infantry line running through this was protected by wire obstacles, generally only three rows deep. In front of the line of the ring of forts one enormous task had to be undertaken in preparing for the defence—the clearing of the foreground. No less than 18 villages and from 7 to 8 km. of forest were levelled to the ground. Numerous barracks, ammunition magazines, communications, bridges and other buildings, had still to be erected within the ring. The armament of the fortress was also

on a very low footing, consisting of about 1,000 guns in all, of which more than half were short-range weapons for ditch defence, and in *tradiiores*. These were 12- and 15-cm. cannon dating from 1861, 15-cm. mortars dating from the 'eighties, and 8-cm. cupola, disappearing cupola, and minimum port guns of old construction. About 450 of the guns were distant defence guns, being for the most part old 9-cm. field guns (M 75/96) with a range of only 6 km. Of modern guns the fortress at the beginning of the war had altogether only four 30.5-cm. mortars, with a range of 9.5 km., and 24 8-cm. field guns, dating from 1905, effective up to 7.5 kilometres. The distant defence guns also included some 12-cm., 15-cm. and 18-cm. siege cannon, dating from 1880, 10 10-cm. and 15-cm. cupola howitzers made in 1899, 15-cm. mobile howitzers of the same year, and 24-cm. mortars made in 1898. As regards munitions the average provision was 500 rounds per gun, and not even that in the case of the modern mortars. For all the four 30.5-cm. mortars taken together there were 300 rounds in the fortress. Of machine-guns there were altogether 114, one-third of which were built into the forts, leaving two-thirds for mobile use.

For the purpose of provisioning the fortress an estimate of 85,000 men and 3,770 horses had been established. In peace time one month's supplies were stored in the fortress, with the understanding that an increase to three months' should be made during the arming period. The Austro-Hungarian Higher Command did its utmost at this time to increase the store of supplies, and, by making full use of the available railways and motor columns, succeeded in provisioning the fortress for four months and a-half. These precautions were all the more justified as, at the last moment, the garrison was augmented by the addition of the 23rd Honved Inf. Div., two field tramway sections and other minor formations, which brought up its strength to 130,000 men and 21,000 horses. At this strength the fortress was provisioned, not for four and a-half, but for three months.

The actual garrison of the fortress at the beginning of mobilization consisted of the Austrian 111th and the Hungarian 97th Landsturm Inf. Bdes., one reserve squadron, one reserve battery, 40 companies of garrison artillery, 44 Landsturm artillery brigades, 7 companies of sappers, and the essential sanitary and labour detachments. When the Austro-Hungarian armies retreated behind the San, after the breaking-off of the battle of Lemberg-Nawa Ruska, there were added to the fortress command (under Field-Marshal-Lt. Kusmanek von Burgneustädten) the Austro-Hungarian 93rd and 108th Landsturm Inf. Bdes. and the 23rd Honved Inf. Division. Earlier additions had been: two Hungarian march regiments, of which, however, one was handed over to Jaroslau and Radymno, one Hungarian Landsturm hussar unit, and lastly a group consisting of four battalions formed out of various Landsturm formations, auxiliary police and others, cut off from the main body. All in all, the fortress establishment, when the last man of the mobile armies had left the zone, consisted of: 61½ infantry battalions (of which 40½ were Landsturm), 7 squadrons, 4 field-gun batteries, 43 fortress-artillery companies, 48 Landsturm artillery brigades, and 8 sapper companies; also sanitary corps, military and Landsturm labour detachments, fortress and tramway formations, balloon detachments, telegraph, telephone and radio formations, and so forth. The value of the troops shut up in the fortress may best be judged by the facts that two-thirds of them were Landsturm, including therefore older and less trained men, and that the formations which had been fighting on the open field were reduced to nearly half their strength. There had been, since the beginning of the World War, only two brigades to take duty in the fortress, and one of these even was sent temporarily to the IV. Army Command. The rest of the troops in the fortress were therefore not over-familiar with the duty of the fortress.

The Russian siege army, commanded by Gen. Radko Dimitriev, consisted originally of the whole of the III. Army, with the IX., X., XI. and XXI. Corps and parts of the IV. and VIII. Armies. When the Austro-Hungarian forces resumed the offensive in the beginning of Oct. 1914, the Grand Duke Nicholas withdrew three divisions of the III. Army from the circle of

\* These figures indicate the volume and page number of the previous article.

lost numbers by making excessive demands on his remaining brave divisions which he sacrificed literally to the last man.

Kusmanek had tried to prevent the withdrawal of the Russian divisions by a sortie of the 23rd Honved Inf. Div. with 12 battalions and 7 batteries in the direction of Rokietnica. Radko Dimitriev's plan was, while keeping up the bombardment against the whole ring of forts, to make a demonstration on the N. front and direct the main attack on the S. front against the Siedliska group. The Russian infantry had gradually worked its way up to the ring of forts. The number of siege batteries had been successively augmented—mainly long-distance 10-cm. field-gun batteries, but also some 15-cm. and 21-cm. batteries.

When the Austro-Hungarian offensive had begun on Oct. 4 there was no more time to be lost. The bombardment was doubled in intensity, and on Oct. 5 a *coup de main* was attempted by a Russian division against the Siedliska group. But the attack was broken by the fire of the defenders, and the division streamed back to its positions, losing heavily. On the 6th three other divisions met the same fate, when, after a bombardment of the N. and S. fronts had increased to the utmost violence, they attempted to take the Siedliska group by storm. Kusmanek, not to be misled by the Russian demonstrations, had recognized in time the direction in which the main attack would be delivered and had raised the strength of the most exposed section of the defence (Section VI.) from 11 to 25 battalions and increased its artillery to some 350 guns.

The crisis came on Oct. 7. The 76th Inf. Regt. of the Russian 19th Inf. Div. had on the previous night crept up unnoticed to Fort I. and the infantry lines adjoining it. At dawn one battalion of the regiment succeeded in entering the fort. After a furious battle, heroically led by the commandant, Lt.-Col. Svrjuga, the 149 survivors of the Russians who had forced an entry laid down their arms. The courageous garrison had withdrawn to the interior of the fort, defending it section by section, and all attempts to smoke them out and kill them failed. The neighbouring flanking batteries at Hurko were able to prevent Russian reinforcements from coming in. While this attack was in progress the 66th Reserve Div. on the Grodek Road, the 60th and 13th in front of Jaksmanič, and the 3rd Rifle Bde. on the S. front had lost heavily by unsuccessful assaults.

In the night of the 7th to the 8th the Russians renewed their furious attacks but without penetrating at any point. A general attack, which was to have followed on the next day, did not take place; and only the Siedliska group was again the object of assaults by Radko Dimitriev's decimated divisions, both morning and evening. This last desperate effort also failed completely, and bled the Russians so severely as to put a complete stop to their attacks from that time onward. After more than 72 hours of embittered fighting a gradual *détente* set in, none too soon for the overstrained nerves and spirits of the defenders.

On the 9th the first effects of the approaching relief were felt. In the course of the night the Russian cavalry divisions on the W. front had withdrawn, and during the day the investing ring began to be opened by the troops on the N. and S. fronts, while those on the S.E. and E. fronts gradually retired to their positions in the line of investment. With the entry into the fortress of the first Austro-Hungarian cavalry patrol on the evening of the 9th and of infantry detachments on the 11th, the relief of Przemysl was accomplished.

Of the Austro-Hungarian armies the III., under Boroevič, advanced direct on Przemysl. Three corps of this army forced a battle upon portions of the siege army N. of Przemysl, and, on the 11th, beat them back across the river, now greatly swollen by a downpour of many days, with enormous losses. The Russians thereupon entrenched themselves on the E. bank of the river. The Russian VIII. Army now established itself on the heights S.E. of Przemysl up to the Chyrow-Sanok area. The III. Army, at a good distance, faced the E. front of Przemysl.

Radko Dimitriev had imagined that he could subdue Przemysl in a very short time. But all these enormous sacrifices proved vain. During a siege of barely three weeks he had lost nearly 70,000 dead and wounded without having any results to show,

for the works of the fortress had suffered very little, and the Austro-Hungarian losses were quite small. On the other side the brave conduct of the Austro-Hungarian defenders had saved a powerful fortress which, in the forthcoming battles on the San, afforded a good basis as a *point d'appui* for the field armies and was able to come to their aid when their supplies failed.

*Period Between the First and Second Sieges.*—When the Austro-Hungarian armies on the San and S. of the fortress as far as Chyrow advanced to attack along the whole front, the hope of an interval for reconstruction, which the fortress so urgently needed, was by no means realized. On the contrary, lying as it did in the centre of the battle front, it was obliged to take a most active part in the battle now developing, lending garrison troops to the field armies on the one hand and helping generously with the provisioning and supplies on the other.

Very soon after the relief the 23rd Honved Inf. Div. was withdrawn to reinforce the III. Army. It played a successful part in the hardest battles, especially distinguishing itself in the storming of the strong Magiera height.

Altogether there were taken from the garrison, which also made repeated sorties onto the foreground of the E. front, 22 battalions and 27 batteries. Further assistance was given by the artillery support from the ring of forts.

Even greater than the active part taken in the battle, and far more lowering in its effect on the garrison, was the support in material given by the fortress to the field armies. During the long rainy period before the relief the lines of communication for the fresh drafts of the armies had become an absolute bog. In addition to this, the Russians in their retreat had systematically destroyed roads, bridges and railways (the railway termini were Rzeszow and Zagorz), to the great detriment of the system supplying the armies. It was only natural that every deficiency that arose in the armies, in so far as it could not be made good by transport from the rear, should be supplied by the fortress, which, in spite of all, possessed considerable reserves of material. The fighting armies, from whose attack far-reaching results were expected at the time, had at all costs to be maintained in good fighting condition until the railways were reconstructed.

As it was confidently expected that the borrowed stores—about 21 days' rations had been supplied by the fortress—and the munitions and other material could be replaced almost immediately, the fortress came in the end to be considered as, to all intents and purposes, the base of supplies for the armies. Presently the Army Higher Command realized the mistake that had been made in this matter, and not only forbade all further withdrawal of supplies from the fortress but, in the days immediately preceding the retreat, ordered the armies in their turn to provide it with supplies. On Oct. 28, too, railway communication was restored by way of Chyrow, after the repair of the bridge at Nizankowice, and masses of supplies began to be hastily poured into the fortress.

Yet another burden was imposed upon the fortress by the bringing into it of the wounded and of prisoners, in addition to the very large number of civilian inhabitants. The wounded, it is true, were evacuated almost at once into the interior, before the second siege, but during the second siege 2,000 prisoners were brought into the fortress, and 18,000 civilians had remained within it. So that, taking the average establishment at 128,000 men and 14,500 horses, there were, at the time of the second siege, 148,000 men and 14,500 horses to provide for. By eking out supplies to the utmost, and in the end slaughtering horses, the provisioning of the fortress would last until the second half of March. If the working of the railway coming up through Chyrow had started one week earlier, no supplies need have left the fortress, and its stores would undoubtedly have been replenished on such a scale that it could have held out until the spring offensive had come into effect. The starving-out of the fortress, which forced on its commander the heart-breaking decision to capitulate, and the setting free of the Russian armies investing it would then have been avoided.

*Second Siege, Nov. 6 1914–March 2 1915.*—On Nov. 5 the fortress was isolated for the second time, after the field armies

had broken off the battle of Przemyśl and the San in the night. Once more Kusmanek was confronted with the same tasks as in September. Shortly before the retreat of the field armies the fortress had been reinforced by the 85th Landwehr Bde. and a company of airmen. The strength of the garrison was approximately the same as at the beginning of the first investment. In order to extend the fortress's sphere of action, and to force the Russians to keep their line of investment at a greater distance from the actual ring of forts, at the same time obliging them to use more forces for the occupation of the longer line, Kusmanek had new foreground positions laid out. These formed a curve beginning at the Na Gorach height, and, passing 2-3 km. in front of the western ring of forts, came out S.E. of Krasieczyn at the old foreground position. From Helicha this position was extended to the S. of the fortress through Złota Góra up to the Siedliska group. This measure secured a double advantage: it placed another obstacle in the way of the attacker, who would have to surmount it before he could assault the ring of forts; and the works would suffer far less from the bombardment, as the siege artillery would be forced to remain farther away from the fortress. On the 9th the investment of the fortress was completed for the second time. The Grand Duke Nicholas had selected the Russian XI. Army under Gen. Selivanov for the siege. This army, consisting of about four infantry and one to two cavalry divisions, had barely half the forces used in the first siege under Radko Dimitriev. This circumstance, and the comparatively small activity shown by the Russians at the beginning of the second siege, pointed to the conclusion that Selivanov was less concerned with a rapid seizure of Przemyśl than with the idea of a regular siege, in which he would effect a saving of men on his own side while exploiting the scarcity of food supplies in the fortress, leaving the garrison to grow weak from starvation before he advanced to a serious attack. Kusmanek, on the other hand, displayed all the more activity. The months of Nov. and Dec. he employed in aggressive defence, and only desisted when the decimation of his forces by disease forced him to do so. In nine sorties he seized every possible opportunity of damaging the enemy, of preventing any withdrawals from his forces to the field armies; of destroying his supply trains and lines of communication, and finally of bringing into the fortress any food-stuffs—such as fruit and vegetables—which could be collected. In Dec., when the Austro-Hungarian armies took the offensive again, these sorties gained in importance, for each important action undertaken by the fortress with the object of containing Russian forces was necessarily a great disadvantage to the Russians defeated in the battle of Limanowa-Lapanow. Above all, in the case of a successful advance by the right wing of the III. Army, the possibility of co-operation between that wing and the sortie troops was not excluded.

On Nov. 7 and 12 further sorties were undertaken in the direction of Nizankowice and Kormanice. On the 14th, following on a report by the airmen of movements of Russian forces through Pruchnik to the W. and S.W., an assault was delivered on Rokietnica by 17 battalions and 10 batteries. For the same reason an equally powerful sortie was made from the S.W. front on the 20th, the main force moving on Cisowa, and the side columns towards Krzywca and the Szybenica height.

In Dec. the Russians also became more active. Having let Nov. go by without doing more than prepare a more or less systematic siege, they now began their attacks and turned Dec. into a month of many battles. Quite at the beginning the 82nd Inf. Div. advanced against the N. front. Kusmanek delivered a vigorous counter-blow from the area of Mackowice against the enemy's right flank and repulsed the attack. On Dec. 9 this action was followed by yet another sortie by 19 battalions and 10 batteries from the S.W. front, with the object of preventing the departure of the Russian 81st Inf. Div.

In the middle of Dec., when the battle of Limanowa-Lapanow had reached its height, Kusmanek received an order from the Army Higher Command to deliver a fresh assault. In the hope of being able to join hands with Krautwald's group, advancing on the right wing of Boroevič's army, Kusmanek prepared for a

great undertaking. With 23 battalions and 15 batteries, commanded by Field-Marshal-Lt. von Tamásy, he pushed forward on the 15th in the direction of Bircza and Krzywca. After four days of victorious fighting, the heights halfway between Cisowa and Bircza were captured, the enemy driven back along the whole of the S.W. front, and the road to Bircza laid open. But as Krautwald meanwhile had been forced back by the Russians, and as the hope of effecting a junction with him had become a forlorn hope on account of the great distance intervening, and as, further, a fresh violent attack had been launched against the northern foreground position, Na Gorach, Kusmanek found himself obliged to turn his attention to this latter, and to recall Tamásy on the 19th to the fortress.

Once more it was the Russian 82nd Inf. Div. which advanced on Na Gorach. Portions had already penetrated the advanced positions when Kusmanek's counter-attack set in on the 20th, and on the 21st threw them back to the line of investment.

At the end of Dec. yet another order from the Army Higher Command led to a fresh sortie. After the battle of Limanowa-Lapanow the Russians, taking advantage of their interior lines, had opened a counter-offensive against the troops of the III. and IV. Armies which had pushed forward into West Galicia. The proposal was for a sortie to be made in a south-westerly direction, falling in with the left flank of the Russian attack on the one hand, and on the other making a second attempt to effect a junction with the III. Army's right wing, which was pushing forward towards Lisko, Sanok and Rymanow. But with the suspension of the offensive on the 28th the sortie troops were brought back.

This sortie brought the offensive activity of the garrison to a close for the time being, in consideration of their ever-increasing losses through fighting and sickness. All forces were now to be reserved for the effort on a large scale to relieve the fortress, which was planned for the middle of February.

The month of Jan. saw the beginning of a period of great self-denial and sacrifice for the garrison, in consequence of the increasing scarcity of food. The commandant and his staff had in addition the difficult task of maintaining the striking power of the garrison with insufficient means, which involved exacting the maximum of service from each individual soldier in spite of his lack of nourishment. On Dec. 1 1914 Kusmanek, counting upon a delay in the relief operations, had ordered the first general reduction of rations for men and horses. At the end of the month the first horses were killed for the purpose of providing meat and saving fodder. Had the fortress been consuming its full rations it could not have held out beyond the end of Jan., but by the reduction of the ration and further slaughter of horses (up to 7,450), supplies were eked out until the end of March. The extension of the life of the fortress was in proportion to the establishment of horses it was necessary to keep up. For the projected break-through sortie and for the absolutely essential fortress duties a minimum establishment of 4,500 had to be allowed for. By means of further reducing the ration, resorting to incredible makeshifts, and sacrificing 3,500 more horses, the provisioning was made to last until March 24, but there was a rapid mounting-up of the sick list. By the beginning of March one-fifth of the fortress establishment had fallen. To the scarcity of food was added in the winter months that of clothing, footwear and all the other necessities of life. The garrison had been equipped, for the most part, with summer clothing, and even this had been badly damaged in the fighting. In respect of technical and artillery supplies also, the fortress gradually lost its power of resistance. The barrels of the guns had been gradually burnt out by the excessive demands made on them, and the range of the guns declined accordingly. The stores of ammunition were also rapidly coming to an end, despite the utmost economy.

While the striking power of the fortress was suffering sensibly from all the unspeakable privations imposed by hunger, cold and want, the besiegers were gradually becoming more active. At first the Russians confined themselves to increasing the airmen's activity. Almost every day their airmen circled round the fortress, with very little hindrance from its quite inadequate means of defence, dropping bombs on the forts and the town. In

the beginning of Feb. the systematic bombardment of the fortress set in. In the middle of the month the besiegers brought up the line of investment nearer to the N.W., W. and S.W. fronts. On the night of the 18th three regiments attacked the foreground position at Pod Mazurami, but were beaten back with heavy losses. It seemed to the Russians that the garrison's striking power was still too strong; and they let three weeks pass before equipping themselves for an important attack. On March 13 a powerful Russian force advanced against the N. foreground position Na Gorach-Batycze. Against so strong an attack, delivered by at least two regiments, the 35th Light Inf. Regt. could make no stand. As other powerful Russian forces were advancing against the N. front from Radymno, and as Kusmanek considered his own garrison too weak for a counter-blow and also wished to save his forces for the great final break-through, he gave up the foreground position and refrained from counter-attacking. At the same moment the Austro-Hungarian Higher Command had reached the conclusion that the II. Army's offensive would not be able to bring about the desired relief of the fortress, which was therefore inevitably doomed, since the food supplies would be exhausted by March 24.

A break-through from the fortress might conceivably save a portion of the garrison for the Austro-Hungarian army forces, and it had therefore to be attempted. In consideration of the state of supplies, March 19 was fixed as the latest time limit for its execution. Kusmanek had already made all the necessary preparations. He was free to choose the direction in which the sortie was to be made. His decision fell on the E., as it appeared to him impossible for his exhausted men to effect a junction with the II. Army through the mountainous area. On the E. the ground was practicable, and he might hope to have an opportunity there of destroying Russian railway lines and communications, and also possibly to have the good fortune to capture a Russian supply store. In case the break-through failed, he would then be able to take back provisions into the fortress and so prolong its life by a few days.

With two infantry divisions and three independent infantry brigades (50 battalions, 6 squadrons and 18 battalions) the break-through was begun on the morning of the 19th. After some opening success the troops, in a heroic seven-hour battle, fought their way up to the Medyka heights, coming to a stand here at 10 A.M. A flanking counter-attack by the Russian 58th Reserve Div., which had been brought up from the Carpathians, then forced them to return to the fortress, their losses being heavy on account of their exhaustion. The fate of the fortress and the garrison was now finally sealed. The Russians realized the aim of this last sortie, and they had captured on prisoners the order regarding it; they therefore knew that the fortress was almost at the end of its power of resistance. Kusmanek now awaited their attacks. All the sortie troops had returned to their old positions on the 19th. The same night the Russian masses made a violent assault on the E. front. Until the morning of the 22nd Selivanov exerted himself to the utmost to take the fortress by storm. An endless bombardment by the heaviest-calibre guns set in, and was followed by assaults on the N.W., N. and N.E. fronts, as well as on the E. front and the foreground position, Pod Mazurami. But the brave defenders held their ground and repulsed one attack after another. At last Kusmanek, armed with authority from the Army Higher Command, decided to destroy the fortress, since it was now quite impossible to save it. On March 22 between 5 and 6.30 A.M. just as renewed Russian attacks had begun, the works were blown up as far as possible; all guns, the small remaining store of ammunition and the technical arrangements were demolished, all arms broken, motors and other vehicles burnt, and the remaining horses shot. Kusmanek then sent a *parlementaire* to the Russian siege army. When the conditions for the surrender had been fixed the Russians entered the town to take over the administration.

Kusmanek betook himself at once with his staff to Selivanov's headquarters. The garrison,<sup>1</sup> which was allowed all military

honours and looked upon even by the enemy as a model of military bravery, remained about another week in Przemyśl, and was then removed in large detachments by way of Lemberg. On the 24th the Russian General Artamanov took command.

After four and a half months of heroic defence the fortress of Przemyśl had fallen, through hunger and sickness. To the brave garrison, and in the first place to the determined commandant, Gen. von Kusmanek, and to Gen. von Tamásy, leader of most of the sorties, the highest admiration was due, and the victorious enemy, whose own courage was proved by the enormous tribute of lives sacrificed before the forts and ramparts of the fortress, recognized this in full measure.

*Recapture of the Fortress, May 30–June 3 1915.*—Soon after the fall of the fortress of Przemyśl the Russians had taken in hand the reorganization of its works. Particularly after the visit of the Tsar, who inspected the destroyed works in the second half of April, the reconstruction was taken in hand with feverish haste. Numerous heavy guns, including French ones, were brought into the fortress, and a strong garrison was maintained. By the middle of May Böhm's and Puhalló's armies had advanced in a concentric attack on the positions S. of the fortress, as well as on the S.W. and W. fronts, while Mackensen's army pushed forward in the area N. of the fortress and over the San. While the Allied armies were thus advancing on Przemyśl the Russians were undecided whether to hold the fortress or not. By the middle of May they had begun the work of evacuation and the withdrawal of troops. But in the second half of the month the idea of holding the fortress gained ground, and the Grand Duke finally ordered it to be held "to the last extremity." When Mackensen's army began its offensive on May 24 on both sides of the Szkło in a south-easterly direction, the fortress became more and more closely surrounded to the N. also by the ring of investment. By the 30th the necessary heavy artillery had also been brought up, in spite of the delay caused by the ruined roads and bridges, and the bombardment of the S.W. and northern fronts immediately began. These were the two fronts against which the attack was to be directed. While the X. Corps of Puhalló's army stormed the S.W. front, the Bavarians of the XI. Army, in conjunction with one Prussian infantry regiment, one Guard battalion, and the dismounted troops of the 11th Honved Cav. Div., executed the main attack on the N. front.

Misled by the violence of the attack of the Austro-Hungarian infantry regiments (the 9th and 45th of the X. Corps), who, on the 30th, stormed the Pralkowce fort, on the S.W. front, Work VII., the Russians awaited the main attack there and brought their whole strength into play against the X. Corps. But although they were able to force the Austrians to evacuate the fort, they could not themselves recapture it. Meanwhile the Germans had done good work on the N. front. Their bombardment was mainly directed against the forts, X., Xa., XIa. and XI., lying between Ujkowice and Dunkowiczki, and for this guns of all calibres, including the 42-cm. mortars, were used. On the 31st, after heavy fighting, ending in a *mêlée*, Forts Xa. and XIa. were taken, as well as the adjacent infantry positions, and Fort XI. capitulated. On June 1 the Russians brought up strong reserves, but not in time to avert the fate of the fortress. On the morning of the 2nd Fort X. fell into the hands of the attacking forces after its obstinate resistance had been overcome by a liberal bombardment. By the evening Fort XII. had also been captured, and Forts IXa. and IXb. surrendered to Maj.-Gen. Berndt's cavalry. The break-through of the ring of forts had succeeded. North of Zurawica the Russians made one more stand; but this line had also been forced by the evening of the 2nd, and the Russians betook themselves to their last line of resistance immediately in front of the nucleus. But the attack did not get as far as this, for the Russians abandoned the fortress on the night of the 2nd, influenced probably by the successes attained by the XI. and II. Armies. Their rearguards took up new positions on the E. front of the fortress on the line Medyka-Siedliska.

At 3 A.M. the Bavarians of Lt.-Gen. Kneusel's division entered the fortress from the north. Maj.-Gen. Berndt followed from the N.W. with the Austro-Hungarian 4th Cav. Division. By 6

<sup>1</sup> In round figures 107,000 men, among whom were 28,000 invalids both fit and unfit for transport.

A.M. the Austro-Hungarian X. Corps had also come in. But the attacking forces did not remain long in the evacuated town. In a hurried pursuit they overran the Siedliska position and pushed forward to the E. of the town.

The fall of Przemyśl fortress, which had been subdued in barely four days, meant for the Russians the loss of the most powerful pivot of their San front. Not without reason had the Grand Duke—who had tried to gain a success over the IV. Army by a violent assault at Rudnik during the hard struggle for Przemyśl—ordered the fortress to be held "to the last extremity." By its fall the forces of the Austro-Hungarian III. Army and the German XI. Army were set free, and could go to the aid of the dangerously situated IV. Army. On the 4th the Russians abandoned the San front. Thus the recapture of Przemyśl, apart from the great moral impression it made, was decisive also in a strategical sense. (E. J.)

**PSYCHICAL RESEARCH (or SPIRITUALISM)** (see 22.544) — The matters referred to under the general name "Psychical Research" are distinguished from ordinary subjects of scientific interest by two characteristics. They appeal to the sense of wonder and the love of the marvellous and are concerned with "superstitions," that is, with beliefs which, after being ingrained in the human soul by an immemorial past, are now disavowed by science, but still affect human action. Secondly, they seem to involve abnormal extensions of human faculty, and are readily taken to indicate a survival of human personality after death, and a possibility of obtaining authentic communications from the departed. They consequently arouse strong emotional reactions, provoke strong dislikes and are peculiarly susceptible of vitiation by self-deception, bias and fraud. Hence they are usually treated in a partisan spirit on both sides, like matters of politics, and not with scientific impartiality, and the good faith as well as the competence of the witnesses have always to be tested and every allegation has to be verified. In all these respects the subjects of psychical research are intimately bound up with the religious; but it would be a mistake, nevertheless, to relegate them to the "supernatural," and hastily to declare them unfit for scientific investigation. Their investigation is difficult, but not impossible, provided that in a given society it is favoured or permitted. Of course, if it is proscribed as "sorcery" and made a capital offence, as was the case all the world over until recently, investigation will languish, and it may well be that the practice of burning psychics as "witches," persisted in for many centuries, has effectively eliminated most of the possessors of unusual faculties. However, to begin with, the term "supernatural" should be discarded. It merely assumes what is the cardinal point at issue, viz. that the realm of nature has been completely explored; and only omniscience could assert this. The allegations to be inquired into by psychical research, therefore, should be described, neutrally, as "supernormal."

Nevertheless, the peculiarities of the subjects of psychical research condition further differences which should be noted in any account of their history. They render the influence of public opinion far more important than it is in the ordinary subjects of scientific inquiry. It is true, doubtless, that everywhere the progress of any subject of human interest depends on two factors, on the quantity and quality of human intelligence devoted to its elucidation, and on the social atmosphere, *i.e.* the attitude towards it taken up by public opinion. Of these the former is ordinarily more conspicuous and important, for it directly affects the progress made. The latter acts indirectly, by affecting the amount and sort of the attention paid to a subject, and its effects do not all lie on the surface. But if there is in a society a real desire for more knowledge on a subject, research into it will be organized; inquiries will be set in motion, adequately equipped and endowed, and the conduct of such inquiries will become a career. If, on the other hand, there is little interest, nothing will be done; as also if knowledge is supposed to be absolute or adequate, or if its absence is held to be inevitable and is acquiesced in. If, lastly, the knowledge sought is feared or disapproved of for any reason, various measures will be taken for effectively repressing interest in it, nor must it be supposed that

such social taboos cease to operate merely because witch-burning has ceased to be a popular entertainment. In general; moreover, subjects which are inchoate and contentious are far more sensitive to changes in the social atmosphere than those which are recognized, established and endowed. For toward the latter the social attitude is fairly stable and changes only slowly, and they possess, moreover, a permanent organization, which provides for their cultivation (or is supposed to do so), and on which their progress mainly depends. In the case of the former, progress may depend chiefly on the social attitude, and indeed may even consist chiefly in a change of social attitude. It is unreasonable, for example, to expect progress in psychical research so long as the energies of researchers have to be devoted primarily to eluding the police or the officers of the Holy Inquisition.

The history of psychical research during the decade 1910-20 provides excellent illustrations of all these reflections. It is composed of a short pre-war period of obscure labour in the cold shade of social neglect, a short eclipse due to the complete immersion of all scientific workers in the pursuits and passions of the World War, accompanied by a grotesque ebullition of superstitions long supposed to have become extinct, and followed shortly afterwards by an astonishing revolution in social sentiment, which rendered psychical research popular and reputable as it had never been before, but is now slowly yielding and relapsing into the pre-war tone of feeling. Before the World War the great bulk of public opinion was either hostile to the subjects of psychical research, or at any rate indifferent to their scientific investigation: That, at least, seemed to be the obvious construction to be put upon the general indifference towards scientific psychical research, and was borne out by the results of a *questionnaire* intended to test the extent and depth of the desire to have knowledge of the most exciting of these subjects, viz. the individual's survival after death. The answers, as analyzed by the writer in the *Proceedings* of the Society for Psychical Research (pt. 49, 1904), seemed to indicate that such a desire was actively functional only in comparatively few minds at any one time, and that these were nearly always excited by the stimulus of a recent bereavement. This explanation seemed, moreover, to account sufficiently for the ordinary social attitude towards the subject. For it would follow that under normal circumstances the great majority, who were *not* animated by the bereavement-sentiment, would effectively repress the few who were, and would mould public opinion and social institutions accordingly—as had manifestly happened—both to scientific and to religious "orthodoxy." But it would also follow that if for any reason the bereavement-sentiment should become widespread, powerful and dominant, it might be predicted that there would ensue a great outburst of interest in psychical research, and a passionate demand for any method that held out to the bereaved human heart the immediate consolation of a direct communication with the departed.

Accordingly this is what happened in consequence of the World War. If we put aside, as mere "propaganda" for the benefit of the superstitious, the crop of bogus prophecies that accompanied the outbreak of war, and such successful appeals to primitive credulity as the legends of the "Russians from Archangel," and of the "Angels of Mons" (the latter, though published as *fiction*, was actually taken as *fact*), we find that at first the normal peace-sentiment persisted. It remained engrossed in mundane affairs and showed itself by a complete and exclusive absorption in the war. Nothing else seemed to matter, and scientific inquiries that did not minister to the war were simply dropped in an ecstacy of patriotic fervour. It seemed, therefore, the sheer waste of a guinea to continue to subscribe to an inquiry whether the human lives that were sacrificed so prodigally on the battle-fields were really dead and done with. No wonder the membership of the Society for Psychical Research in England went down from 1,205 in 1913 to 1,055 in 1916.

Meantime, beneath the surface of social convention, the bereavement-sentiment was growing to proportions unparalleled in civilized history. It was merely awaiting a signal to reveal itself. The signal was presently given, in a high academic

quarter, by the courageous act of a bereaved father, who did not shrink either from exposing himself to academic ridicule or from divulging the private evidence which he had obtained of his son's survival and declaring that he had satisfied him. That a distinguished physicist at the head of the university of Birmingham should openly endorse spiritism was a remarkable event: yet Sir Oliver Lodge's *Raymond* was not in itself a remarkable book. Evidentially it did not show that Mrs. Leonard produced anything markedly more conclusive and better in quality than the evidence obtained long before through Mrs. Piper and other "psychics"; nor was there anything remarkable about the quantity of its evidential communications. Hardened sceptics should have had no difficulty in explaining away the "hits" it narrated, as they had dealt with its many predecessors. Nor did its version of the after-life differ markedly from the descriptions of the "summerland" that had been the staple of spiritist literature for the past 50 years, while its apparent crudities, e.g. of ghosts smoking "cigars" and drinking "whiskies-and-seda," were no less susceptible of a "symbolical" explanation.

But what turned out to be remarkably different was the reception of the book. It was found that patriotism paralyzed the voice of criticism. The scoffing reviewer, who had been accustomed to say that interest in psychical research was "morbid" and a sure passport to the lunatic asylum, or that the mystery of the grave was insoluble and that anyhow no sensible man had the slightest desire to solve it, was no longer regarded as the sort of person to express what the public wanted to hear about a book of that kind. So he was not allowed to touch it, or perhaps himself experienced a change of heart. Able editors perceived that, in war-time, consolations that appealed to millions of bereaved hearts must be treated tenderly, if only to keep the home front unbroken. So *Raymond* was reviewed respectfully and copiously, and enabled to break down the barrier of peace-time convention. A flood of lesser books followed, ascribed to the living or returning dead, and mostly composed of communications received by relatives of fallen soldiers, through automatic writing—not without an admixture of pious fraud. Unfortunately they were mostly written by people who paid little or no attention to the difficulty of getting evidential communications and of making their value apparent to their readers, and who considered the mere form of the communication as a sufficient authentication, being wholly ignorant of psychology and of the tricks they were, unconsciously, capable of playing on themselves. Nor did amateur automatism alone profit by this innovation. Professional "psychics" obtained an enormous vogue. The resignations from the Society for Psychical Research ceased, and accessions took their place. The membership went up from 1,055 in 1916 to 1,305 in 1919; and the new members were not only willing to pay the two-guinea subscription of a "member" instead of the guinea of the "associate," but insisted on a more active and enterprising policy; and came within measurable distance of "hustling" this eminently respectable society into an endorsement of spiritism.

Of course a change in the social attitude produced in this way cannot be permanent. The old influences persist, and will inevitably reassert themselves and produce a relapse into the former apathy; unless the exceptional opportunities are exploited, and the abnormal will to believe is fortified by positive achievements. In the long run, therefore, the status of psychical research will depend, not on the mere intensity of the desire to know and the amount of social approval it can secure, but on the amount of solid scientific work that will have been accomplished under the stimulus of the abnormal social conditions. It is necessary, therefore, to turn to the scientific side of psychical research, though the developments here will be found to have been relatively small and by no means commensurate with the volume of popular interest excited by the war.

Nevertheless a certain amount of scientific progress has been made, enuring both to the benefit and to the detriment of psychical research. It may be classified under the following heads: (a) Psychology, (b) Multiple Personality, (c) Telepathy,

(d) Trance, (e) Automatic Writing, (f) Physical Phenomena, (g) Dowsing, (h) Thinking Animals.

Psychology during the war made considerable progress because numbers of academic psychologists were compelled to practise, and to apply their theoretical conceptions to clinical problems, while numbers of medical men, finding themselves unable to cope with the profound disturbances of mental equilibrium, inaccurately, but conveniently, designated as "shell-shock," were compelled to reckon with the psychical side of medicine. Thus were large bodies of intelligent men forced not only to apply their theories to concrete cases, and to correct them by their working, but also to recognize the power of the disordered mind to simulate the most various lesions and diseases of the body. As might have been anticipated, the older systems of academic psychology, being compiled out of aesthetic preferences, metaphysical prejudices, methodological assumptions, introspective observations of conscious states, and highly artificial and limited laboratory experiments, did not stand the test of application to the battle-field at all well.

The "psychoanalytic" method, however, devised long before by Dr. Sigmund Freud of Vienna, for tapping the unconscious depths of the mind and bringing their contents to the surface was found to be capable both of explaining the symptoms and in many cases of suggesting a cure. Hence though the psychological theory on which Freud worked had seemed (and been) improbable, extreme and crude, and had (justly) encountered the strongest emotional repugnance, there was no gainsaying the practical validity of his method, and the reality and importance of the mind's unconscious structure. The mind had to be conceived, like the spectrum, as having invisible (unconscious) extensions, as truly characteristic, as susceptible of investigation, and in some respects as important, as its visible (conscious) regions. It had in consequence to be admitted that psychic contents could be "repressed" into this unconscious region without thereby losing their identity and reality, and could thence continue to produce effects in consciousness, even by those who refused to follow Freud in assigning none but an erotic motive to this repression. These psychological discoveries had a considerable bearing on several branches of psychical research. They seemed to throw a flood of light on the mechanism of multiple personality. A "repressed complex" could explain the growth of a "secondary self." They also modified the notion of "fraud."

Not only was it clear, as had indeed already long been recognized by investigators, that a secondary or trance-personality might perpetrate a fraud of which the primary or normal self might be innocent, incapable and unaware, but a personality of either kind might become unaware of the fraud it had committed by "repressing" its knowledge thereof. Thus the problem of the fraudulent medium was enormously complicated, and it could be suggested, as by Dr. Culpin (*Spiritualism and the New Psychology*, London, 1920), that even the most honest mediums were frauds, who had cleared their consciences by "repressing" the knowledge of their delinquencies. Furthermore, this same process might be used to explain many errors and gaps in the narratives of observers of supernatural occurrences. Having "repressed," as unwelcome, the real facts, they might honestly deny that they had ever possessed or divulged the knowledge they were bent on regarding as supernatural: it would thereupon appear to be so. Hence repression of the truth would have to be added as a third to mal-observation and forgetfulness, as a very subtle source of error in testimony to the occurrence of the supernatural; and would further complicate the problem of what the evidence really proved. On the other side it is fair to remember that whatever goes to show how little we really know as yet about the functions of the mind should act as an encouragement to psychical research, and renders more credible *pro tanto* claims to unsuspected powers.

In the field of multiple personality Dr. Morton Prince has extended and confirmed his brilliant researches, attending particularly to the proof of the reality of "coconscious" secondary selves (*cf.* his *Unconscious*, 1914). It will doubt-

less have gratified the readers of his *Dissociation of a Personality* (1906) to learn that "Miss Beauchamp" was afterwards happily and healthily married though her husband did not know what a heroine of psychological romance he had espoused. The most striking and substantial contribution to the subject is, however, contained in the admirably recorded and narrated story of the strange case of "Doris Fischer," for which science is indebted to the Rev. Dr. Walter F. Prince, who in consequence became interested in psychical research, and subsequently (1920) succeeded the late Prof. J. H. Hyslop as secretary of the American S.P.R. The record extends over three large volumes (1915, 1916, 1917) of the *Proceedings* of the American S.P.R., contains almost 2,500 pages of print, and is fully worthy of such elaborate treatment. It narrates how, as a little girl of three, "Doris Fischer" was thrown down violently by her drunken father, and so sustained a psychic fracture, which "dissociated" her into "Margaret" and "Real Doris," the former being a personage very similar to "Sally" in the "Beauchamp" case. But for 19 years no one discovered the dissociation, and even her mother only thought Doris a little odd and forgetful, when as "Real Doris" she displayed ignorance of what "Margaret" had just said or done. At the age of 16 another painful scene, at her mother's death-bed, led to a further dissociation and the emergence of a new personality. "Sick Doris" was born mature, grave, hardworking and conscientious, but totally ignorant of everything that had happened before her birth. Again the dissociation escaped detection, because "Margaret," whose "mental age" never rose above 10, undertook to instruct her uneducated partner, and succeeded, at the cost of all-night sittings and violent quarrels. Between these two the "Real Doris" was for six years almost completely crowded out. How she was restored by the skill and tact of Dr. Prince, after he had taken charge of the girl and discovered her condition and how first "Sick Doris" and then "Margaret" were weakened by being put to sleep whenever they cropped up, and grew younger and younger under this treatment, and in the case of "Sick Doris" actually infantile, until they finally evaporated, may be read in Dr. Prince's fascinating record.

Theoretically the case (which was fully reviewed by the present writer in *Proceedings S.P.R.*, pt. 74: cf. also the article by Dr. T. W. Mitchell in pt. 79) is important also for two reasons. In the first place it brings out that the dissociations were plainly *protective*, and relieved the strain of an otherwise intolerable life. Secondly, they were attended by a considerable number of supernormal incidents which, though not unprecedented in other cases of dissociation (e.g. the "Watskesa Wonder"), had not formerly been recorded properly. Indeed, if one can accept the record in vol. iii. of the sittings "Doris Fischer" had with Dr. Hyslop's medium "Mrs. Chenoweth," these incidents were the clew to the whole affair, and the dissociations were caused by, or complicated with, spirit-possession. But this interpretation is not apparently accepted by Dr. Prince, and is something of an exercise on the main story.

*Telepathy.*—Little progress has been made in establishing telepathy as a process in nature. It remains a sort of half-way house for those who do not feel able to deny the supernormal altogether and yet shrink from the spiritist interpretation. It fulfils this function best if its nature and operation are left vague, so that anything and everything may be set down to telepathy of some sort. Hence believers in "telepathy" have not any strong motive for coming to close quarters with their theory, while the more intelligent spiritists dislike it as rendering any conclusive proof of spirit-identity practically impossible. The opponents of the supernormal first use it freely to disparage the evidences of spiritism, and thereupon frequently proceed, somewhat illogically, to cast doubts upon its own reality. Telepathy, however, has one great advantage, that of being susceptible of experiment. Unfortunately such experiments as are undertaken not only do not succeed in increasing our knowledge of its conditions, but hardly even confirm the earlier experiments on which the existence of telepathy is based. The most noteworthy of the experiments that have yielded positive results were those

undertaken by Miss Miles and Miss Ramsden, published in the *S.P.R. Proceedings*, pt. 69 (1914). On the principle that anything supernormal may be attributed to some sort of "telepathy," one might perhaps chronicle here the very anomalous *Adventure*, experienced by two well-known academic ladies of Oxford in the gardens of Versailles, but not published until six years after the event, in 1911 (cf. the review in *S.P.R. Proceedings*, pt. 64).

On the other hand, elaborate attempts made by two psychologists in America to verify the existence of telepathy have led to results which at first sight appear to be wholly negative. Dr. J. E. Coover, of Leland Stanford Junior University; was specially endowed as a psychical researcher by the brother of its founder, and in due course produced in 1917 a book of 640 pages. Among its rather miscellaneous contents (it contains *inter alia* a pleasing account of the outwitting of a fraudulent "trumpet-medium" by hidden machinery) he describes 100 series of 100 experiments with cards (court cards omitted) made by 100 pairs of Californian students, for the purpose of testing the existence of telepathy as a faculty widely, diffused in some slight degree among human minds. The "agent" was instructed to draw a card and to determine by casting dice whether to look at it or not, and in the former case to try to impress his knowledge (without contact) on the percipient; while the latter had to answer in both cases, but for about half the time would thus be really guessing at random. The results, when tabulated and added up, yielded in the first series of 5,135 genuine "experiments" 153 complete successes (most probable number, 128), in the second series of 4,865 control experiments or "guesses" 141 complete successes (most probable number, 122).

There was therefore a slight excess of successes, but Dr. Coover rightly argues that it was too small to be significant of anything beyond chance. He claims therefore to have disposed of the idea that telepathy may exist in minimal intensity in *all* minds, and evidently thinks that this disposed of the whole case. This, however, would seem to be going too far, on his own showing. For his figures do *not* dispose of the possibility that telepathy may exist in a faint degree in *some* minds. Indeed they rather suggest this possibility. For if we examine them with a view to testing this hypothesis, we may select, as *possibly slightly telepathic*, the series in which the "percipients" got 3 or more complete successes in their "experiments." There were 14 of these, in which 54 complete successes were scored in 711 experiments. The most probable number being 18, the excess is now large enough to be significant of something beyond "chance." But not, apparently, of telepathy, so much as of a sort of "lucidity" or "clairvoyance." For if we treat the (supposedly fortuitous) series of "guesses" similarly, we get still more remarkable results. The series with 3 or more complete successes once more turns out to be 14, and yields 49 complete successes out of 600 experiments (most probable number, 17). But curiously enough 5 of the 14 best "guesses" are identical with 5 of the 14 best "experiments." As the most probable number for such a coincidence is only 2, it can hardly be fortuitous. Moreover, if we add together the "experiments" and "guesses" of these 5 series, we get 41 complete successes out of 500 experiments, as against a most probable number of 12. Again something beyond "chance" is indicated. As, however, this something operates about equally well whether the percipient is trying to determine a card which was actually being thought or is only guessing, it can not be set down to conscious telepathy. This again accords with the other evidence that goes to show that telepathy, if it exists, is not greatly dependent on the conscious efforts of the mind; or otherwise, that if minds communicate telepathically, it is by way of the subliminal. For the rest, of course, the moral is that further experiments should have been conducted with the 5 successful pairs, in order to determine whether they would continue to produce a surplus of successes; but unfortunately this idea did not occur to Dr. Coover.

Dr. L. T. Troland also experimented in telepathy, with very elaborate apparatus, in the Psychological Laboratories of Harvard University (1917), in order to utilize an endowment given in memory of Richard Hodgson (cf. review in *S.P.R. Proceedings*,

pt. 80). He, too, got negative results, and did not go on long enough. In fact, he failed so completely that he failed even to prove that telepathy did not exist, or that at any rate he and his colleague were completely devoid of telepathic ability. Only 605 experiments were made, and only 284 complete successes were obtained. Now this is very sensibly *below* the most probable number (302); but, as Dr. Troland observes, an abnormal deficiency is quite as significant of something other than chance as an abnormal excess. It may mean the presence of some factor that *inhibits* success, and if this can be established, it is just as supernormal as one that *produces* success. However, Dr. Troland does not hold that in his experiments the deficiency is sufficiently great. He has not observed how it arose. His total figures were arrived at by lumping together two sets of experiments. In one of these the stimulus shown to the "agent," to which the "percipient" was to react by pushing an instrument either to the right or to the left, was exposed for 30 seconds; in the other, for 15 seconds. Now in the former series there was no deficiency of right reactions; 129 successes out of 249 experiments are slightly *above* the probable number, 124. The whole of the deficiency was incurred in the 15-second series, which yielded only 155 successes out of 354 experiments, instead of a most probable 177. As the only difference between the two series was in the duration of the exposure, the idea easily suggests itself that the 15-second exposure was too short to enable the percipient to react rightly. And not only that; it seems to have positively inhibited the right reaction, presumably by inducing an "anxiety-neurosis." In other words, if the "agent," or more probably the "percipient," got "flustered" by the shortness of the exposure, his very knowledge of the right reaction would lead him to make the wrong one. Thus a marked deficiency in correct responses over a long series might imply as much supernormal knowledge, and yield as good evidence of telepathy, as a marked excess; much as it is implied in the "negative hallucination" of a hypnotic subject that he both sees and does not see, the object of the hallucination, and indeed that he *must* see it (subconsciously) in order to avoid it. Again, however, the series of experiments was not long enough to make the appeal to the calculus of probabilities decisive. For the present, therefore, it is best to conclude that the reality of telepathy is not yet either proved or disproved: the evidence is just about enough to keep it alive as a hypothesis.

*Trance.*—The phenomena of trance continue to be studied, and although Mrs. Piper, the most famous "medium" of this type, was pensioned by the S.P.R. and retired so long ago as 1910, she has no lack of successors. Indeed, the great majority of the customers of "psychics" frequent trance-mediums. Their manifestations continue to be much the same; entranced psychics become obsessed by one or other of their regular "controls"—usually grotesque personages that cannot be identified, and may fairly be suspected of being creations, at least to a large extent, of the medium's subliminal imagination. There are poured forth (in the "good" sittings one hears about) masses of details about the sitters and their concerns, often hesitant, inconclusive, vague, sometimes wrong, often non-significant, but sometimes so startlingly apposite as to shake all but the sturdiest scepticism. The evidence presented in Sir Oliver Lodge's *Raymond* was obtained in this way; Miss Radcliffe-Hall and Lady Troubridge have recorded similar evidential sittings with Sir Oliver's chief medium, Mrs. Leonard, in S.P.R. *Proceedings*, pt. 78. Mrs. Sidgwick produced a final and monumental review of the Piper case in S.P.R. *Proceedings*, pt. 71 (1915).

As regards the theoretic interpretation of these trance-communications, the tendency, even among those most inclined to believe that they convey authentic messages from the departed, is to complicate the process of communication. It is recognized more and more that there have to be reckoned with, not only the medium, with his natural limitations of faculty and training, but the medium's "subliminal" or subconscious, the medium's "controls," who are supposed to transmit the messages from the communicator proper, and possibly the effects of abnormal conditions, not only in the medium (trance-personality)

but also in the "control" and "communicator," owing to the effort to communicate. It is evident that these complications may account for many errors and obstructions; but they detract *pro tanto* from the authenticity of the actual communications.

*Automatic Writing.*—Automatic writing continues to flourish and to furnish psychical researchers with large masses of raw material. But its quality is not equal to its quantity, and its interest is for the most part psychological rather than evidential. Nevertheless a few cases of automatism laying claim to scientific importance may be noted. Undismayed by the failure of Mrs. Verrall to get, through automatic writing, at the contents of a sealed letter left, before his death, by Frederic Myers with Sir Oliver Lodge (cf. S.P.R. *Journal*, Jan. 1905), many of the leaders of the S.P.R. continued to work at cross-correspondences, and the results of their labours bulk large in the *Proceedings* of the society 1911-9. They discovered some curious cases among the writings of their automatists, the most remarkable perhaps being that entitled *The Ear of Dionysius* (1917), which was worked out by Mr. Gerald Balfour, and held to indicate the *post-mortem* agency of Prof. Verrall. But unfortunately the value of the coincidences on which the method relies is not capable of exact determination, and the whole method of proving spirit-identity by cross-correspondences is too literary and recondite to be appreciated without an intellectual effort, and so fails to impress the ordinary man. The automatic writing of a Dublin lady, Mrs. Travers Smith, excited some interest, both on account of the enormous speeds attained in its method of production (a planchette travelling over an alphabet under glass), and because of the claim that communications had been received from Sir Hugh Lane, before it was known that the *Lusitania* had been sunk, and that he had been one of the victims of this outrage. The case is narrated in *Voices from the Void* (1919).

Great interest was excited when Mr. Bligh Bond, in his *Gate of Remembrance* (Oxford, 1918), announced that he had been guided in his excavation of Glastonbury Abbey by the automatic writings of a friend who produced copious communications, largely in very debased Latin, from a number of the monks who had inhabited the Abbey from the 11th to the 16th century, and had revealed the correct location and dimensions of the Edgar Chapel, though all the extant antiquarian evidence had made these statements seem quite improbable. Mr. Bligh Bond also had the courage to print in the first edition of his book similar predictions about the Loretto Chapel, of which the remains had not then been found: when, after the war, excavation was resumed, these also were found to be correct substantially—*i.e.* allowing for the facts that the original script was in some points capable of more than one interpretation and that the excavators did not always hit upon the right one. Cases of practically valuable information received in a supernormal manner are extremely rare, and Mr. Bligh Bond's is one of the best of them.

*Physical Phenomena.*—To pass from automatic writing to physical phenomena is to pass from the least to the most contentious of the subjects that concern the psychical researcher, from a region where the facts are admitted and the interpretation alone is in dispute, to one where fraud has to be guarded against at every step and where *all* the facts are suspected by some to be due to it. Not that fraud is excluded in the former case: automatic writing can be simulated (like anything else) and with a little luck and ingenuity organized deception can be effectively practised with great success, as is amusingly shown in E.H. Jones's *The Road to Endor* (1920), describing how two British officers beguiled the tedium of their captivity and fooled both their comrades and the Turkish officials in charge of their prison camp. In fact, fraud is so easy that nothing depends on it; it is recognized by all competent inquirers that the whole value of automatic writing depends not on the mode of production but on the evidential character of the contents. In dealing with physical phenomena, on the other hand, the elimination or discounting of fraud is the primary consideration; the more so that fraud is certainly abundant, and that the conditions seem designed to facilitate it. This should be recognized by both sides, and should be no reason for refusing absolutely to investi-

gate cases in which *prima facie* the evidence is good, and fraud is absent or, apparently, impossible. As for the conditions, it may conceivably be that just as photographs must be taken in the light and developed in the dark, so the curious growths to be described presently can only be developed in more or less complete darkness. But the inadequacy of the lighting, even in cases where red light is allowed sufficient to distinguish the hands and faces of the sitters, is a valid reason for demanding that the deeds done in the darkness of the séance-room shall be mechanically controlled by adequate substitutes for the sitters' senses of sight and touch, which the darkness puts out of action or renders untrustworthy. To secure this control, it would probably be necessary to construct a special laboratory in which extensive machinery (incapable of forgetting or being hallucinated) would record all the physical changes going on during the sitting. It reveals a curious lack of seriousness in the human attitude towards psychical research that no such laboratory had yet been provided anywhere.

In spite of these drawbacks, however, physical phenomena will not down. There have been plenty of frauds, and plenty of exposures, including that of an Italian medium of international fame, Eusapia Palladino, who began the decade well with a favourable Report by Mr. Everard Feilding and Mr. Baggally on a series of sittings she had given them in Naples (S.P.R. *Proceedings*, pt. 62, 1911). These investigators, though they reported many movements of objects they could not account for, nevertheless emphasized that Eusapia needed continuous watching because she always cheated when she was given the chance. The chance was given her when she went to America in 1909, and the result was a very handsome and complete exposure, which eclipsed her reputation, even though many of her patrons continued to hold that nothing new had been proved against or about her mediumship, and that it was not wholly fraudulent. Still she died obscure (1918) and fashion took to other mediums.

At present a somewhat different type of physical phenomena is in vogue, in which puzzling movements occurring within the radius of the medium's arm or foot are no longer the staple of the performance, and which it is more difficult to set down to fraud, because the evidence is largely recorded in flashlight photographs, which seem on the face of it to involve the supernatural. In particular two or three cases of "materializations" seem to be deserving of further study. The first of these is connected with a French lady known as "Eva C.," whose mediumistic career goes back to 1906 and the "Villa Carmen" sittings at Algiers, which ended in the customary charges, and denials, of fraud. Some years later she turned up in Paris, living in the house of Mme. Alexandre Bisson, and her materialization phenomena speedily attracted attention. Early in 1914 the chief German psychical researcher, a medical man, Dr. von Schrenck-Notzing, published a lavishly illustrated book, *Materialisations-Phänomene*, on the materializations of Eva and the similar performances of a Polish girl, Stanisława P.; owing to the war it was not translated into English until 1920. It describes the elaborate precautions taken against fraud and to secure the genuineness of the "materializations"; but the extraordinary flashlight photographs of the plastic substance out of which they were built up are even more convincing than the physiological reports on its character. It is shown exuding from various parts of the medium's body, chiefly the mouth (whether or not the head and the hands were enclosed in muslin bags), hanging about the body in festoons, and forming itself into fingers, hands and faces, which are often incomplete and usually flat and picture-like. This of course gives a measure of support to the only explanation which the sceptics have so far been able to exogitate, viz. that the pictures are first swallowed by the medium and then "regurgitated." This theory, however, hardly explains how they manage to reappear so unruined, or how the "plasma" is got through the muslin bag when the medium's head is sewn up, and back again. Nor does the medical and microscopic examination of small samples of the plasma which Dr. von Schrenck-Notzing was allowed to take confirm a stomachic origin: its character appears to be epithelial. The reports of Mme. Bisson and Dr. von Schrenck-

Notzing were subsequently confirmed by a French medical man, Dr. Gustave Geley, in a lecture given to the Psychological Institute at the Collège de France in Jan. 1918, on "Supernormal Physiology and the Phenomena of Ideoplasty," and in the summer of 1920 "Eva C." was very searchingly examined by a committee of the S.P.R. in a series of sittings held in London: phenomena were not as copious as in Paris, nor on so large a scale; but their general character was confirmed, and no trace of fraud was detected (*cf.* S.P.R. *Proceedings*, pt. 81).

The "materializations" of "Eva C." seemed at first to receive independent support from the mediumship of Miss Kathleen Goligher of Belfast. This medium, and the family circle in which she sat, were exhaustively studied by Dr. W. J. Crawford, a lecturer in mechanical engineering in the local university, who described his conclusions in a series of books; *The Reality of Psychic Phenomena* appeared in 1916, *Experiments in Psychical Science* in 1919, while the third, *The Psychic Structures at the Goligher Circle*, delayed by the author's sudden death, appeared in Feb. 1921. They formed a graduated series, growing more and more sensational in their results, and in the end actually represented as visible facts what had originally been suggested as hypothetical inferences. In his first book Dr. Crawford, while candidly admitting that he believed the directing intelligences concerned to be departed human spirits, set himself to study the mechanics of the phenomena observed, raps, levitations of the table, and other movements of objects, after establishing their supernormal character. For this purpose he used photographs, manometers, spring balances and a variety of weighing machines, in a red light "nearly always" sufficient to show plainly the hands of the sitters, and proceeded to determine *exactly* the amount and incidence of the forces employed in producing the movements. As a result of his experiments, he came to the conclusion that the mechanical effects observed could only be explained by postulating hypothetical structures, with a definite shape, connecting the bodies moved with the body of the medium at her ankles. These structures, which he called "psychic cantilevers" and "psychic rods," though invisible and intangible, had a size, shape and position which could be mapped by observing at what points the phenomena could be stopped by interposing between the medium and the objects moved.

In his second book Dr. Crawford extended these results, and showed that ordinarily the weight the bodies levitated was added to that of the medium (as if she held them), while when this psychic substance was weighed in a weighing pan at a distance from the medium, her weight would simultaneously be reduced; he claimed to have observed a temporary loss in this way of as much as 54 lb., nearly half her normal weight. He also stated that he obtained impressions on clay of the ends of such a "cantilever column." Finally these structures became visible, and his last book is adorned with flashlight photographs appearing to verify the correctness of his deductions about their origin and application. Moreover, in appearance they curiously resembled the "plasma" issuing from "Eva C." By ingeniously applying moist dyestuffs to various points in the stockings and underclothing of the medium, Crawford claimed to have determined the course taken by this "plasma" in issuing from, and returning into, the body of the medium, declaring also that he had felt the collapse and recuperation of her muscles which accompanied these processes. As his narrative stood, the Goligher case appeared to provide the most impressive evidence ever obtained for the reality of "materializations." Dr. Crawford's premature death in 1920 made it temporarily difficult to pursue independent inquiry into the matter; but at the end of 1921 further investigation by Dr. Fournier D'Albe proved that the manifestations were fraudulent.

Observations of so-called "telekinetic" phenomena, *i.e.* movements of small objects such as celluloid or pith balls, match-boxes, teaspoons, balances, etc., without contact, in the presence of a Polish lady, Stanisława Tomczyk (now Mrs. Everard Feilding), who had been "dissociated" in consequence of experiences during the Warsaw riots of 1906, were reported by Prof. I. Ochrowski of Warsaw in the *Annales des Sciences*

*Psychiques* (1909-12), and confirmed by Dr. von Schrenck-Notzing in 1913-4. Some of the photographs appeared to give a clue to the mechanics of these phenomena by showing very fine threads connecting the hands of the medium and passing beneath the object levitated. It is argued however, partly on the strength of the negative results of investigating the medium before and after the phenomena, partly on the ground of differences in the appearance of these threads and of cotton, silk and hair (illustrated), that the threads were of a psychic and supernormal character, and in fact plastic emanations similar to those of "Eva C." In the summer of 1914 the medium came to London to be examined by the S.P.R., but the outbreak of war prevented the continuation of the investigation.

Another branch of physical phenomena is represented by what is called "spirit-photography." In this, as in the (now extinct) method of "slate-writing," everything depends on the prevention of fraudulent substitutions in the plates (or slates). If this is neglected, the production of "spirit-photographs" becomes easy enough. One of the earliest practitioners of this art, William Keeler, has recently suffered annihilating exposure of his "Lee-Bocock" frauds at the hands of Dr. W. F. Prince (Am. S.P.R. *Proceedings*, vol. xiii. 2, March 1920), after having had his case stated in *Proceedings*, vol. viii. (1913), of the same society. Other cases of "spirit-photography" may be said to be still under investigation, and, though none had in 1921 been proved genuine, their detection is usually a highly technical matter. Dr. Prince has also convincingly shown by a critical study of the evidence that an old "poltergeist" case, "the Great Amherst Mystery" (1879), was in all probability due to the (unconscious) fraud of the medium, who had been "dissociated" by a shocking event in her personal history, which she had, apparently, "repressed" (Am. S.P.R. *Proceedings*, vol. xiii. 1, 1919).

"Dowsing," as a method of finding water in dry places, continues to be used with considerable success, and it is certainly impressive to find that certain firms of well-sinkers regularly employ dowsers, and are so confident about their skill that they are willing to make contracts on "no find, no pay" terms. It is said, however, that they then (not unreasonably) protect themselves by charging higher rates. The subject was somewhat actively debated in Germany shortly before the World War, because the German governor of South-West Africa had a cousin who was a water-finder, and employed him with great success (cf. *Das Landrat von Usars Arbeiten mit der Wünschelrute in Südwest Afrika*, Stuttgart, 1912). A pamphlet by A. J. Ellis, issued by the U.S. Geological Survey (*The Divining Rod*, Washington, 1917), though it dismisses the matter dogmatically as a mere superstition, has a useful bibliography.

*Thinking Animals*.—Before the World War Germany was also the chief home of a vigorous dispute about "thinking animals," which must be noticed in this connexion, not only because allegations of supernormal faculty were made, but because the logical problems involved, the difficulties in ascertaining the facts and in guarding against deception, and the partisanship of the disputants, were identical. For though at first the issue appeared to be simply a question of zoological fact, to be decided experimentally by biological and psychological experts, it soon appeared that not only was there the usual divergence between conservatives and progressives, but that the experts were divided by the conflict between the tendencies to emphasize the unity of life and to affirm the supremacy of the human mind; moreover, when, as was soon the case, a considerable amount of *odium theologicum* was imported into the discussion, a similar division was observable among theologians. The result was a complete replica of a controversy in psychical research. The trouble began so long ago as 1904, when Herr von Osten produced a horse, his "Clever Hans," which he had taught to do simple sums by tapping with his hoofs. He had proceeded on the logically false assumption that mathematical thought is peculiarly arduous, and on the biologically false assumption that to discover unsuspected extensions of animal intelligence would be particularly cogent in directions remote from the natural interests of the beast. However, "Hans" indisputably tapped

out the right responses in the presence of his master, and even (though rarely) in his absence, and the scientific scandal became so great that an inquiry had to be made (by order of the Ministry of Education); as a result the explanation was adopted, with the approval of the Berlin psychologist, Prof. Stumpf, that the observant animal reacted to slight, unconscious indications given by the experimenter. Thus there was neither thought nor fraud, but only visual hyperaesthesia (cf. Pfungst, *Clever Hans*, English translation, New York, 1911).

Officially this report was supposed to settle the matter. But an Elberfeld gentleman named Krall was not satisfied. He bought "Clever Hans" after von Osten's death, and examined his visual acuity, finding it to be  $2\frac{1}{2}$  times that of a man. He also trained up a whole stud of equine mathematicians, that became famous as "the Elberfeld horses." Among them one turned out to be a genius, "Muhammed," while another, "Berto," was blind, and so incapable of visual hyperaesthesia. Elberfeld became a place of pilgrimage; a multitude of books, pamphlets and articles appeared (cf. Krall, *Denkende Tiere*, Leipzig, 1912); a review was founded for the recording of the prodigies of animal thought (*Tierseelen*, 1913). Presently, at Mannheim, an invalid lady took to exhibiting a thinking dog, "Rolf," who, though not so mathematically minded, appeared to be gifted with a rare sense both of philosophy and humour. True, the animal refused to "work" unless held by a chain, and this procedure naturally fostered suspicions that the natural brilliance of his mind might have been improved by a little judicious wire-pulling; but there arose plenty of reputable observers to testify that the chain was kept slack, and even some to declare that "Rolf" had been known to answer correctly in the absence of his owner and had furnished answers not known to any human mind: the opposition, therefore, could only attack the competence of the observers, and sometimes succeeded in showing that they had been laxer than they had imagined. Yet, despite the indignant protests of those who claimed to have vestiges of common sense or knowledge *a priori* of where the limits of the possible were laid down, the open-minded (like Darwin), not afraid of "fool" experiments, went to see, and were duly puzzled: even eminent psychologists, like Prof. Claparède of Geneva, reported favourably, more or less. A poet, Maeterlinck, came away from the horses with the conviction that the phenomena were supernormal; and was satisfied that horses, dogs and cats were by nature "psychics," while elephants, monkeys and asses were not and, unlike the former, could not tap the cosmic reservoir of potential knowledge. The said "reservoir" was hypothetical, but seemed to be needed to provide for the correctness of answers not known to any human mind, and so transcending "telepathy" (which had also been suggested) (cf. *The Unknown Guest*, Eng. trans., 1914, p. 267).

Clearly, this question of "thinking animals" exhibits the tantalizing perversity of other problems in psychical research. The truth about it is not a problem in pure science, and is not susceptible of settlement by its methods. For these demand that the good faith of the observers can be presupposed and that undistorted observation of the facts is possible, both conditions often far less completely fulfilled, even in the established sciences, than is usually assumed. In the unreclaimed borderland between superstition and science neither condition can be satisfied; every "fact" may prove to be real only as a hallucination is real, or to be distorted into a monstrous *mirage* by prejudice and bias, while the will to believe (and equally the will to disbelieve) is so free to select, to emphasize, to interpret, that it can create practically any "fact" it chooses. In short, truth in this region is unmistakably emotional; men's attitude towards it essentially resembles their attitude in religion or in politics; the abstraction from human feeling (or rather from every feeling but the desire for knowledge), which is postulated in the ideal of pure reason, is simply impracticable here. So long as every "fact" adduced on either side has to be treated as suspect, and every step is contentious, scientific progress, if it is possible at all, cannot be otherwise than slow. There is only one way for believers in the supernormal to shortcircuit this procedure: if they can apply

their beliefs to the ordinary course of reality and show that they develop so much practical value that they must be reckoned with, they cannot in practice be treated as false. If, for example, secrets were regularly discovered, and information transmitted, by "telepathy," if fortune-tellers frequently told their clients how to make fortunes, and business "clairvoyants" were employed by financial houses, this pragmatic proof would be irresistible, and would suffice to convince the world. Actually, however, the pragmatic test rather tells *against* belief in the supernormal: for the supernormal knowledge believed in is not taken to be trustworthy normally; nor do believers in it act on it, thus betraying the fact, which they may not realize themselves, that they do not take their beliefs quite seriously. In this respect they are like very many other people. For, as Prof. Carver Read (*The Origin of Man*, ch. viii., London, 1920) has shown, even among the most benighted savages believers in "magic" have always to behave sensibly, for all the extravagance of their beliefs. They pray, *but they also* keep their powder dry, and thus their action reveals which of their beliefs are only half-beliefs or make-believe.

In ultimate analysis the question becomes one of the place, function and significance of beliefs which are not quite matter-of-fact about what are not quite matters of fact. To appreciate these, we have to discard the illusion, traditionally fostered by logic, that there is no alternative to firm belief but whole-hearted disbelief. Actually the gradations and fluctuations of beliefs are infinite, and in many departments of life such unstable beliefs are normal and dominant. They can easily coexist with others, abstractly inconsistent with them, in a mind unwilling to abandon either, or perhaps unaware that it is entertaining them. Thus even Herbert Spencer showed that he had *some* belief in ghosts by his comical indignation when his hostess told him she hoped that so stalwart a disbeliever would not mind sleeping in the haunted room of a country house (*Autobiography*, I, p. 48c). The only way of redeeming from this region of incomplete beliefs that are below proof a subject of general human interest—and no others ever fall into it—is to make it part of the ordinary routine of life, which every one accepts in practice (whatever the theoretic reason he may give to himself and others), simply because no one can ignore it and live. But if ever the objects of psychical research should be effectively subjected to such a transfer, this would clearly mean a spiritual revolution of the most far-reaching kind.

LITERATURE.—This is still largely contained in periodicals. In England those of the Society for Psychical Research must be mentioned in the first place. Both the *Proceedings* and the *Journal* maintain a high scientific and literary level, and contribute, record or review all the important developments of the subject. The addresses which are delivered by presidents of the society on coming into office form an interesting record of the attitude taken up towards the subject by a number of eminent thinkers (e.g. Henri Bergson, 1913; Gilbert Murray, 1916; L. P. Jacks, 1917; Lord Rayleigh, 1919; W. McDougall, 1920). But the society's publications do not notice all the title-tattle of the movement, for which it is necessary to consult the weekly *Light* and the monthly *Occult Review*. The former is the official organ of British spiritualism, and the latter is not sufficiently critical of the material it publishes, which, though entertaining enough, appears to be often (almost avowed) fiction. In July 1920 *The Psychic Research Quarterly* began to appear, which promises to be a high-class periodical, and in its Oct. number published the first photographs of Miss Goligher's "materializations." In America the *Proceedings* and *Journal* of the American S.P.R. have the same standards as the English society. But they were long edited by the late Prof. J. H. Hyslop (d. 1920), who soon became a convinced (though critical) spiritist, and reflect his work and his views in a very voluminous and somewhat one-sided way. They are now edited by his successor, Dr. W. F. Prince, the brilliant investigator of the Doris Fischer case, and the acute critic of sundry cases of fraud. In France the *Annales des Sciences Psychiques* have published some good material and continue to give a good idea of the movement in the Latin countries. The *Bulletin* of the Institut Général Psychologique used not infrequently to contain articles on psychical research, but now that an *Institut Métapsychique* has been founded in Paris, with an ambitious programme, it is probable that in future these will appear in its *Bulletin* (no. 1, Oct. 1920). In Germany *Psychische Studien* continue. In Switzerland the *Archives de Psychologie* used often to publish valuable studies bearing on psychical research, while it was edited by the late Prof. Theodore Flournoy (d. 1920), the author of the famous study on the automatism of

"Hélène Schmidt," *Des Indes à la planète Mars* (1900), *Esprits et Médiums* (1911), and of the very remarkable study of a modern mystic "Cécile Vê" (in no. 57, 1915).

As regards books, many have been referred to above. The outstanding importance of Sir Oliver Lodge's *Raymond* and of W. J. Crawford's works on the Goligher case has been already explained under "Trance" and "Physical Phenomena." William James's "Final Impressions of a Psychical Researcher" was reprinted from the *American Magazine* in *Memories and Studies* (1911) and should be consulted for the conclusions left in the great psychologist's mind by his prolonged interest in psychical research. As books of a general character taking a favourable view of the phenomena, there may be mentioned Sir V. Barrett's *On the Threshold of the Unseen* (1917); J. A. Hill's *Spiritualism, its History, Phenomena and Doctrine* (London, 1918); J. H. Hyslop's *Psychical Research and Survival* (1913), *Life after Death* (1919), *Contact with the Other World* (1919); H. Carrington's *Problems of Psychical Research* (London, 1914), *Modern Psychical Phenomena* (1919), *Psychical Phenomena and the War* (1919). Among hostile accounts the best are I. L. Tuckett's *The Evidence for the Supernatural* (1912); E. Odd's *The Question, If a Man Die shall he Live Again?* (London, 1917) and J. McCabe's *Is Spiritualism based on Fraud? and Spiritualists: a Popular History* (both London, 1920). Prof. M. Dessio's *Vom Jenseits der Seele* (1917, 4th ed. 1920) is also unfavourable in the main, though appreciative of the attitude and work of the S.P.R., and interesting as coming from an academic psychologist who has not disdained to investigate the phenomena alleged. Dr. A. von Schrenck-Notzing's works are important (*Materialisations-phenomene*, Munich, 1914, 2nd ed. announced for 1921, Eng. translation by Dr. Fournier d'Albe, London, 1920; *Der Kampf um die Materialisations-Phaenomene*, 1914; *Physikalische Phaenomene des Mediumismus*, 1920). Dr. G. Geley's *De l'Inconscient au Conscient* (Paris, 1919) is an attempt to form a theory of the supernormal physiology of "Eva C." A translation by S. de Brath came out in 1920 (London). Lastly A. J. Philpott's *Quest for Dean Bridgman Conner* (London, 1915) may be instance as an instructive investigation of an automatic romance (communicated through Mrs. Piper), which, though plausible and partially correct, turned out to be essentially false, and to illustrate how untrustworthy information obtained through supernormal channels at present is. As medical works dealing with psychotherapy and dissociations of personality, those of Dr. Boris Sidis, who made his mark by narrating the strange case of the Rev. Mr. Hanna (cf. Sidis and Goodhart, *Multiple Personality*, New York, 1905), *The Foundations of Normal and Abnormal Psychology* (London, 1914), *Symptomatology, Psychognosis and Diagnosis of Psychopathic Diseases* (Boston, 1914) and *The Causation and Treatment of Psychopathic Diseases* (Boston, 1916), may be mentioned; also W. H. R. Rivers' *Instinct and the Unconscious* (London, 1920) and W. Brown's *Psychology and Psychotherapy* (London, 1920).

(F. C. S. S.)

PSYCHOTHERAPY.—The modern branch of medicine to which has been given the name of "psychotherapy" may be regarded as covering all attempts made to mitigate or remove such symptoms as may be attributed to the operations of an unhealthy mind. These symptoms may be mental, for instance confusion of mind, or delusions, or obsessions, and may not be associated with any bodily symptoms or only with such as are trifling. On the other hand the symptoms may be bodily, for instance paralysis, or some form of loss of sensation, or indigestion, and may not be associated with any but trifling mental symptoms. The treatment of symptoms due to mental ill-health by physical agents such as rest, exercise, change of climate, baths, electricity or drugs is not psychotherapy.

Psychotherapy has been practised in all ages, sometimes upon those patently suffering from mental or moral disorders, but perhaps even more often upon those whose symptoms in fact depended upon mental or moral weakness or disorder but in whom the affection appeared, from the superficial character of the medical knowledge of the moment, to be due to organic disease of the body. In such cases psychotherapy has enjoyed considerable success, whether practised in connexion with religion and philosophy or with superstition and charlatanism (see FAITH HEALING, 10.135). Under circumstances such as these there has always been, and indeed still is, a formidable admixture of the miraculous, and it is not intended here to examine systems like that of Christian Science or the miracles of Lourdes. The term "psychotherapy" is of comparatively recent origin and has received wide acceptance in that it usefully stands for treatment based upon scientific psychology, normal and morbid. Three methods of psychotherapy will here be considered, from the purely medical point of view: those of Moral Suasion, Suggestion and Psycho-analysis.

*Moral Suasion* is historically the oldest method, and was advanced to a high level of excellence by the Stoic Philosophers. Illness, whether mental or physical, involves, to an extent depending upon the circumstances of the case and the character of the patient, pain and discomfort, disability with the fear of its consequences upon economic and social position and the fear of death. It is principally in the relief of discomfort and pain that persuasion has its success. Many patients are seriously alarmed at any abnormal feeling in any of their organs, are apt to call such feelings painful and to colour their descriptions with such adjectives as "awful" and "terrible." Others will ascribe symptoms of a commonplace character to serious disease of some important organ,—for example, when flatulence is mistaken for heart disease or turbid urine or pain in the back is regarded as indicative of kidney disease. Merely to induce such patients to be more precise in language and then in simple terms to offer some proximate explanation of their symptoms will often, without the association of any remedial agent, place their ideas in better proportion and mitigate or abolish their pains. Therapeutics have, very naturally, up till quite recent times been dominated by the endeavour to treat the symptom of which the patient complains rather than to attack the disease which is producing the symptom. For the most part treatment has been either by frankly miraculous methods or by those which have been in part empirical and in part miraculous, that is, by those in which some wonderful and unknown factor has seemed to coöperate with the supposed remedy. It has more recently become increasingly apparent that remedial agents not uncommonly owe their seeming success firstly to the fact that most disorders pass away whether treated or not, and secondly to the fact that the mental attitude of the patient can in itself assist at his cure and that this attitude may in many persons be modified for good or ill by the physician or other attendants of the sick man. Galen long since pointed out that "when the imagination of a sick man has been struck by the idea of a remedy, which of itself is without efficacy, it becomes endowed with beneficent power." The method of persuasion seeks to use this recuperative power which lies in the patient's mental field and to set it to work either without or with the assistance of physical agents. It seeks by reasonable explanation to impress upon the patient that his symptoms are transient and that his malady is curable, that it is important for him to aid in his own cure by taking a balanced view of the ills which afflict him and to face them with hope and courage. There is not, as in treatment by suggestion, an endeavour to impose an authoritative assertion to be blindly accepted as a matter of faith, but an endeavour to secure the penetration of an idea by the power of reason, to discuss the situation with the patient and to obtain his acceptance of the case as put forward by the physician. The fear of the disabling effect of illness may also be dealt with by the physician, who may point out, where he is so justified, that on recovery the disability will pass away or that if any be left it will be of an entirely trifling character. In serious disablement and in cases of which the end is likely to be death, it becomes the duty of the philosopher and the priest to fortify the courage and resignation of the patient. Not infrequently, however, the physician, willing or not, has himself to assume their functions and to adapt his exhortations to the needs of men of various creeds and levels of culture.

That persuasion on these lines is of value as a therapeutic agent there can be but little doubt, but its chief disadvantage lies in its limited scope, in that its appeal is to highly developed and organized faculties, just those faculties with which the neuropathic are not for the most part particularly gifted and which are the first to be weakened in disease. In practice, persuasion is apt to degenerate into partial explanations authoritatively enunciated, in which the physician has to make the best he can of the ignorance of the patient and of his own necessarily meagre scientific acquisitions, and in which pure ratiocination plays a small part. In short, persuasion merges into suggestion.

*Suggestion*, as a formal method of therapeutics, is but of recent origin (see 26.48). In large measure it has been, from the

earliest times, ancillary to miraculous, magical and professional modes of healing. Under other names it has often been the only curative agent and has been used uncombined with physical agents or ritual performances, but for the most part it has been practised in combination with these. Professional or scientific medicine, though seeing no way of escape, has often sought and still seeks to have as little to do as possible with so indeterminate and varying a mode of cure. It struggles after more exact and precise results, in the fond hope that at some distant date each disorder, psychic or somatic, shall either be prevented from occurring at all or if it occurs shall be met forthwith by some one rapidly acting and efficacious medication.

The first great impetus to the use of suggestion as a formal method of therapeutics came from Mesmer during the latter part of the eighteenth century, and for well nigh a century suggestion, employed as such, was associated with hypnotism (see 14.201). The artificial induction, but not by drugs, of a state in some ways resembling sleep was first called by this name rather before the middle of the nineteenth century, and it was found that the hypnotized person was, in a great majority of cases, in a condition in which suggestions made to him were acted upon with astonishing accuracy either at once or at some subsequent time as determined by the hypnotizer, in short that his suggestibility or capacity for receiving and acting upon suggestion had been much increased. The word "suggestion" used in association with mental therapy has lost some of its precision. Few are agreed as to its meaning: no one can do more than speculate as to the mode of action implied by it. It is common to hear detractors of some cure, whether it be miraculous, or of the character of those relied on by Christian Science, or emanating directly from orthodox medicine, explain it as being "merely" due to suggestion. What is really meant by such an explanation is not always apparent, and it is desirable to restrict the meaning of the term "suggestion" as applied to therapeutics to the process in which it is sought authoritatively to instil an idea into the patient's mind with a view to the relief of some morbid process. From the catalogues of cases set forth by some practitioners it would appear that almost any affection is capable of amelioration or cure by suggestion. A more modest and a more generally held estimate would limit the cases amenable to this treatment to those of functional disorder and of organic disease in which super-added functional symptoms are a prominent feature. The difference between persuasion and suggestion, as indicated above, is that in the former an appeal is made, at least in theory, to the highest levels of the patient's mind, whereas in suggestion (and particularly in this the case when it is combined with hypnosis) directions are delivered to levels of which the patient is only partially conscious, or which he is not aware of as being concerned in the production of his symptoms, or which he does not hold to be capable of activation in their amelioration, or of which, indeed, he is wholly unconscious. In the endeavour to make use of such levels it is plain that it may be necessary to endeavour to inhibit the operations of those that are higher, since these are occupied largely and sometimes almost wholly by the miseries of the patient.

Suggestion suffers from the essential vice of the older therapy in that it is directed rather to the treatment of the symptom than to the disorder of which the symptom is but part. Movement may, for example, be restored to a paralysed limb, but the mental processes of which the movement is the outcome may nevertheless remain unhealthy. A coördinated purposive action is not wholly explained in terms of the movement of a limb, but involves preliminary sensual, perceptual, rational and volitional activities, one or several or all of which may be affected. Criticism has largely been directed against the method of suggestion in that it would seem to convert the patient into an automatic machine which responds to activation without knowing what it does or why it does it: there is obedience without reflection or judgment. Whether this be always so or not, the physician in any case is in ignorance as to which part of the whole psychological system he is operating upon; indeed he is ignorant as to which part of it is in a morbid state. Hysteria is held by many

psychologists to lie in mental dissociation, that is that the various mental processes do not coöperate harmoniously and that some are active while others are dormant. Suggestion in the hypnotic state seems artificially to procure this very state of dissociation, and in fact is widely held to induce a mental state analogous to, if not identical with, that of hysteria. To avoid so unhappy a result of a therapeutic measure as the establishment of a morbid state, endeavours have been made to practise suggestion when the patient is not under hypnosis, that is, when he is awake. It is nevertheless usual to direct the patient to allow his mind to adopt an attitude of passive receptivity, and when, if he can, he has done this to make suggestions to him. Only so far as the critical faculties are dormant are such suggestions likely to be efficacious, and if the critical faculties are dormant the method is open to such objection as may be made to hypnotism. This mode of suggestion is probably but little removed from the method of persuasion, the physician hoping that his case may be accepted under the guise of suggestion with a minimum of adverse criticism.

The term "auto-suggestion" has been used to denote a process in which the patient himself attempts to exercise a salutary influence upon his malady by concentrating his thought upon the idea of his cure or by, as it were, commanding his symptoms to disappear. The operation may be assisted by the withdrawal of the patient to a quiet place, by his placing himself in an attitude of repose and by his endeavour to empty his mind of all ideas save the one which is curative. Given sufficient intensity of purpose a man may by such treatment of himself rise superior to the ills that afflict him, think or act in spite of them, and, indeed, in certain cases annihilate them. It is not, however, given to many to reach success on these lines. Afflicted man seeks two things, one to know what really is the matter with him and the second to obtain succour from forces external to himself; he ardently desires a diagnosis and a healer. The desire for correct diagnosis is necessarily shared by him who aspires to be a scientific physician, prompts the constant search for the cause of symptoms and inspires the hope that, a cause being discovered, treatment will be more radical and effectual. Such ideas have led to the inquiries which of recent years have been instituted into the development of the human mind, both from the racial and from the individual aspects, and have resulted in new methods of mental analysis.

*Psychological analysis* (or "psycho-analysis") has been practised by the method of introspection for centuries. It involves the examination of his mind by the individual himself and the attempt to differentiate between such mental operations as those of feeling, knowing, reasoning, wishing and willing. Such inquiries eventuated in difference of opinion and ceaseless controversy as to the spheres of these faculties, as they were called; nor was the introspective method, owing to the difficulty of getting it efficiently practised by patients, of much value in morbid psychology. The newer methods of analytical psychology as applied to morbid mental manifestations, or to such bodily symptoms as might be supposed to be due to disordered mental processes, have addressed themselves to the discovery of a presumed basic causative idea, its association with other ideas, and its genesis.

The earliest signs of mind in the individual have the character of reflexes, that is, that upon the reception of a certain stimulus by the organism a particular series of movements ensues. Some of these pass by the name of instincts, are of a complicated character, and appear to occur without previous experience and without education or direction from without. Very early, however, in the history of the child the play of instinct is controlled, repressed or supplanted by positive injunctions from others, by the inculcation of habits, by lines of thought and conduct suggested to him by his observations of those about him, by his desire to imitate their doings and to repeat their sayings, and by his personal experience. The purely natural development of the child is interfered with in order that he may be fitted for life in a civilized society. During this process certain actions initially pleasurable come to be regarded as unconventional, or repre-

hensible, or shameful, or immodest, or all of these together, and so gradually rules of thought and conduct come into being. Almost all, and perhaps all, thoughts and actions are associated with some emotional tone; that is, with feelings of pleasure or displeasure or pain. Such feelings are of varying intensity, being in some cases so weak that they can scarcely be discerned and in others so powerful as to occupy and command the entire personality. During the education of the child a separation may be brought about between an action and the associated emotional tone or affect, as it is termed. If a child has learnt to regard a pleasurable act as blameworthy and in fact acts no longer in this particular way, the affect which was associated with the act may become partially or wholly detached from it and may perhaps be replaced by its opposite. It is one of the hypotheses of psycho-analysis that a dissociated affect of this character may produce symptoms at once or in later life, either because the affect has not been passed on to some other important or more legitimate object of activity and remains as a quantum of unused psychic energy, or because it has become attached to a substitute for its original partner of unworthy or ridiculous character. The gradual passing on of affects from lower levels of activity to those that are higher has been called sublimation, and their progress from the satisfaction of very lowly bodily wants to the highest ethical and aesthetic acquirements of the mind has been elaborately examined. The failure in attachment of an affect to any sort of substitute for its original partner may result in those indefinite emotional states, sometimes of a distinctly morbid character, in which the individual may be happy or miserable or excited or apathetic for no reason which is obvious to himself or to anyone else; while the attachment of affects to somewhat trifling and comparatively valueless objects is seen in the inordinate interest taken by some in domestic pets, bric-a-brac, pastimes, or fantastic and inane social entertainments. Sometimes, however, the affect remains unconverted and still attached to the original act, so that a conflict arises between the primitive and personal desires on the one hand and desires of later acquisition weighted with civilized, ethical, legal and religious authority, on the other. Many such conflicts are plainly carried on in full consciousness, and are examples of the lust of the flesh against the spirit and of the spirit against the flesh and of the contrariness of the one to the other, but others are by no means so obvious, and their existence may only betray itself by trifling, though odd, deviations from ordinary conduct, by unexplained prejudices and habits, or by symptoms of functional nervous disorder or by the yet more pronounced symptoms of insanity. The conflicts which lie in the field of consciousness may largely be dealt with, in so far as they come under the notice of the physician, in that field. The mere disclosure to another of the existence of a conflict may suffice to produce a therapeutic effect, and this may be further enhanced by the discussion of the subject and its illumination by another mind, but there are conflicts in which the opposing elements and their origin and genesis are not apparent or recognized or indeed discoverable without much labour. Such conflicts are said to lie in the field of the unconscious and to be due to the persistence in that field of repressions made at that time of life when the instinctive desires of the individual, tutored by early environment and education, have undergone a process of restraint. By a wide, and as it seems to some, unnatural extension of the term "sexual" the interest of the infant in its excretory functions and its relations with its parents is ascribed to the sexual instinct, and is that which, owing to existing social conventions, is most subject to repression. It is held that the relations of the child to his mother have an element of sexuality hitherto not determined. Hence the frequent occurrence of such terms as the "Oedipus Complex" and "incest" as descriptive of certain infantile affects. It is further held that the earliest interest of a child in itself is of a sexual character, that it is "auto-erotic." Progress is made from this stage to another in which the child's sexual admiration for himself is termed "narcissism"; then to one in which the interest is extended to other members of his own sex, and finally to one in which sexuality

becomes centred upon the normal object, that is upon the opposite sex. This development may be arrested at any point, and the arrest may later in life be displayed in various sexual perversions. If a person in whom such an arrest has occurred, say, at the stage of homosexuality, is living in a civilized society, difficult internal conflicts are likely in later life to ensue between the strength of his desires and his fear of outraging both social convention and legal enactment; or, owing to the fixation of his affect upon an object, not the normal end object of the sexual instinct, he may find himself impotent in his relations with one of the opposite sex. The efforts of psycho-analysis are directed towards the discovery of repression, arrest of development and the conflicts which are thus generated. If these can be brought to light there is hope that further development may occur, that unattached or badly attached affects may find appropriate and fitting objects, and that conflicts may be resolved by the coordinating action of the conscious.

Analysts are not, however, in complete agreement as to whether sexuality is the sole or essential cause of functional nervous symptoms. Some find in the desire of the individual to express his influence upon others, or his "will to power," an active determining cause of the internal conflict which arises when he finds himself in opposition to social conventions and to such activities of those about him as tend to impede his progress. Others again seek to find conflicts not so much in the past development of the individual as in the difficulties which arise when he endeavours to attain such ideal ends as he has proposed to himself. But whatever the value attached to the elements of causation of morbid states there is general agreement that it is not only the conscious field with its obvious conflicts which has to be explored but that the unconscious field should also be examined in as much detail as is possible.

The form of the content of the unconscious and of the conscious mind appears to be determined by analogous processes. Perceptions are apparently not invariably noted by the conscious. It is not an uncommon experience to discover perceptions which must have been made at a certain time and place which only well up into consciousness at some later date, while the details of a perception which were not clear or even considered at all at the time they were received, may be placed in their true position by analysis. In certain morbid states, for instance, delirium and mania, memories of events and even of languages which have been forgotten for many years, may be recovered. Such memories lie in depths of mind to which the term "unconscious" alone seems applicable. Constructive ideation and ratiocination appear also to proceed in the unconscious mind. Problems which have been propounded and set aside for a while receive, as it were suddenly and unexpectedly, a solution; indeed such solutions are recorded as having been reached during sleep. Similarly the execution of works of art, pictorial, musical or literary, is, especially in the case of genius, often effected without immediately preceding conscious mental effort, while the ideas of preachers, orators, wits and ordinary conversationalists often seem voiced automatically. Indeed the obtuseness of conscious effort not uncommonly mars rather than enhances the value of artistic expression. Conventionally the term "subconscious" has become restricted to those states of mind which, though not at the focus of conscious thought, can be brought to that focus at the will of the individual, but the differentiation between such states and those which are brought to consciousness only at exceptional times or by analytic methods seems to be of a very indeterminate nature. A much more particular meaning is assigned to the unconscious by some who make of it a rather sharply defined collection of primitive and instinctive infantile affects. Whatever may be the view adopted on this point, there is but little division of opinion as to the view that the affects which impel conduct, whether primitive or elaborated and sublimated, lie to a great extent in the unconscious, and the search for and examination of these affects when brought into consciousness constitute the great merit of knowledge of self. Not only does the unconscious seem to contain the powers already alluded to, but it has been sought to establish that there

is in it a something which has been termed the "censor" which seeks to prevent the emergence of unacceptable affects from the unconscious into the sub-conscious and thence into the conscious. To this "censor" is also attributed powers of transmutation of ideas and symbolization which render the crude and unpalatable operations of the unconscious less unacceptable to the conscious. The examination of dreams by the analytic method is held to have demonstrated the existence of such operations. The ideas of a given dream are one by one examined, with a view to the discovery of their associations, that is of their immediate relation with other ideas, and it is found that the manifest content of the dream is but a condensation of a much wider range of ideas and only indirectly and allegorically expressive of them. The dream is found to be the expression of an affect whose existence may perhaps not hitherto have been recognized and whose passage into the conscious has been prevented. On these points also there is not a complete consensus of opinion, and by some the analysis of dreams is held to disclose not only or so much the expression of the most primitive affects but also the ends which the individual in fact desires but of which he is but unconfessingly and dimly, if at all, aware. Indeed the interpretation of dreams seems not infrequently to depend not so much upon a thoroughgoing analysis as upon the psychological views and imagination of the interpreter.

Another method of exploration is that by free association. The patient is placed in a comfortable position and is directed to close his eyes and then to say whatever idea comes into his head, no matter how absurd or rude or otherwise offensive it may be. Ordinary volitional precautionary control being in this way relaxed, vent is given to the repressed content or at least various groupings of ideas are disclosed. Analogous results are obtained when, owing to intoxication or disease, patients reveal trains of thought remote from those to which in healthy states they give utterance, the very existence of which has been unknown to them and which when known is repulsive.

A third method of analysis is that by the "time-association" test. In this again the patient places himself in a comfortable position and relaxes his attention to what is going on or to any particular line of thought so far as is possible. He is directed to listen to certain words pronounced by the analyst, and on hearing one forthwith to say the word which first arises in his mind. The time between the signal word and the reply is noted. Normally the length of time is two to three seconds, and if it is prolonged or if after some 45 seconds no reply has been given the reaction is considered to be worthy of further examination and to indicate the existence of a group of ideas associated with a definite and perhaps marked emotional tone, that is, with a "complex," as such a group has come to be technically called. But the time element is in fact not the only one of importance in this test, since the character itself of the reply word is put to valuation. Test words may elicit replies of a rhyming character, or altogether commonplace, but on the other hand they may be so inconsequential and unexpected that a surmise at once arises that they imply the existence of a complex.

Such then are the methods adopted in analysis, and it must be plain that if carried out in detail they must necessarily occupy a considerable amount of time. Unhappily in practice analysis is apt, owing to the limitation of available time, to be slipshod, while deductions are hastily drawn from hastily gathered data; this is by so much the greater a misfortune in that the outstanding merit of analysis lies in its claim to be something of an exact method of examination and thus to supply in psychotherapy a way of discovering, and so of treating, the basis of the symptoms complained of. Though an analysis may not be thorough or the results of a thorough analysis may be incorrect, yet some amelioration of symptoms may occur, and in such an event it is possible that the process of cure is somewhat similar to that obtaining in treatment by suggestion. Though in an impartial analysis the physician should be little more than a recording machine, it is extremely difficult for him to avoid making, or at least being the occasion of, suggestions. The patient seeks a cure at the hands of one whom he regards as

having special knowledge; he is hopeful of a good result and is prepared to act upon the advice proffered. In a multitude of cases such factors seem to constitute the essentials of the cure, while the subsequent particularity of method is but of secondary importance; and however much analysis may scorn suggestion, and it does so quite ostensibly, it, like other methods, can hardly hope to escape such vitiations of its pure practice. In analysis the patient must necessarily feel a more than ordinary degree of confidence in one to whom, through a species of psychic vivisection undergone by himself, he is prepared to reveal such facts about himself as the penitent reveals only under the safeguards of the seal of confession, and indeed possibly to go further and reveal much more that is revolting and that is not present in consciousness. Such confidence in itself implies a faith which would move mountains and a mental state singularly receptive of suggestion. From deductions based upon their experience some analysts regard an examination as incomplete until and unless a sexual complex has been discovered. This probably accounts, at least in part, for the fact that the time occupied runs sometimes into years, and that even then the results are not wholly illuminating and satisfactory: while it almost certainly does account for an unfortunate persistence of thought along sexual lines which sometimes develops in patients treated by this method. It is, however, in the detailed elaboration of investigation and in the consequent establishment of unsuspected relationships between ideas and trends of thought and action that the undisputed merit of later psychological methods is to be found. Hitherto psychological examination of the normal mind has for the most part been by the subject of the subject, that is, the subject has been artificially objectified by itself; while examination of the abnormal mind has mostly been confined to the conscious superficies. Analysis has made examination both of the normal and of the abnormal a definite study of objective mental phenomena.

Many diseases in general and many functional nervous disorders and mental affections in particular get better or well by a natural process of cure, and it is difficult to distinguish among the antecedents of the process of betterment those which especially have a causal relationship with it. Some such are artificial and have been devised on various grounds,—religious, magical, philosophical and scientific,—for therapeutic purposes; but the essential difficulties in therapeutics are to determine the efficacy of such artificially introduced antecedents and whether the desired result might have been attained without them. Hence the remarkable discrepancies of opinion as to the value of modes of treatment, even when they have been originated and practised by those trained in scientific method and of ample knowledge. The frequent apparent absence of adequate physical factors in the causation of many functional nervous and mental diseases, the dualism which distinguishes between the spheres of action of mind and body, and the apparent potency of the psychic activities of one person directed upon the mental state of another, combine to justify the practice of psychotherapeutics. Nevertheless, even with a proper respect for most recent developments, it is still difficult to be sure as to which is the most successful method, or whether a combination of physico- and psychotherapeutics may not be better than either alone. It is strange to note how exceedingly exclusive the methods of therapy are apt to be. Those who perform miracles or heal by processes such as those of Christian Science claim no technical skill in medical diagnosis or any regard for it, but variation in treatment according to variation in diagnosis or at least according to the various aetiological factors discovered might be expected from the scientifically trained. Nevertheless too frequently the persuasionist, the hypnotist or the analyst apply their methods, much in the way that their precursors of long ago applied their *nostra*, with entire lack of discrimination. Perhaps lying behind their particular methods there is a common factor, one of personal influence, in which certain outstanding practitioners excel and which the remainder conspicuously lack. That there is such a factor is apparent when an ignorant practitioner is seen to be highly successful and one who is learned to be unsuccessful.

In truth, however, the nature of this influence, like so many of the antecedents of improvement in cases of functional nervous and mental disorders, is at present unknown. There must be a very considerable advance before we obtain accurate knowledge of the relative value of the many therapeutic factors that are perhaps concerned. At present treatment is largely haphazard, and improvement is ascribed to the treatment, if any, immediately preceding it; treatment which, maybe, has nothing whatever to do with the improvement that occurs.

**LITERATURE.**—The most important works on psycho-analysis are four by S. Freud, the most prominent investigator of the subject, translated for English readers by Brill: *Collected Papers on Hysteria* (1912), *The Interpretation of Dreams* (1913), *The Psychopathology of Everyday Life* (1914) and *Three Contributions to the Theory of Sex* (1918). Brill has given a good account of these in his *Psycho-analysis*. Jung's deviation from Freud's position is set forth in *Collected Papers on Analytical Psychology*, edited by Constance E. Long (1917). *Dream Psychology* by M. Nicoll (1920) expounds an interpretation of dreams of a less sexual character than that given by Freud. P. Janet criticised the methods and findings of psycho-analysis in his report to the 17th International Congress of Medicine (*Proceedings of the Congress*, Sect. 12, pt. 1, p. 13). This criticism is somewhat elaborated in Janet's *Les Médications Psychologiques* (1919). On hypnotism the following works are good and ample: J. M. Bramwell, *Hypnotism* (1913); A. Forel, *Hypnotisme* (tr. by H. W. Armit 1906); C. Lloyd Tuckey, *Treatment by Hypnotism and Suggestion* (7th ed. 1921). On persuasion the following may be recommended: Paul Dubois, *De l'Influence de l'Esprit sur le Corps* (Engl. tr. 1910) and *L'Éducation de Soi-même* (Eng. tr. 1911); J. Camus and P. Parniez, *Isoléisme et Psychothérapie* (1904); J. Déjérine and E. Gauckler, *Psychométries* (1911). A book from a distinctively Christian point of view is the *Spiritual Director and Physician* by Rev. V. Raymond, tr. by Dom Aloysius Smith (1914). (E. D. M.)

**PUBLIC ASSISTANCE.**—A marked feature in the social-economic history of the 20th century, and one which became even more marked in its second decade, has been the growth in public expenditure in relief of private wants. "Public Assistance" is of two kinds, direct and indirect. Direct public assistance is the receipt of any benefit in money or in kind at the expense of the rates or taxes which is wholly or partly unpaid for by the recipient. Direct public assistance includes objects like old-age pensions, unemployed benefit, children's meals and medical assistance. Indirect public assistance includes cheap baths and wash-houses, main drainage, cheap railway tickets, sanitary inspection and regulation generally, the control and maintenance of water supply and roads. It is with direct public assistance only that this article deals.

In the form of general dōles, public assistance has always exercised a most disastrous influence on the countries where it prevailed. In the ancient world the State was founded on slavery and the citizens were a minority. In Athens the payment of citizens for attendance at the public assemblies and religious ceremonies known as the theoric fund, exercised a corrupting influence on the democracy from the time of Pericles, and Aristotle lays down the general proposition: "Demagogues distribute surplus revenue to the poor. These receive them and are again in want. For such help to the poor is like 'the cask with holes in it.'" The free distribution of corn at Rome had the same results. At first it was sold cheap to the poor in 121 B.C.; then in 58 B.C. it was made free. At first only one-eighth of the citizens took part in the distribution, but within little more than a decade the proportion had increased six-fold, and the number reached 320,000. Caesar reduced the number to 150,000, but in Augustus' time it rose again, and the rise continued till as Gibbon relates "in the age which preceded the fall of the Republic only 2,000 citizens were possessed of an independent substance." When the imperial granaries, namely Sicily and Carthage, were lost, the wretched people, by this time quite destitute of self-help and self-reliance, were thrown back upon voluntary charity and the Church.

**GREAT BRITAIN.**—In modern times England has been the "classic land" for State-regulated public assistance. The system dates from 1601, the 43rd year of the reign of Elizabeth. During the Middle Ages the poorer classes depended on the feudal chiefs and the Church. As the feudal system decayed the poor fell back on the ecclesiastical foundations, and in the oft-quoted

words of Fuller, the abbey "dispensed mistaken charity, promiscuously entertaining some who did and many who did not desire it: yea these abbey did but support the poor whom they themselves had made." With the dissolution of these abbey these poor people were thrown back on the State, and under the Statute of Elizabeth, which lasted unimpaired till 1834 and in 1921 was still the basis of the Poor Law, a compulsory assessment was made "for the relief of the impotent and the setting of the able-bodied to work." (See under CHARITY and CHARITIES, 5,880 seq.)

The administration of the Poor Law proceeded for 230 years with variations of leniency and severity till 1785, when a period of excessive expenditure set in, which in some cases swallowed up the whole of the annual rateable value of the land and reduced the nation to the verge of bankruptcy, leaving the population in a state of complete demoralization. In 20 years from 1783 the Poor Law expenditure had more than doubled itself, and in 1817 it had reached the enormous total of £7,871,811 for a population of about 11,000,000. In 1832 a Royal Commission was appointed which conducted a thorough inquiry and collected striking evidence on the moral deterioration. It appeared from the evidence that the change made in the character and habits of the poor by once receiving public relief is quite remarkable. They are demoralized ever afterwards. "The disease is hereditary," it was contended, "and when once a family has applied for relief they are pressed down for ever." The receipt of relief by a man has been compared in its results to the loss of virtue in a woman. They are never the same again. The Commissioners state that pauperism seems to be an engine for the purpose of disconnecting each member of the family from all others: of reducing all to the state of domesticated animals fed, lodged and provided for by the parish without mutual dependence or mutual interest.

The Commissioners showed that the bulk of the abuses and evils disclosed were the direct result of indiscriminate outdoor relief. They laid down the principles: (1) that the pauper's condition shall be less eligible than that of the independent labourer of the lowest class who has to bear the charge; (2) that the function of the State should be limited to the relief of destitution, such destitution to be tested by the willingness to enter a workhouse or institution; (3) that remedial relief as opposed to the relief of destitution should be left to voluntary charity. The main truth is that in all public relief there must be an element of deterrence and some check or test to prevent general pauperism.

On these principles the new Poor Law, the administration of which was handed over to the Commissioners, was based, and it was exercised with such efficiency that in 1871 with a population of 22,500,000 the cost was almost exactly the same as in 1817 with a population of 11,000,000; in other words the cost of pauperism per head of the population had sunk from 14s. to 7s. Between 1873 and 1883 the percentage of those in receipt of direct public assistance was slightly over 3% of the population, the lowest point reached being 2.9 in 1878 and 1879. In the meanwhile the working-classes had not only recovered their self-respect and self-reliance but had through their own organization, the trade unions, the friendly societies, the coöperative societies and the building societies, provided a complete answer to all the difficulties of the Labour problem. In these trade unions and friendly societies they themselves without help from the State had elaborated methods by which provision was made for sickness, accident and old age. Their coöperative societies provided them with the necessaries of life of excellent quality at little over cost price; their building societies provided them with the means to acquire their own houses. At the beginning of the 'nineties a complete survey of the whole problem was taken by the Royal Commission on Labour, and it appeared that the income of 542 trade unions was £1,790,000 and the membership 1,080,000. There were 29,742 friendly societies with a membership of 8,320,262 and funds of more than £26,000,000; also 1,624 coöperative societies with 1,119,000 members and £17,000,000 capital; the sale of foods amounted to £48,500,000 and the profits to £4,774,000; while the assets of the building societies

(£50,700,000) brought the total capital funds traceable to the working-classes up to between £90,000,000 and £100,000,000, quite apart from their deposits in savings banks, etc., which a competent authority estimated at another £160,000,000 at the very least. So different was the position that Mr. Ludlow (the chief registrar of the friendly societies) could say in his evidence before the Commission: "Now the black spots in the country may I think almost be counted on the fingers. In former days it was very nearly black, with but few white spots." This wonderful development of self-help embraced all skilled labour and was gradually taking hold of the unskilled, giving the English working-man a knowledge of business and a training in self-government such as the working-man in no other non-English speaking country possessed in anything like the same degree, if at all.

The serpent however was in the grass. The politicians saw capital in the working-man as a voter. In 1886 the first breach was made in the Poor Law system by the institution of municipal distress committees which withdrew the unemployed to a certain extent from the workhouse test. In 1890 the fees for elementary education were remitted, that the poor might have more where-with to pay for the food and clothing of their children, but it was not till the beginning of the 20th century that, to use Aristotle's expression, more holes were made in the cask. In 1905 the Unemployed Workmen's Act was passed. In 1906 the Children's Meals Provision Act was passed, in 1907 the Administrative Provisions Act, in 1908 Old Age Pensions were adopted and in 1911 the system of National Health Insurance was introduced with its famous bribe of "9d. for 4d." By 1913 it was no longer possible to form any idea of what proportion of the population was living on its exertions and what was depending on public subsidy, or what was the administrative cost. In January of that year therefore, the writer, with the support of friends on both sides of politics, began to ask for a return which would give the facts and figures. In 1919 the fourth edition of that return was published, and later information enables the following picture to be given in 1921.

In 1890 the expenditure on public assistance from rates and taxes was £25,000,000, in 1901 £40,000,000, in 1911 £68,800,000, in 1919 £172,800,000 according to a return which includes figures as old as 1916 (No. 160, 1920), and for the year ending March 31 1921 no less than £332,000,000 (including war pensions) as far as can be gathered from statements in Parliament. The beneficiaries from the last-mentioned return appear to number not fewer than 28,000,000 out of a population which cannot be put higher than 48,000,000. In other words 58% of the population in 1921 were receiving help from public funds, at a rate of about £6 11s. per head, as compared with 4.6% at a rate of 7s. per head in 1871.

With regard to the total of 28,000,000, on the one hand there is, as will be seen, a great deal of fraud and overlapping which may tend to reduce the number, but on the other hand there are a great many gaps in the figures of the return, the figures relating to the National Insurance Unemployment Act being given at 58,000—much too few for the year ending March 31 1921.

We must now say a few words as to some of the holes in the cask, and on the means, if any, of regulating the money poured in or stopping the leaks.

The principal British Acts concerned are (1) the Education Act with the Provision of Meals Acts, etc.; (2) the Old Age Pension Acts; (3) the National Health Insurance Acts; (4) the Public Health Act, (a) as to hospitals and treatment of disease, (b) as to maternity and child welfare; (5) War Pensions and Ministry of Pensions Acts; (6) Housing of the Working Class Acts; (7) Acts relating to the relief of the poor; (8) Unemployed Workmen's Act; (9) Unemployed Insurance Act. No account is here taken of the bread, coal and railway subsidies, which amounted in 1920-1 to about £87,000,000; they are omitted because they affected the whole population and were temporary.

The Education Act would not at first sight seem to fall under the heading of public assistance, but educationists take an entirely new view of their work to that of other days. "Formerly," says an education report of the London County Council in 1910.

"education was in the main confined (1) to the growth of character, (2) to the growth of the mind. Now it looks increasingly at the social problems which present themselves for solution in the case of the individual child, the problem of physical deterioration, of under-feeding, of impoverished homes and unsuitable employment." In regard to necessitous children, the same authority remarks: "Necessitous children are not necessarily ill-nourished at the time of application, though they would become so if relief were withheld." Not a word is said about the duties of the parent. The same is true of the Public Health Acts, the administrators of which do not consider the character of the individual, but solely the health point of view.

With regard to the vast expenditure under the Education Acts, the select committee on national expenditure reported in Dec. 1918 that they had been impressed by the atmosphere of financial laxity in which questions involving education are apt to be considered, and state that under the Act of 1918 neither Parliament nor the Board of Education nor the local authorities can control education.

With regard to the Old Age Pensions Acts which were to diminish Poor Law expenditure and empty the workhouses, the minister who introduced the proposal in 1908 stated that no Chancellor of the Exchequer in his senses would think of adding £3,000,000 to the sum of £6,000,000 which he proposed. In 1921 the amount voted was £28,000,000, and a proposal to add £15,000,000 thereto was only defeated by a majority of 12, the proposer stating that this was but an instalment and that he was in favour of raising the amount of the pension from 10s. to 20s. and reducing the pensionable age from 70 to 60. As to the administration of those Acts it is noteworthy that Ireland with a pop. of 4,390,000 drew £3,320,000 for 181,000 pensioners, while Scotland with a pop. of 4,760,900 drew £1,664,000 for 90,000 pensioners. This looks as if there was a leak somewhere.

Old-age pensioners have from the first received medical relief from the Poor Law, and now, if necessitous, are entitled to receive other relief as well. The separation of the local administration from that of the Poor Law for political reasons has had unsatisfactory results, apart from the extra expense.

With regard to the administration of the National Health Insurance Act, Sir Arthur Newsholme, a well-known authority, has stated that "the system is not actuarially, financially or medically sound, and has involved expenditures in administration entirely incommensurate with the benefit received."

The overlapping of the insurance system with the Poor Law has involved endless difficulties, and it appears from the Return No. 160 (1920) that the annual expenditure for the year given (1919 is the latest available) was £4,294,000 out of a total expenditure of £20,311,000. It was stated as long ago as 1912 that overcoats, underclothing and food were given under sanatorium benefit, thus relieving public health and Poor Law funds, and sanatorium benefit was only a rechristened form of outdoor relief. As to the Poor Law, it may be observed in passing that its expense increased between the years 1911 and 1919 from £15,000,000 to £18,000,000 for England and Wales alone, and as old-age pensioners left the workhouse their places were filled by those under 70 years of age.

With regard to the unemployed insurance it appears that the reserve of £20,000,000 which existed after the World War was exhausted by June 1921, and that the Treasury was drawn upon for another £10,000,000, while as to the unemployed dole the magistrate at the Thames police court on May 13 1921 said: "It has been said from this bench over and over again that such doles lend themselves to and almost induce fraud."

All that can be said with certainty as to the national housing scheme is that the losses to the central and local Government on each house annually will amount to an enormous sum. Originally 1,000,000 houses were to be built. In May 1921 the annual loss to the State on each house was placed officially at £60 apart from loss to the rates. This makes an annual loss of about £18,000,000, or a total eventual loss at the end of 60 years of £700,000,000. Thus a privileged class of house-holders will be created at an enormous loss.

The attitude of Parliament to such expenditure gives little hope of a check from that quarter. There is a constant complaint of the apathy and slight attendance at debates on economy, and the late Speaker of the House of Commons pointed out that since 1900 there has been a great change in the attitude of the House towards economy and that now the advocates of economy "do not get a look in." The Chancellor of the Exchequer frankly said in March 1920 that with such items as old-age pensions, a national unemployment scheme and a national housing scheme, it was impossible to offer a blunt uncompromising refusal to proposals for new expenditure.

With regard to the central authority, economy is unlikely from that direction, for enormous increases have been made either in the shape of additional salary or temporary bonus by Whitley Councils consisting of civil servants to the lower grades and by the Government to the higher grades (including the Treasury), which in both cases, without previous knowledge or sanction of Parliament, the central authority has by circular invited local authorities to follow, and the central authority has a means in the Exchequer grants (which it can give or withhold at will) for stirring up the local authority to spend money.

On the whole then, there seem few weapons in the hands of those who would stop the progress of a democratic nation on the road to ruin. But they comprise, first, a complete statement of accounts showing how the money is raised, how it is spent, what is the administrative cost and who are the beneficiaries, whether worthy or unworthy. Secondly, the institution of a strong but small central commission, as in 1832, to ration the administration of the whole of the new system of public assistance, taking care not only to punish fraud and put down overlapping but also to make the position of the beneficiaries (apart from war pensioners) less eligible than that of the lowest class of independent workmen, and introduce some stringent and deterrent test. Lastly, to make it clear that all this vast expenditure from the rates and taxes, however carefully disguised, falls in the long run most heavily on the working-classes, by wasting the fund from which come new enterprises and increased wages on myriads of officials who make the poor man's life a burden to him.

(G. DR.)

UNITED STATES.—Owing to the fact that the United States is still a new country with a comparatively small number of poor, the need in its communities for public assistance in the relief of poverty and attendant ills has been much less urgent than in European countries. One consequence is that the "right to relief" has been recognized in the laws of only a few of the states. That every man ought to support himself and his family is, or has been, the working social theory of Americans of all classes. They have looked with disfavour on continued subsidies and other payments which might seem to be part of a routine, preferring to provide temporary assistance when necessary, treating each case as an emergency, in the expectation that the beneficiary will soon be able to shift for himself. They have declined to recognize formally the existence of a necessitous class. Hence much of the relief work in the United States up to 1921 was still done by privately supported agencies.

In the decade 1910-20 it became obvious, however, that a change had begun. Americans seemed to be losing their aversion to paternalistic government, and the newer proposals for social betterment tended to call for some kind of legislation involving an extension of state or municipal activity and for an appropriation. Among the more progressive states and cities it became the rule to establish departments of public welfare, which, though their duties and perhaps their theories were somewhat vague, nevertheless made incessant demands for further appropriations and for fresh welfare legislation. It is characteristic of the American point of view, however, that this welfare movement concerned itself less with the lowest forms of poverty or with the most helpless layer of the dependent than with improving the conditions of life among wage-earners in general.

The tendency to extend the range of Government activity in welfare work did not escape serious criticism. This criticism was perhaps most emphatic with respect to the ever-widening

scope of the work undertaken by public health departments. The point was made that in so far as these bodies exceeded the limit of indispensable activities they were "pauperizing" the public. The accepted view was that the duty of sanitary authorities was not to help any one family to be healthy, but to prevent any one family from disseminating disease. But it is almost impossible to draw a line between necessary functions and those which are largely philanthropic. Thus many cities maintained a large staff of physicians and nurses whose duty it was to visit schools and even households, giving advice and treatment free. From the private practitioner's point of view this work was an encroachment on his legitimate sources of income, but free medical treatment in the case of school-children, for example, is merely an incident of free education, for the ability to receive education is in large degree dependent on physical fitness. It should be said, moreover, that in most cities free treatment was not given unless the recipient was unable to pay, and that in any case the community was only protecting itself by promoting the health of its individual members. The same question was involved in the establishment of sanatoriums in many parts of the United States for the treatment of tuberculosis and other communicable diseases, both aiding the sufferer and safeguarding the public from him, as had been done in the case of the insane for many years. In some of such institutions a nominal charge was made, but by far the greater part of the expense was paid by taxation. Hospitalization came to be expected as a right, regardless of the ability of the patient to pay the cost of treatment. Thus the American public was being taught to feel that the state or county or city was bound to provide certain kinds of public assistance which had been regarded as outside the scope of state subsidies.

Of the newer proposals for public assistance none gained more rapid headway than that for mothers' allowances or pensions. The first such law was passed by Missouri in 1911, and granted allowances to widows with children and to deserted mothers; by 1920 there were similar provisions in 39 states. These allowances ranged from \$2 a week for each child up to \$25 a month for the first child and \$15 a month for each additional child. The age limit, after which the allowance was to cease, was placed at 13 years in some states and as high as 18 in others. Up to 1920 the aggregate of these allowances had not become so large as to alarm taxpayers, and in so far as the system saved the children from being committed to public institutions— orphan asylums and the like—it was undoubtedly beneficial. Legislation for mothers' allowances, no doubt, tends to create a demand for old-age pensions, but up to 1921 no state had yet undertaken this form of subsidy. Taxes for mothers' allowances were mostly levied and administered by the county governments.

Another form of public assistance which grew rapidly in the decade 1910-20 was that connected with the health of children, particularly those attending school. As early as 1892 New York City provided for the inspection by health officers of school-children, and by 1920 practically every city had organized some form of health examination for all pupils attending public schools. In later years the scope of the work was considerably expanded; skilled medical examiners were employed to give especial attention to eyes, throats and teeth, and, where necessary, treatment was often given at public expense. Special open-air schools were opened in many places for tubercular children; and proper conditions maintained for giving the children adequate fresh air, rest and nourishment. In many poorer districts, where the educational progress of the children was found to be retarded by under-nourishment, it became customary for the school authorities to provide a daily luncheon, which was served either free or at a nominal price. In 1919 cities having each a pop. of more than 30,000 expended an aggregate of \$1,849,624 on medical work for school-children, and an additional amount of \$908,742 on other child conservation work, such as the employment of trained nurses to visit mothers in congested districts and the establishment of infant welfare stations where mothers could obtain medical advice and free treatment for their babies.

To determine the aggregate amount of public assistance in the United States it is necessary to state that such items as those for sanitation, prevention of epidemics, protection to life and property cannot properly be regarded as public assistance. The following tables, based on U. S. Census Bureau reports, show the increase in public expenditures in the period 1913-9 for health conservation and maintenance of charities, hospitals and correctional institutions:—

## HEALTH CONSERVATION

Expended by	1919	1913
States	\$12,249,333 (1918)	\$ 6,388,114
Counties	5,000,000 (est.)	2,815,466
Cities	20,208,615	12,000,000 (est.)
Total	\$37,457,948	\$21,203,580

## CHARITIES, HOSPITALS AND CORRECTIONS

States	\$118,084,025 (1918)	\$ 87,585,903
Counties	60,000,000 (est.)	37,815,508
Cities	55,086,145	32,896,351
Total	\$233,170,170	\$158,297,762
Grand total	\$270,628,118	\$179,501,342

Thus the increase in expenditures for the purposes noted was somewhat more than \$90,000,000 in six years. These figures, however, include the cost of certain activities which cannot rightly be classed as public assistance, and which are approximately one-third of the total. With respect to the more recent compilations of the Census Bureau, it is possible, because of the greater fullness of data, to exclude those items. Thus a tabulation of the expenditures by the states for public assistance in 1918 would include the following:—

## HEALTH CONSERVATION.

Treatment of tuberculosis—	
In institutions	\$5,105,556
Elsewhere	643,981
Treatment of other communicable diseases	1,488,186
Conservation of child life	285,674
Other health activities	764,497
CHARITIES AND HOSPITALS.	

Supervision	849,727
Outdoor relief	517,827
Care of poor—	
In state institutions	121,995
Elsewhere	121,101
Care of children—	
In state institutions	1,328,441
Elsewhere	2,023,205
Care of blind, deaf and mute—	
In state institutions	4,458,758
Elsewhere	1,713,274
Other charities—	
State institutions	8,924,208
All other	530,862
Hospitals—	
General	2,613,951
All other	3,149,100
Hospitals for the insane—	
State	47,866,528
All other	2,091,304
Total	884,682,175

The expenditures of cities for similar purposes in 1919 were as follows:

Prevention and treatment of communicable diseases—	
Tuberculosis	\$5,145,280
Other communicable diseases in hospitals	4,427,510
Other treatment	2,271,364
Conservation of child life—	
Medical work for school-children	1,849,624
Other child conservation work	908,742
Charities and hospitals—	
General supervision	854,466
Outdoor poor relief	4,631,607
Poor in institutions	7,715,940
Care of children	7,125,436
Other charities	3,570,051
General hospitals	16,735,615
Insane hospitals	3,871,082
Welfare commissions	47,307
Total	\$59,154,114

With respect to conservation of health, items representing general administrative expenses have not been included in the two preceding tables, although a certain percentage of these undoubtedly belongs under the heading "public assistance." Whatever their amount may be it is offset by the unavoidable inclusion of certain expenditures for preventive health measures, most of which are undertaken for the benefit of the community at large rather than with the definite purpose of aiding needy persons. Detailed figures showing the expenditure of counties were not available, and it is possible that if the aggregate expenditure for mothers' allowances were known, it would materially increase the totals given in this article.

The available data indicate that, exclusive of Federal provision for former soldiers and their families, and for other agencies for dependents which come under the jurisdiction of the Federal Government, the total expenditure for public assistance in the United States in 1920 was more than \$200,000,000, the appropriations originating as follows: states, \$90,000,000; counties, \$45,000,000; and cities, \$65,000,000. It seemed probable that these appropriations would rapidly increase as the more recent projects for public assistance became more fully developed and as the economic reaction following the World War spent itself.

(F. H. H.)

**PUBLIC TRUSTEE** (see 27.334).—The Office of the Public Trustee, created in Great Britain by the Public Trustee Act 1906, was opened at Clement's Inn, London, on Oct. 1 1907, under Sir Charles John Stewart, K.B.E. (1918), who organized and controlled the Department during a period of rapid growth until his retirement in 1919. He was succeeded in office by Mr. Oswald Richard Arthur Simpkin, to whom fell the equally difficult task of post-war reorganization. The other principal officers of the Department in 1921 were Mr. Ernest King Allen, Assistant Public Trustee (at Kingsway), and Mr. Thomas Moffat Young, Deputy Public Trustee, at Manchester. The staff in 1921 numbered 874 in London and 86 at Manchester.

The number of trusts and estates accepted for administration by the Public Trustee in the first year (1907-8) was 63, valued at £384,000. In 1913-4 the acceptances were 1,573 cases valued at £13,500,000, and at the end of that period the Office was administering 5,480 cases, representing a value of £43,500,000, and had distributed 450 cases and £5,834,691 of trust funds. Meanwhile the staff had grown in number from 19 to 370, the annual fee income from £502 to £55,283, and the expenses from £3,312 to £49,428. On April 1 1914 a Northern Branch of the Department was opened at Manchester (Northern Assurance Buildings, Albert Square) under a Deputy Public Trustee, and following on the Report of the Royal Commission on the Civil Service the Public Trustee's staff was made a part of the permanent Civil Service.

The outbreak of the World War found the Department manned almost entirely by officials of military age, and probably no Government Office suffered so much from the transfer of members of its staff to the fighting services. During the greater part of the war period most of its work had to be done by women clerks and by such temporary men as could be recruited under the existing conditions. In Sept. 1914 new and onerous duties were laid upon the Public Trustee by his appointment under the Trading with the Enemy Act and Proclamation as Custodian for England and Wales of enemy property. The Act provided that all sums payable to enemies by way of interest, dividends or share of profits should be paid over to the Custodian; that firms with enemy partners and companies with enemy shareholders should make returns to the Custodian disclosing such enemy interests, and that all persons holding or managing property on account of enemies should give particulars to the Custodian. Under the Patents and Designs Act 1907, the Public Trustee was also appointed to receive royalties in respect of patents avoided or suspended under the Patents, etc., Temporary Rules Act 1914. A separate "Trading with the Enemy" Branch was opened at 2, Clement's Inn on Nov. 30 1914. Further legislation in 1915, 1916 and 1917, and also the Peace Treaty, threw additional duties upon it, and in 1921 it employed a special

staff of 327 persons at Kingsway and Cornwall House. The fees collected by the Public Trustee as Custodian from 1914 to 1921 amounted to £412,000.

In 1915 the Public Trustee Office was removed from Clement's Inn to new Government buildings in Kingsway, Sardinia Street, and Lincoln's Inn Fields, but the continued growth of the work and staff made it necessary to invade the adjoining buildings, Queen's House and Victory House.

The progress made during and after the war is indicated by the following table:—

Cases Accepted	Value	Fees	Expenses
1914-15 . . . 1,543	£11,624,000	£65,390	£61,632
1915-16 . . . 1,595	16,622,000	74,762	72,171
1916-17 . . . 1,811	16,544,000	95,238	98,330
1917-18 . . . 1,876	17,862,000	107,139	130,457
1918-19 . . . 1,767	17,192,000	119,619	175,581
1919-20 . . . 1,950	21,864,000	148,756	241,787
1920-21 . . . 1,559	15,682,492	283,499	398,389
Total since Oct. 1 1907	18,039	1,074,109	1,345,652

Two facts stand out conspicuously from this record. The first is the large business annually brought to the Department by a "voluntary" public and the very large number and value of the estates under the Public Trustee's care. The second is that whereas the Department was apparently self-supporting from 1907 to 1916, after 1916 the fees earned under the Public Trustee Act were insufficient by an increasing margin to cover the cost of the work done under that Act. The explanation in a nutshell is that the scale of fees which was in force until April 1920 was nicely calculated to cover (without a profit) the cost of staffing, housing and working the Department under the conditions which existed before the war, with a non-pensionable staff of young men who were content to look to the future of a rapidly growing office, rather than to the immediate present, for adequate pay. Such a scale of fees was bound to prove too low when the Department had to pay (in part) the salaries of an absent staff as well as those of their temporary substitutes, to make provision for pensions, to meet the charges for larger and more expensive buildings, completely to reorganize its personnel after the war on an entirely new basis of salary values, and finally to conform with the new and much more generous treatment of Civil Servants in the matter of base salaries and "cost-of-living" bonus which followed the institution of Whitley Councils in the public service.

On the retirement of Sir Charles Stewart the Lord Chancellor appointed in April 1919 a strong Committee, with Sir George Murray, G.C.B., as chairman, to review the whole position of the Department and to report upon questions of staffing, pay, policy, decentralization and fees, and it did so in Nov. 1919. With one dissentient the Committee approved the general lines on which the office had hitherto been conducted and recommended as a basic policy that "trust estates should, while retaining the service of outside agencies, secure the further advantages afforded by a Public Department having at its disposal within its own walls independent experts capable of criticizing and possibly correcting or supplementing the advice received through the ordinary channels available to the private trustee." The Committee recommended the modification and strengthening of the internal organization in certain respects, and in order to restore the financial equilibrium, upset by the war, suggested a new scale of fees calculated to increase the income of the Department by about £120,000 a year. With regard to branch offices, the Committee recognized the successful and economical management of the Manchester office and approved the principle of decentralization, but hesitated to recommend further experiments in this direction "until the possible deterrent effect of the increased fees on new business has been ascertained." Mr. S. Garrett in his Minority Report advocated a restricted service and somewhat lower charges, and doubted whether "business would be obtained in the provinces at the fees proposed by the Majority Report." The Majority Report was accepted by the Lord Chancellor, and the new scale of fees became operative on April 1 1920.

The increase of fees was still too recent in 1921 for its effects to be accurately measured, and the calculations upon which it was framed had already been to some extent upset by unforeseen circumstances. It remained to be seen whether Civil Service conditions strictly applied to a Department which, like the postal, telegraph and telephone services, was essentially a business undertaking, but unlike them was not a monopoly, were compatible with commercial success in a field open to competition. The competitors of the Public Trustee are (a) banks, insurance companies and other corporate trustees, and (b) solicitors, who are the active managers of thousands of trusts and estates nominally administered by others. If the Public Trustee's charges were to rise beyond a certain level his services would not be sought, and his competitors, who as employers are entirely untrammelled, would be greatly stimulated and assisted. In 1921 there was as yet no indication that this level had been reached, and those who resorted to the Department had at any rate the satisfaction of

knowing that the Public Trustee's fees, if and when they showed a commercial profit, would be reduced.

On the administrative side the Public Trustee Office may be regarded as an established success and an institution of great public utility in protecting beneficiaries against the loss of trust funds through incompetence and dishonesty. Its work has been brought up to a high standard of efficiency, and the system of organization under which every trust is administered by an individual trust officer, who is personally responsible for its proper conduct, disarms the criticism that the functions of a private trustee cannot be performed by a department of the State. Another fear, viz. that the aggregation of a vast body of investments under the control of a single official might be a public danger, has found no justification in experience. Although the Public Trustee is responsible for investments of one kind and another (apart from "enemy" property) of a nominal value exceeding (in 1921) £143,000,000, they are in fact so multitudinous in character, represented by so many separate earmarked holdings, governed by so many different trust instruments, and in so many cases controlled jointly by co-trustees, that it would be impossible to deal with them *en masse*. As a further safeguard the Public Trustee, from 1914 onwards, has enjoyed the advantage of the counsel of an Investment Advisory Committee composed of representatives of finance in the City of London; in 1921 it consisted of the Rt. Hon. Frederick Huth Jackson, Mr. R. Martin-Holland, C.B., Sir R. M. Kildersley, G.B.E., and Mr. J. A. Mullens, Junr. This Committee meets monthly to review and discuss with the Public Trustee all investments and sales for reinvestment made by him.

*Public Trustee in Other Countries.*—The first country to possess a Public Trustee was New Zealand (1872), and the Public Trustee of New Zealand had in 1921 offices at Auckland, Christchurch, Dunedin and Wellington. In Australia there are Public Trustees at Sydney (N.S.W.), Adelaide (S.A.), and Hobart (Tasmania), and Public Curators (with similar functions) at Melbourne (Victoria), and Brisbane (Queensland). In Canada there is a Public Trustee at Toronto. In India and Burma there are Administrators-General and Official Trustees (offices at Allahabad, Bombay, Calcutta, Madras and Rangoon) who have some of the functions of the Public Trustee in England. Ireland has a Public Trustee (at Dublin), who receives only purchase moneys paid under the Irish Land Acts.

**PUCCINI, GIACOMO** (1858– ), Italian composer (see 22,632). His recent works include *La Fanciulla del West* (The Girl of the Golden West, 1910); *Le Rondine* (1916); *Il Tabarro*, *Suor Angelica*, and *Gianni Schicchi* (1918).

**PULITZER, JOSEPH** (1847–1911), American editor and newspaper proprietor, was born in Budapest, Hungary, April 10 1847. He came to America in 1864, entered the Union Army, and served to the end of the Civil War. In 1868 he became a reporter on the *Westliche Post*, a German newspaper in St. Louis, and in 1871 managing editor and part owner. In 1869 he was elected to the Missouri House of Representatives; in 1872 was a delegate to the Liberal Republican National Convention which nominated Horace Greeley for president; and in 1874 was a member of the Missouri Constitutional Convention. In 1876–7, during the Hayes-Tilden controversy, he was in Washington, D.C., as correspondent for the New York Sun. In 1878 he purchased the St. Louis *Evening Dispatch* and *Evening Post*, combining them as *Post-Dispatch*. In 1880 he was a delegate to the National Democratic Convention. In 1883 he bought from Jay Gould the New York *World* (see 19,569), which fearlessly attacked political corruption. In 1884 he was elected Democratic member of Congress from the state of New York, but resigned after serving a few months. In 1896 he allied himself with the "Gold" Democrats and opposed the nomination of William Jennings Bryan. During his later years he was blind and spent much of his time cruising about the world in his yacht, but to the end continued to direct his New York paper. He died on board his yacht in Charleston harbour, S.C., Oct. 29 1911. Interested in improving the profession of journalism, he worked out a plan for establishing a school for training journalists. In 1903 he set aside \$1,000,000 for establishing a school of journalism at Columbia University. His own idea as to the object of such a school is set forth in an article, "The College of Journalism," contributed to the *North American Review* for May 1904. In Sept. 1912 the School of Journalism of Columbia was opened. He left \$500,000 each to the New York Philharmonic Society and the Metropolitan Museum of Art.

His son, RALPH PULITZER (b. 1879), succeeded him in control of his newspaper properties. He married (1905) Miss Frederica Vanderbilt Webb of New York City.

**PUTNIK, RADOMIR** (1847–1917), Serbian general, was born on Jan. 25 1847 at Kraguyevats. Like many other prominent figures in the life of his country, he came of a family which had emigrated to the Banat during the Turkish conquest and returned to Serbia after the expulsion of the Turks. Passing through the artillery school (which afterwards became the Serbian military academy), he obtained his commission in a line regiment. In 1876 he commanded a brigade in the war against Turkey, and when war was renewed in 1877 became chief-of-staff of the Shumaja Division. In the Serbo-Bulgarian War of 1885 he held a similar post in the Danubian Division, and in 1889 was made deputy-chief of the general staff, and taught as professor at the military academy in Belgrade. Like many other brilliant officers, he suffered from the favouritism which Kings Milan and Alexander had introduced into the Serbian army and from the consequent atmosphere of intrigue and personal rivalry. He was placed on the retired list, and it was only after the military revolution which destroyed the Obrenović dynasty in 1903 that he obtained his real opportunity of service. In that autumn he was appointed general and chief of the general staff. In 1906 he succeeded Gen. Gruić as Minister of War, and again held that office in 1912, during the decisive period when the military convention with Bulgaria was being negotiated. On the outbreak of war with Turkey he was made *voivode* or marshal (being the first holder of that title) and commander-in-chief, and was responsible for the rapid success of the Serbian arms at Kumonovo, Prilep and Monastir. It was largely owing to his vigilance and foresight that the treacherous night attack by which the Bulgarians opened the second Balkan War (June 29 1913) was so complete a failure. In the preceding months of suspense he and his staff had worked out a careful plan of action, and when Gen. Savov on July 1 gave his amazing order for the cessation of hostilities, Putnik was able to launch a counter-offensive, which resulted in the long-drawn-out battle of the Bregalnitsa and the final retreat of the Bulgarians. When the World War broke out he was undergoing a cure at an Austrian watering place—a very practical proof that the Serbian High Command was not preparing for an armed conflict. At first placed under arrest, he was released by special order of the Emperor Francis Joseph and conveyed to the Rumanian frontier. His impaired health did not prevent him from resuming the position of Serbian generalissimo and organizing the resistance of the country to invasion; and he inflicted upon the forces of Gen. Potiorek three successive defeats—the battles of the Vadar (Aug. 16–20), of the Drina (Sept. 8–19) and of Rudnik, which ended on Dec. 14 1914 with an Austrian rout and the complete evacuation of Serbia. On the latter occasion Putnik's success was rendered definitive by the genius of Gen. Mišić, the commander of the I. Army. Putnik retained the supreme command during the triple invasion of Serbia by the German, Austro-Hungarian and Bulgarian armies in Nov. 1915, and shared the retreat of the Serbs through Albania. When, however, the exiled Government established itself at Corfu, he and most of his staff were placed on the retired list. He himself withdrew to France. He died on May 17 1917 at Nice.

**PUTUMAYO**, or ICA (see 1,788), one of the larger tributaries of the Upper Amazon, rising in Ecuador in the Cordillera of the Andes, near Pasto, flowing in a S.E. direction and joining the Amazon at a point somewhat S. of lat. 4° S. The middle reaches of the river are also known as the Caquetá, the lower reaches being called the Caquetá or Yadurá. The Putumayo, which gives its name to the whole region through which it flows—a wilderness of tropical forest of which the sovereignty has been long in dispute between the republics of Peru, Ecuador and Colombia—obtained an evil notoriety in 1912 after the publication by the British Government of the Blue Book containing the evidence, collected by Mr. (afterwards Sir Roger) Casement, of the atrocious methods employed in this district by the agents of the Anglo-Peruvian Amazon Rubber Co. in order to force the natives to collect rubber. These crimes, which recalled those of the Congo and covered the whole gamut of hideous atrocity (there were some too horrible to publish

even in the Blue Book), were first denounced in *La Felpa* and *La Sancion*, papers published at Iquitos, in 1907, shortly before the Peruvian firm of Arana Brothers—who had exploited this territory since 1806—was merged in the Anglo-Peruvian Co., with its headquarters in London. It was not, however, till 1909 that the attention of the British Government was directed to this matter by the revelations of Mr. Hardenburger, an American traveller, in the British periodical *Truth*. Since certain British subjects, negroes from Barbadoes, were implicated in these charges, Mr. Casement, then British consul-general at Rio de Janeiro, was commissioned in 1910 to proceed to Iquitos and the Putumayo and institute inquiries on the spot.

As a result of the report submitted by him a Select Committee of the House of Commons investigated the matter, and its report was issued on June 9 1913 as a White Paper (148). This analysed the evidence with great care, and, as the result, decided that Señor Julio C. Arana (who had come over to give evidence), together with other partners of the firm, was responsible for the atrocities committed by his agents in the Putumayo. The Committee, however, was satisfied that he did not communicate his knowledge of them to the British directors of the company before the *Truth* revelations. These directors were severely censured for culpable negligence in respect of the labour conditions under the company, but it was found that they had not individually laid themselves open to any charge under the Slave Trade Acts. The Committee further reported that existing enactments might be extended so as to cover the gravest offences against the person and against the practices of forced labour which are akin to slavery. A committee, consisting of members of Parliament and others, subsequently met to devise and press forward legislation to this effect; but its labours were interrupted by the outbreak of the World War.

The Putumayo atrocities called attention to the whole system of "loan slavery" and forced labour as practised throughout Latin America. For it was clear that the treatment of the Putumayo Indians was exceptional only in the maddest demonstrations of its inhumanity, and that the slave-driving habit which made it possible was not confined to one region of the continent. The Putumayo region, though vast, is but a small part of the rubber-producing territory of the Amazon; and in all there was evidence that similar conditions prevailed to a greater or less degree. The root of the whole evil was the so-called *patrón* or "peonage" system—a variety of what used to be called in England the "truck system"—by which the employee, forced to buy all his supplies at the employer's store, is kept hopelessly in debt, while by law he is unable to leave his employment until his debt is paid. Not only natives but many foreigners—including British immigrants—have been caught by this system. The *peon* is thus, as often as not, a *de facto* slave; and since in the remoter regions of the vast continent there is no effective government, he is wholly at the mercy of his master. His main safeguard against the worst forms of cruelty is his commercial value; for labour is scarce and, as was said to the present writer by a planter from the Beni in Bolivia, "You do not kill a man who is worth £50."

This safeguard has, however, in effect, proved insufficient; for the rubber-gatherers have been more concerned to make rapid fortunes than to look to the future. One result has been a hideous wastage of labour. In 1906 the Indian population of the Putumayo was estimated to number 50,000; five years later Mr. Casement put it at 10,000 at most; while a writer in the *South American Supplement of The Times* (Feb. 25 1913) spoke of the labour difficulty in the Brazilian rubber districts, due to "the dying-out of the native races from disease and bullets."

That the same process of extermination was proceeding in other districts is shown by a pastoral letter "on the amelioration of the actual condition of our Indians," issued on March 14 1913 by Dr. Manuel Polit, Bishop of Cuenca in Ecuador:—

"Our Ecuadorian Oriente has nevertheless not been free from the man-hunts (*corrias*) and outrages of these inhuman traffickers, rubber-gatherers (*caucheros*) and others, who, ascending unhindered our navigable rivers, have despoiled of their poor possessions and of their liberty hundreds of savage Indians, torturing and killing

those who resist. And if formerly the action of our missionaries, supported by the Government, was able to prevent or to remedy a great part of these evils, nowadays, when the missionary has been expelled, the hunters of men can operate unchecked; and the banks of the Napo, Aguariaco and Curaray, of the Pastaza, Morona and Santiago, have more than once presented scenes similar to those enacted on the Putumayo."

Similar evidence is given in the reports of Padre Estanislao de Las-Corts, Apostolic Prefect of the Caquetá and founder of the Colombian settlement of Puerto Asis on the upper Putumayo, who speaks of "the arms of the devil for dragging the poor Indians down to hell, some with the title of *corregidor*, others calling themselves doctors, and all in league with the *caucheros*, who style themselves *patrónes*."

In addition to the martyrdom and partial extermination of the Amazon Indians, this savage exploitation of the wealth of the Amazon forests has produced another result—the rapid destruction of the wild rubber trees, tapped by unscientific methods, never replaced, and of late years deliberately destroyed by the Indians as the source of all their woes. Many solutions of the problem have been suggested, of which the most notable is perhaps the proposal of an international control of the whole rubber-producing region by a commission representing the Amazon States, and scientific exploitation of these regions by means of imported Chinese and Japanese labour. There are already Japanese colonies on the upper Amazon, and both Chinese and Japanese mix and intermarry freely with the more civilized native "Indians," whose ultimate affinity with the Mongol race is at least highly probable.

The Putumayo revelations led to movements for reform in Latin America itself. Apart from the devoted work of Capuchin Friars, Marist Fathers and Franciscan Sisters in the Colombian districts of the upper Amazon, by the Salesian Fathers in the recently established diocese of Cuenca in Ecuador, by the community of the "Discalced" Franciscans of Lima in Peru, or by the Franciscan missions of Guarayos in Bolivia,<sup>1</sup> lay effort has not been wanting. In Peru the Sociedad Pro-Indígena de Lima took up the cause of the natives with great zeal, and the Colombian and Bolivian Governments both passed remedial legislation. But the Colombian reforms were necessarily limited in scope—and, indeed, till the international boundaries are fixed all effective reform is impossible—while the Bolivian decree of Nov. 25 1913 regulating "loan slavery" remained a dead letter in a country whose vast distances made any effective supervision impossible. To provide that "all contracts between master and man shall be registered at the nearest police office" is not much use in a country where the police offices are scattered hundreds of miles apart, and "where a journey of 200 m. by launch is a serious undertaking, and much more so when runners and canoes are alone available."

**AUTHORITIES.**—Hardenburger, *The Putumayo*; G. Sidney Pater-noster, *The Lords of the Devil's Paradise* (1913); N. Thompson, *The Putumayo Red Book* (1913), inspired partly by desire to vindicate the Colombian claims to the Putumayo region; Joseph F. Woodroffe, *The Upper Reaches of the Amazon* (1914), the outcome of eight years of personal experience; J. F. Woodroffe and H. H. Smith, *The Rubber Industry of the Amazon* (1915). Several valuable articles on the Amazon rubber industry, the peonage system, etc., were published in *The Times South American Supplement* during 1913 (see index, in the issue of Jan. 27 1914). (W. A. P.)

**PYLE, HOWARD** (1853–1911), American artist and writer (see 22.679), died in Florence, Italy, Nov. 9 1911.

**PYROMETRY** (see 22.693).—The term "pyrometer" is now applied to any device intended to measure temperatures beyond

<sup>1</sup> The work of these missions, actively supported by the Government at La Paz, has produced astonishing results. At Urubichá, a "model town," for instance, silverware and jewelry are made, and there are workshops for cutting and polishing ebony to be used in making fine furniture. At Yotau expensive machinery for crushing and refining sugar has been installed. At Ascension carpentry is taught on a large scale. The "Discalced" Franciscans of Lima conduct a flourishing school of agriculture. The Capuchins of Colombia, turned sappers and engineers, constructed a wonderful mule-road over the Andes from Pasto to Mocoa. These and other instances of effective zeal are, however, it must be confessed, exceptions which only serve to heighten by contrast the effect of the inertia of the Church in Latin America.

the upper limit of the mercury thermometer. The success of many metallurgical and other operations carried out in furnaces often depends upon correct regulation of temperature, and for this reason pyrometers are extensively used to control processes conducted at high temperatures. A number of different types of pyrometer are in use, each having its special advantages; and the choice of instrument depends upon the nature of the operation. In order that pyrometers of every pattern may agree in their readings, each is calibrated by reference to a number of fixed points, determined by the gas thermometer. The National Physical Laboratory scale is used in Great Britain, and represents the melting-points or boiling-points of a number of pure materials, chosen so as to be separated by convenient intervals of temperature. Suitable points for graduating pyrometers are the melting-points of zinc ( $419.4^{\circ}\text{C.}$ ), antimony ( $630^{\circ}$ ), common salt ( $801^{\circ}$ ), silver ( $961^{\circ}$ ), copper ( $1083^{\circ}$ ), nickel ( $1452^{\circ}$ ) and palladium ( $1549^{\circ}$ ). Above  $1550^{\circ}\text{C.}$  direct comparison with the gas scale is not possible at present, and instruments designed to read higher temperatures than this are calibrated by reference to the laws of radiation. The features of the different types may conveniently be considered in separate categories.
